"It matters not," he said, "what theory of the origin of government you adopt, if you follow it out to its legitimate conclusions it will bring you face to face with the moral law." "The refusal of our country to protect all men equally in the product of their mental labor, and the consequent practice of reprinting and selling the books of foreigners without asking their consent, or offering them any payment, has been generally regarded as a question of politics, of economy, of national courtesy. But at bottom, as Mr. Lowell has said, it is a question of right and wrong; and therefore it needs to be separated from the confusions of partisanship and the considerations of self-interest, and brought into contact with the Ten Commandments."

But it is not only in the pulpit that ministers can make themselves felt in the reform of public morals, but also in their action and conversation elsewhere,—in becoming, on all proper private and public occasions, advocates of those political and social reforms which all good and disinterested citizens favor the moment that they are brought to their thoughtful attention. Inertia is the friend and promoter of all public abuses. The minister should be among the first to examine the schemes which are constantly being brought forward for the purification of government, throwing aside all that savor of the wild-cat and the crank, selecting those most wise, and earnestly urging their adoption.

There is no reform more pressingly needed throughout the country than that which aims, through legal devices already tested, at the purity of elections. A free ballot is the foundation of modern society; but at this moment, in many cases, how far the ballot is from being free, how foully and effectively the briber does his work, are facts too widely and too hopelessly accepted. A remedy for this state of things is at hand, and the people only need awakening and informing in order that this remedy may be universally applied.*

And there is the reform of the civil service. That reform has in the last dozen years made great advances in legislation, in executive practice, and in the opinion of the public,—but its further extension in legislation and in executive practice is apparently awaiting its further extension in public opinion. The "machine" man of both of the great parties, either privately or publicly, or both privately and publicly, venomously denounces every advocate of the reform, and the very principle involved in the reform. The offices are his tools of trade, and he will not let himself be deprived of them without a furious struggle. Wherever he dares, he sets the principle of the reform at defiance, and even the laws based upon this principle. Those whose desire as well as duty it is to enforce the spirit no less than the letter of the reform programme complain that public sentiment, or, at least, the public sentiment of their particular party, does not at all times and places sustain them in their efforts. Now, waiving the question whether such sustaining should be waited upon,—there can be little doubt that, human nature and politics being what they are, the merit system will not be put into universal practice without a legal necessity. Nor will new laws be passed, extending the system under our city, state, and national government until public opinion is much further advanced on this question than it is to-day. Not only is it unsafe to cease the agitation, but greater efforts than ever must be made if the spoils system is to be thoroughly driven out and away. Organized agencies are at work in this direction, but these can effect little without the spontaneous assistance of the great army of disinterested, public-spirited men and women throughout the country. Every good man and woman can help this initial reform of all political reforms; and perhaps more than all others those natural leaders of the community in whatever is highest and most ideal—the clergy of all creeds and denominations.

Selfishness and Self-Interest.

NOT many distinctions have more difficulty to most men than that which is properly to be made between selfishness and self-interest, as social and economic forces. A sentence in a recent issue of this magazine† may serve as a case in point: "He who has retired with a snug fortune has been engaged in a life-long struggle to provide dry-goods for the public a cent a yard cheaper than they were before." Very many readers will be prompt to object: "He has been doing nothing of the sort; he has been engaged in a life-long struggle to provide dry-goods at the greatest possible profit to himself allowed by competition and the limit which prices put upon sales." And, as the latter statement is in the main correct, it might easily seem to involve the falsehood of the former.

Only the suggestion will probably be needed to show that the two statements are made in regard to entirely different phases of the same series of actions; that the first has regard only to the *consequences* of the seller's life-work, while the second looks as exclusively to the *motive*. The two are not mutually exclusive. The consequence stated in the first, the decrease in the price of dry-goods, might result indifferently either from pure philanthropy or from the seller's eager and intense competition with rival sellers. The motive stated in the objection need not necessarily result in any decrease of price or increase of fortune: it might result otherwise, according to circumstances, either in increase of price or in the bankruptcy of the seller. The two statements, while equally true, are not correlative: those who think only of either as their texture are arguing from different premises and can never come to an agreement, or even to a common understanding. We must either find some statement which shall cover both, or some valid reason why one of the two should be excluded from consideration.

It is easy to see that the essential feature of the counter-statement, the motive of the seller's life-work, is of very great importance in legal discussions, more particularly in criminal law. Every essential feature in the mere act of firing a gun at a crowd of persons may be exactly the same, whether the firing is done by a militiaman under orders, by a peaceful citizen in self-defense, by a passionate man under slight provocation, or by sheer accident or carelessness; the only point to which the law can look in deciding responsibility is the motive which controlled the will in doing the act. It is quite true that the law often seems to regard the consequences rather than the motive; that it will hang a man who sacrifices his child, though the motive of the sacrifice be a religious desire to imitate the purpose of Abraham in the case of Isaac; but this is, after all, rather a judicial decision upon the admissibility of the motive than an examination of the consequences.

In social and economic questions, on the contrary, whether they are considered by themselves or as the basis of legal discussions, the controlling factor is as evidently the consequences of the act. If a contract based on an immoral consideration is voided, it is not by reason of the motives of the parties, but by reason of the consequences to the public; decisions based on "public policy" turn commonly on such social or economic questions. English law once forbade "fore-

† THE CENTURY for April, 1888, p. 963.

stalling, regrating, and engrossing"; that is, roughly, the accumulation of stocks of goods by middle-men in expectation of a higher price. The prohibition has been gradually abandoned, not because the motives of middle-men had become purer, sweeter, or more philanthropic, but because the judges, as they came to understand the course of trade more clearly, began to see that the consequences of the success of such a prohibition would be an increased possibility of famine. The ordinary criterion upon which experience teaches us to rely in such cases is not the motive of the individual who claims a privilege, but the consequences to the public which grants it, either through legal or through social channels.

Much of the fallacy and futility which have crept into the discussion of social and economic questions has come from the admission of an element, the motive of the individual, which, however important in criminal law, is quite out of place here. Very many well-meaning arguments for or against Mr. Henry George's proposal to confiscate rent have been based on the grasping avarice of landlords or of Mr. George; whereas the question is mainly one of consequences, whether the public is benefited by individual ownership or by nationalization of land. Modern society has grown into a stronger anxiety for freedom of individual competition through its clearer perception that the consequences are in the highest degree beneficial to the public and to the world. While the leanings of English law were against the middle-man and his "selfish" efforts to accumulate wealth by anticipating the hunger of his fellow-men, the price of wheat was often at nominal and at famine rates in the same country within a single year. Now a complicated system of daily telegraph reports keeps the whole English-speaking portion of humanity informed as to the demand for wheat in every country, and as to the visible supply, whether in Russia, in the elevators of Dakota or Illinois, or in transit by sea; and the first remote indication of famine turns a great current of food in that direction in which the higher price shows that it is most needed. All this enormous and expensive system has been developed by individuals whose motive, while it may very properly be called "selfishness," so far as they themselves are concerned, must be taken as self-interest alone, so far as the public is concerned with it. The public is of the belief that it is far better served in such cases by the self-interest and consequent competition of individuals than by any governmental agencies. The difficulty with men of socialist leanings — for these far outnumber the down-right and out-right Socialists — is that they look only at the "selfishness" of the middle-man, and are ready to welcome any governmental agency which will, to outward seeming at least, reduce the success of selfishness as an economic force.

Even if we should admit that the substitution of governmental for individual forces would in so far abolish selfishness, we might safely appeal to the experience of the race in support of the assertion that the governmental forces would be inferior in efficiency: self-interest, in the various phases of its operation, has decreased the price of dry-goods far more than any governmental agency ever did while it had the opportunity. But it may be worth while to ask attention to the fact that any such change would not abolish selfishness; it would merely transfer it from the individual

to the government agent. The efficient government agent would be as thoroughly selfish in all his motives for activity as the individual middle-man ever was in his; there would be only a thin veneering laid over the underlying motive, and a decrease in efficiency, which the public would be the first to feel and resent.

It is impossible to exclude selfishness as a social and economic motive; and the public would only waste time by taking into consideration that which it cannot exclude. The choice is between adopting the services of selfish government agents or of selfish individuals; and, as competition can have little effect upon the former, while it works with the very greatest force upon the latter, modern civilization has shown the keenest sense of its own self-interest in its disregard of the individual's selfish motives, and its progressive transfer of more and more of its daily work to individual self-interest and competition. The public, in other words, is not interested in the motive of the individual dry-goods dealer, his desire to make profits, but in the consequence — the decrease of price.

A New Branch of an Old Profession.

In the United States the highest type of mind, especially among men, has not as a rule turned to the teaching profession, because of the inadequacy of its rewards and the uncertainty of advancement. By mere force of habit or custom this tendency away from teaching as a life occupation continues, though the rewards increase in value almost yearly, and promotion is becoming both rapid and sure. The success of the manual-training movement will, it is fair to assume, exert a powerful influence in attracting well trained and broadly cultured men to the service of the school. The ablest graduates of the scientific schools and polytechnic institutes are the men who should respond to the call now being heard all over the country for trained teachers of manual training. Their equipment in drawing, and wood and metal working, when supplemented by a short pedagogic course, is precisely what is required of a principal or instructor in the manual-training school. Furthermore, the salaries attached to these positions are very fair, and will naturally increase as the experience of incumbents makes them more valuable. Mechanics will not do for these positions. Mere tool-men cannot teach. Their sole aim is the finished product, and their method is to urge imitation by the pupil of their own skill. The real teacher of manual training, on the other hand, will desire first of all the development of his pupil, and his method will be to stimulate the student's own activity and power of thought. For him a well-finished product will be but an incident — a necessary incident, it is true — of successful teaching. The well-developed pupil will be the first product for which he will strive.

That this new branch of an old profession is already established admits of no question. Educational thought is all but unanimous in its favor. Public sentiment demands it. Favorable legislative action in New Jersey, and the pending or projected legislation in New York, Pennsylvania, Maryland, and several of the western States, have created a demand for trained teachers of this kind, which it is just now impossible to supply. At least one institution has been established for the purpose of training young men for this

work. It will doubtless be some time before the proper candidates for these positions are forthcoming in sufficient numbers. The lack of rapid adaptability to changed circumstances explains why this expectation is justifiable. Yet the demand will eventually create a supply, and the trained student of nature's forces and materials will find awaiting him a field worthy of his noblest efforts.

For women there is a similar opening. Domestic economy, including instruction in the care, preparation, and constituents of food materials, and sewing, are being offered to girls just as constructive work with tools is prescribed for boys. Careful and systematic teaching is necessary if these branches are to yield the educational results hoped for, and which it is perfectly possible for them to yield. So for women teachers,—and women constitute more than four-fifths of our 320,000 teachers,—there is also an enlarged opportunity. Busy-work, sewing, and cooking will take their place by the side of arithmetic, geography, and history. Already a score or more of cities have schools in which this step has been taken. Everywhere the results are successful. The handling of things stimulates the pupil to careful observation and correct expression. It awakens interest where merely verbal exercises had brought on an intellectual paralysis. It gives power and a consciousness of power. It educates. As one reads the numerous reports on manual training from all parts of the country, New Haven and St. Paul, Albany and Cleveland, New Orleans and St. Louis, and a score more cities and towns, and becomes fully aware of the hold it has gained, he is convinced that for the healthy development of the movement not arguments, but trained teachers, are now necessary.

The Independence of Literature.

THE Rev. Dr. Gladden's "Open Letter" on copyright in this number of *THE CENTURY* makes a needed

explanation of the principle involved in all copyright, as no one can accept the principle of copyright and consistently oppose international copyright. The recent discussion of international copyright has shown the necessity of making clear this principle.

The fact is that the copyright method of supporting and encouraging literary activity is the modern and democratic method as opposed to the ancient feudal method. Either the author must win his living by the simple and easy means of popular sales, or he must, as in the old days, look for his support to some "patron,"—private, ecclesiastical, governmental, or what not. In claiming governmental "protection" by international copyright law American authors have asked not for "patronage" and "protection," as in the old days; on the contrary, they have merely asked for their right to gain their own living unhampered by the unnatural competition of stolen goods. They have asked not for the "protection" of the appraiser, but of the policeman. They wish to be "free" to earn their bread and butter under natural conditions. As Dr. Eggleston said in his speech before the Senate committee, American authors do not ask what several foreign governments give to their authors,—sinecure positions and literary pensions as a means of support; they only ask to be put on the same footing with other workmen. The opposition to international copyright has inevitably ended in denying the principle of all copyright. But when copyright is properly understood it will be found, as we have said above, to be the manly, honest, and democratic method as opposed to the aristocratic and feudal method of supporting the profession of letters.

The independence of literary expression needs to be carefully guarded. "Patronage" is much more out of place in this domain than in that of the plastic arts. Those who have opposed the principle of copyright have been, without knowing it, promoting a tendency which would result in a system reactionary and un-American.

OPEN LETTERS.

The Ethics of Copyright.

THE debate about international copyright has raised the question whether authors, native or foreign, have any rights which the laws are bound to protect. The prompt answer of the advocates of international copyright, when they are challenged to give a reason for their demand, is that the reprinting of an author's books in a foreign country, without asking his consent or offering him remuneration, is an act of piracy; that it is simply helping yourself to another man's property. Mr. Lowell's verse sums up the common argument:

In vain we call old notions fudge,
And bend our conscience to our dealing;
The Ten Commandments will not budge,
And stealing *will* continue stealing.

I confess that to my own mind this has seemed perfectly clear and obvious,—almost axiomatic. But now arise some who dispute all these assumptions. They

deny that the property right expressed in copyright is a natural right; they say that it is only a civil right, the creation of law; that a man has a right to sell his book, but not to monopolize the sale of it; that this right to control the sale is a privilege conferred on him by law; that it may be expedient to extend this privilege to authors, for the sake of encouraging literary production, but that there are no rights in the case except those which are created by the statute. Inasmuch as the statute is in force only within the territory of the State by which it is enacted, no rights are infringed when an author's books, copyrighted at home, are reprinted in a foreign country. The argument for international copyright which rests upon the equities of the case is thus opposed by the assertion that there are no equities in the case; and that while it may be expedient, for public reasons, to extend certain privileges to our own authors, we are under no obligation to extend these privileges even to them; much less to the authors of foreign countries.

The opponents of international copyright, at a convention in Philadelphia, in 1872, issued this manifesto:

"1. That thought, unless expressed, is the property of the thinker; when given to the world it is as light, free to all.

"2. As property it can only demand the protection of the municipal law of the country to which the thinker is subject."

I do not know the name of the humorist who fabricated these propositions, but he must be a very funny fellow. He says that thought can only be property while it remains unexpressed; and that as property it can only demand the protection of the municipal law of the country to which the thinker is subject. This means that a man's unexpressed thoughts are not legally his own when he visits a foreign country. The Englishman who travels in the United States has no right to the protection of our laws in thinking those thoughts which he never expresses! The American, on the other hand, may demand the protection of his own government in thinking, so long as he does not express his thoughts! Just how the Englishman's property right in his own secret thoughts could be invalidated, or the American's confirmed, by statute, this philosopher does not deign to instruct us. But it is pleasant to find this bit of American humor permanently preserved for us in the august pages of the great "Encyclopedia Britannica."

If these American opponents of international copyright are somewhat nebulous in their definitions they are, nevertheless, logical in basing their denial of this right to foreigners upon the theory that no such right exists. That no man, native or foreigner, has any right to control the product of his own mind, after it has been put in print, is an intelligible statement. Most of those who dispute the equity of copyright disagree, however, with the Philadelphia moralists to a certain extent; they insist that an author has a perfect property in his thought after it has been expressed *in writing*; that his manuscript belongs to him, and that the man who steals it from him should be punished. But just as soon as it is put in print they declare that the author ought to have no longer any effective control of it; that it is now "given to the world," and that "it is as light, free to all." "Certainly," they say, "a man has a right to the fruit of his own labor until he has sold it; but when he has sold it, his right ceases and determines." But what does this mean? Sold what? Sold how much?

Suppose that I devote the labor of a year to the writing of a book; and when it is written proceed to print, at my own expense, five thousand copies of the book. The year's labor is presumably worth something; the cost of printing the five thousand copies is, at any rate, considerable. If I can sell this whole edition, I may get profit enough on the sales to pay for the printing and binding, and to afford me some remuneration for the work of writing the book. In all probability the recompense will be very small, not so much as the year's wages of an ordinary mechanic. But, according to the theories of our Philadelphia friends, I ought not to have any legal security whatever in this undertaking. The first copy of this book that is issued from the press may be purchased by some enterprising printer, who sees that there is sure to be a large demand for the book; within a week, in the absence of copyright, he

may put an edition of his own upon the market. He can afford to sell it cheaper than I can, because all he requires is a fair profit on the cost of the manufacture. He seeks no return for the production of the book, which has cost him nothing. Thus he drives me out of the market, and leaves me with my five thousand copies unsold, and my year's work unrewarded. He takes the product of my industry, makes merchandise of it, reaps a large profit from it, and prevents me from obtaining any return for it. And in this, say our Philadelphia philosophers, he violates no rights of mine; because, just as soon as I have sold the first copy of this book, all my rights in the premises are canceled. This seems to me a queer kind of ethics. This book is my product—in a far more profound and comprehensive sense my product than is the bushel of wheat that the farmer has raised, or the horseshoe that the blacksmith has made. It is much more truly a *creation* of wealth than is any material, fabric, or commodity. That it is wealth is proved by the fact that it has exchange value—men are ready to exchange their money for it. The particular collocation of words and sentences which constitute my book is the fruit of my industry. The purchasers and readers of this book, every one of them, owe to me whatever benefit or satisfaction they may derive from the reading of this book. But we are told that a state of things might, with perfect equity, exist, in which the natural remuneration of this industry would be forcibly taken away from me; in which others might enter into the fruit of my labors and prevent me from sharing it; in which others could take the goods provided by me, and enjoy them, and enrich themselves by traffic in them, while I was left without reward. For myself I have no desire to be a citizen of a community in which such views of equity prevail.

That the products of one's brain are as truly his property as the products of his hands seems to me an indubitable proposition. To this the answer is made that spoken words as well as written words could then be copyrighted; that a man might claim the right to prevent others from copying or publishing a speech. Most certainly. That right is enjoyed and confirmed by law in England. A lecture or a sermon may be as distinctly protected by law as is a history or a novel. That is the English law, and the equity is as clear in one case as in another. Suppose I prepare, at the expense of a year's labor, a course of lectures which I wish to deliver at colleges and before lyceums, making them a source of income. Will any one say that a newspaper publisher might equitably send his stenographer to report these lectures at their first delivery, and publish them through his columns and in pamphlet form, thus depriving me of livelihood, and using my labor for his own enrichment? It strikes me that such a proceeding would be highly inequitable. How far the law may undertake to go in securing *speakers* against the appropriation of their utterances by others may be a question. It may be said that the case is one of such difficulty that it is not expedient to attempt the enforcement of these rights; but the equities of the case are clear, and the English law, as I have said, affirms and secures them. I think that the American law could well afford to do the same.

But the very form of the copyright law, it is alleged, shows that this right is only a creation of law; for

copyright runs only forty-two years at the longest; at the end of this time the author's control of the sale of his book is terminated by law. "How," it is demanded, "could a natural right be thus canceled by a statute?"

This question is by some assumed to be unanswerable, but it is not such a poser after all. The right of liberty is conceded to be a natural right, but we have had plenty of statutes in the course of history which canceled that right. Was the existence of the Fugitive Slave Law conclusive proof that the slaves of the South had no natural right to liberty? Suppose we put the question in this way: "What right has the legislature to deprive the author of the right to control the sale of his book after it is forty-two years old?"

It is true that the Constitution of the United States seems to regard copyright as a privilege and not as a right; it is granted, as that instrument phrases it, "to promote the progress of science"; but the Constitution of the United States is not infallible in its ethical pronouncements. What it proclaims to be a gratuity may, after all, be something more than a gratuity.

For one, I am strongly inclined to say that I desire no gratuities or subventions from the Government, and have never considered myself as in any sense the recipient of alms. The small reward that has come to me as an author, through the copyright laws, I have supposed myself to be fully entitled to, not only legally, but also morally. The fact is that the language of the Constitution embodies an unsound philosophy upon this question; it implies that authors are not producers, but paupers. Probably the phraseology of this section has had much to do in vitiating the ideas of our people with respect to this fundamental right. If the Constitution had said that "*in order to promote the raising of wheat*, farmers should be secured, for certain months in the year, against the raiding of their wheat-fields by freebooters," the notion might, perhaps, have been conveyed to the legal mind that farmers had no natural right to the wheat produced by their labor; that property in growing wheat was only a creation of the statute.

A little study of the history of copyright in England might be instructive to those who assume that statutes are the source of all such property. Long before there were any statutes on the subject, authors sued and recovered, under the common law of England, for the infringement of their right to control the publication of their own books. Finally a statute regulating copyright was passed, during the reign of Anne; and in a case arising under this statute it was decided by the judges of the House of Lords, seven to four, that the author and his heirs had, at common law, the sole right of publication forever; but that the statute of Anne had deprived him of this right, limiting his control of the publication of his book to the term of twenty-eight years. So far as English law is concerned, the author's property right was not, then, created or confirmed by statute; it has been limited and curtailed by statute.

But it is said that if the author has the same right to the product of his mind that any workman has to the product of his hands,—if literary property rests on the same basis as other property,—then the author may bequeath this copyright to his heirs forever. Undoubtedly. Such was the common law of England, as we have seen; such was formerly the law of Hol-

land and Belgium, of Denmark and Sweden. In all these countries the right of bequest is now limited, for reasons of public policy. The right to bequeath property of any sort is not a natural right; no man has a right to control his property after he is dead. For certain public reasons, it may be expedient to grant the privilege of bequest; for other reasons, it may be expedient to limit this privilege. But so far as the ethics of the case is concerned, literary property must stand or fall before the laws of bequest with every other kind of property.

In England, at the present day, the copyright is vested in the author until his death, and in his heirs for seven years after his death, unless this term of seven years shall expire before the end of forty-two years from the first publication of the book; in which case it is extended to forty-two years. A book published after the author's death by his heirs is secured by copyright for forty-two years. This is the shortest period of English copyright: while if an English author publishes a book at the age of twenty and lives to be eighty years old, the copyright of this book runs for sixty-seven years. In most other civilized countries the copyright is continued for a considerable period after the author's death: in France and Spain, for fifty years; in Prussia and Austria, for thirty years; in Holland and Belgium, for twenty years.

It is said that copyright is a monopoly, and, for this reason, ought not to be tolerated by the State. But it is not a monopoly in the ordinary use of that word. Certain publishing rights that were monopolies were granted in former days in England: to one man was given by law the exclusive privilege of printing the Bible; to another, all law books; to another, all music books; to another, all almanacs. But this is a very different matter from permitting an author to control the publication of his own books. If I write a history of Ohio, my copyright does not forbid any other man to write or publish the history of Ohio: every man in the State may write and publish such a history if he chooses. Nor does my copyright bind anybody to purchase my book, or guarantee any market for my book. It simply says, "This particular history of Ohio, which this man has written, is his property: no man can print or publish it for a term of forty-two years without permission from him; you are under no obligation to use his book; but if you do so you must make your bargain with him, or with those whom he empowers to act for him." It seems to me that this is no more a monopoly than the right of the shoe manufacturer to contract for the sale of the shoes manufactured by him is a monopoly. It is the right to control the sale of his own product.

I come back, therefore, to the ground from which I started, finding that it is well taken and strongly fortified by reason and experience. The author's property in his book is of the same nature as that of any other worker in his product. The protection of this property is not a gratuity conferred on him by the State for the promotion of literature or learning; it is a right to which he, with every other producer, is entitled. The author is not a mendicant or a pensioner; he wants no favors; all he wants is justice—to enjoy the fruit of his own labors. That he is entitled to this as long as he lives seems obvious; the law of nearly every civilized country, except America, confirms this right.

How long this property shall be extended after his death is a question of expediency; all laws regulating bequest are based upon expediency.

One reason why our legislators have been so slow to grant international copyright is found in the prevalence of the false notion that the author has no valid claim even upon his own government for the protection of his property; that the power to control the publication of his own works is not a right secured to him, but a privilege conferred on him.

Washington Gladden.

COLUMBUS, OHIO.

The Story of the First News Message ever sent by Telegraph.

ON the morning of May 1, 1844, the Whig convention organized in Baltimore, and working connection was established for the first time by telegraph between Washington and Annapolis Junction, Professor Morse being at the former and Mr. Vail at the latter place. Morse sat that afternoon in the room at Washington, waiting for the signal from Mr. Vail, when suddenly there came an animated clicking at the instrument. He bent forward, in his eagerness almost devouring the little strip of paper that crept only too slowly from between the rollers of the register, until, the message completed, he rose, and said to the friends who were present: "Gentlemen, the convention has adjourned. The train for Washington from Baltimore, bearing that information, has just left Annapolis Junction, and Mr. Vail has telegraphed me the ticket nominated, and it is" — he hesitated, holding in his hand the final proof of the victory of science over space — "it is—it is Clay and Frelinghuysen!"

"You are quizzing us," was the quiet retort. "It's easy enough for you to guess that Clay is at the head of the ticket; but Frelinghuysen — who the devil is Frelinghuysen?"

"I only know," was the dignified answer, "that is the name Mr. Vail has sent me from Annapolis Junction, where he had the news five minutes ago, from the train that is bound this way, bringing the delegates."

In those days the twenty-two miles from the Junction to Washington required an hour and a quarter in making, even for the exceptionally fast trains, such as that which was taking the delegates to Washington.

Long before the journey was over, the newspapers — enterprising even in those days — had "extras" upon the streets, and the newsboys were lustily crying the news the telegraph had brought flashing through *twenty-two* miles of space. A great crowd of people was at the station. The extras, with their cabalistic heading, "By Telegraph," had whetted public curiosity to the keenest edge. Out of the train came the delegates, each one anxious to be foremost in sending abroad the inspiring news that fortune was with "Harry of the West." But consternation struck them dumb when, upon alighting, they found in type, before their eyes, the very story they had believed exclusively their own, but which had preceded them "By Telegraph," as they read in the head-lines of the journals. They had seen the wires stretching along the side of the track all the way from Annapolis Junction into Washington, and they had joked about it glibly.

The Hon. Ralph Plumb, a member of the present Congress from Illinois, was one of the delegates from Ohio to that Clay convention, and was on the train which bore the first news of the nominations, as was supposed, to Washington, and in a communication to the writer, under date of Washington, February 18, 1888, he writes: "It seems like a real romance to me to think that a son of the then young man who was sending what may fairly be said to have been the *first important message by telegraph that was ever transmitted*, is asking of *one yet alive* respecting what happened on that occasion. Daring these forty-four years, see what has been accomplished, as a result of this first successful effort! What civilized country is there now that has not the telegraph, and how many of them are covered by telegraph lines as by a network!"

In referring to the journey from Baltimore to Washington of the delegates to the convention at Baltimore, he says: "I remember the little shed at the Junction where we stopped on our way, and I saw the man (Mr. Vail) in it, who was ticking away upon a little brass machine. I saw him, and I talked with him, for I wanted to know what strange thing he was doing; and he answered that he was 'telegraphing to Morse in Washington about our convention,' — and he pointed towards the wire overhead, running in the direction of that city, — 'over the first wire ever erected or used for public telegraphing, and the message I have just sent is the first news ever transmitted for the public benefit.' In common with all the rest of the *real wise* ones of the day, I hailed the affair as a huge joke until we landed at the station in Washington, when, sure enough, Morse had received the news an hour or more before, and the whole city was informed of the fact that we had put a dark horse on the ticket with our hero, Clay. The evidence could not be disputed, of course. The most prejudiced of us could not presume to suggest that Morse's work was guessing; for no man alive would have imagined that Frelinghuysen could be made the nominee for Vice-President."

Mr. Vail preserved with much care the recording-register used by him at Washington and Annapolis Junction, and later at Baltimore, as a priceless memento of the days of which we have written, and at his death bequeathed it to his eldest son, Stephen Vail, by whom it was loaned, some years since, to the National Museum at Washington, where it has attracted much attention. Professor Morse, some years before his death, certified to its identity, and to the fact that the similar one used by him at his end of the line had not been preserved, and that he did not know what had become of it.

S. V.

The Postal Service.

THE postal service presents two distinct problems to the civil-service reformer: one as to the large post-offices in the cities, and quite another as to the fifty thousand small offices scattered through the country.

As to the first class, the beginnings of a solution have been made. The system of competitive examination is being applied with success to the selection of clerks and subordinate employees. We have made less progress in the selection of the postmasters themselves, the heads of the large offices; yet there has been an advance, and there is the prospect of a further

advance. The one thing here to be insisted on, to be impressed on public opinion and forced on public men, is that the management of a great post-office is a specific business requiring training and experience, and not fit to be intrusted at hap-hazard to any active politician or broken-down business man who happens to have friends at court. This branch of the postal service should be treated as a separate profession, such as it is. It is sharing in the development which is taking place in almost all branches of industry—the development towards specialization. In all directions, business is becoming more technical, and new professions are arising. Railroading is now a business by itself; so are the various branches of manufacturing; the management of a public library is becoming a distinct profession. Everywhere the general rule is that men must begin at the bottom, and work their way by promotion towards the top. In the postal service, as elsewhere, those should be appointed to the higher administrative positions who have shown capacity and have acquired training in the lower. The Administration has followed this principle in the selection of Mr. Pearson in New York. Unfortunately the principle is not yet imbedded in our habitual attitude towards government administration, and we must wait for the gradual hardening of public opinion on civil-service reform before we can expect its uniform and consistent application. It is to public opinion rather than to legislation that we must look, in the main, for this result; for the need of regarding the personal equation in positions of management and responsibility stands in the way of setting up for these offices any machinery like that of competitive examinations. Yet the end would be furthered by the repeal of the irrational statute that limits to four years the terms of postmasters appointed by the President.

As to the small offices, where the salary is less than \$1000 and the appointment is made by the Postmaster-General, nothing has been done. The plan of competitive examination is again not readily applicable; not because an examination would fail to test sufficiently well the qualifications of candidates, but because so many examinations would be necessary, and in so many different places at different times, that the system would be too cumbersome. Some other device for applying reform principles must be sought, and various plans have been suggested. It has been proposed that the postmaster be elected; but this, quite apart from constitutional difficulties, would serve only to throw another prize into the scramble for party nomination and election, and surely would fail to bring about the essential end—the separation of offices from politics. A system of boards or commissions, one for each State or judicial circuit, has been brought forward, the members to be appointed by the Civil-Service Commissioners and to have the duty of recommending to the President and Postmaster-General fit persons for the smaller post-offices. Such a scheme was advocated in this magazine for May, 1883. A strong objection against it is that everything is necessarily left to the judgment of the local commissioners, the machinery not being self-acting, like that applied by the existing Federal and State commissions. It would, moreover, subject the present Federal commission to a strain similar to that felt by the judiciary when judges are called

on to make appointments: the appointing office, which has patronage and discretion, becomes a prize for politicians, and a tempting point of attack for those who wish to evade the spirit of the law. Another proposed remedy is the rigid prohibition of advice or solicitation by congressmen to the Postmaster-General; and no doubt some good would be done in that way.

But at bottom, here and everywhere, the essential thing is to bring a strong public feeling to bear in favor of non-partisan appointments. Methods of competitive examination aid such a feeling in working out its object, in those cases where they can be brought to bear. Where that or any other intermediate machinery is inapplicable, as seems to be the case with the fourth-class postmasterships, the fundamental agency of public opinion must act directly.

F. W. Taussig.

The Prohibition of Railway Pools.

OBSERVERS have noted the present tendency of opinion towards an increasing interference with or control of public industries on the part of government; or, in other words, the spread of state socialism. The message of Mayor Hewitt advocating the building of rapid-transit lines by the city of New York is a striking illustration. Ten years ago such a proposal would have been met with a great outcry, with an insistence upon the Jeffersonian maxim, "That government is best which governs least," and with a warning that we were departing from the democracy of our fathers. The New York and Brooklyn Bridge does not earn interest upon its cost, and hence all real estate is taxed to provide comparatively free transportation for a certain portion of our citizens. The bridge and the rapid-transit plan excite no opposition as to the principle, but only as to details. From such instances as these to the state management or more strict control of our other public industries, like the telegraph and the railroads, is a step of little difficulty as to the theory, however great the practical difficulties may be.

No section of the interstate commerce law has met with more censure on the part of some students of our transportation problem than the one prohibiting railroad pooling. Pools, they say, have brought uniformity and comparative steadiness into our railway system where everything before was chaotic: pool failures arose from the fact that they could not enforce their agreements; hence the solution of our difficulties lay in legalizing, not abolishing, these combinations. The credit claimed for the pooling system in bringing harmony of administration out of confusion is justly due it. But transportation methods should be evolutionary, and it may well be that we should now pass beyond pooling and allow pool questions—the division of the traffic and the fixing of rates—to be settled by more natural methods and through more real competition. The legitimatizing of railroad combinations by law would shortly compel the direct interference of the same law-making power with the tariffs or special rates of the pools thus legalized, for logically Congress would be held responsible for any and all transportation charges made by its creatures. This would be a long step towards strict control and eventual ownership. As matters stood at the time of the passage of the interstate commerce act, the pools were gaining strength greatly,

so much so that astute men were looking forward to a pool of pools which should cover the larger part of the country. Even allowing for the indirect competition of our water-ways, there would be power enough in such a gigantic pool, when formed, to require governmental action to restrain it. In this view of the case the prohibition of pools might be described as an effort of the American people to avert government ownership, or, at least, exacting regulation of railroads.

We are witnessing a struggle between the theories of competition, or individualism, on the one hand, and on the other of state control of those monopolies which are public in their character and chartered by the Government. As before remarked, in municipal affairs we are rapidly deciding against individual and in favor of city administration. Around the railroads of the country will finally be fought a battle which, on account of the difficulties and conflicting interests involved, will be the fiercest of all. If this prohibition of pooling, which is but an experiment, shall prove disastrous to investments and to commerce through repeated railway wars; or if, which is its undoubted tendency, it unduly favor a consolidation of existing independent lines into fewer great systems, so as thus in time to defeat its own hopes of introducing enough honest competition to be a regulator of charges; if, in short, we must confess that the abolition of a division of the earnings between rival railroads has proved a failure, then the great question of individual versus governmental control of transportation will be upon us: if this question be squarely presented to our citizens, judging from the present aspect of affairs, we cannot doubt what the issue will be. The prohibition of railroad pooling, it is to be hoped, will at least postpone that conflict until, through a better civil service and in other ways, the nation is ready for the question.

The legalizing of pools would have precipitated the struggle; ignoring them would have delayed it; prohibiting them has postponed and may avoid it: while in the event of its coming we have the satisfaction of knowing that we have done what we could towards keeping the simpler forms of our government.

Thomas L. Greene.

Matthew Arnold and Franklin.

IN the reference to Franklin's project for a new version of the Book of Job (quoted by Burroughs in the *JUNE CENTURY*, p. 189) Matthew Arnold has rather ludicrously mistaken the entire point of Franklin's *jeu d'esprit*, a little satire on the court of George III., for such only it was, and as far as possible from a serious project for a new version of the Book of Job. Franklin, under pretext of modernizing the language of the Bible, sought to expose the purely selfish character of the devotion of the English courtiers to their sovereign and the degrading terms upon which only that devotion was perpetuated.

The point is disclosed in the last three verses of his paraphrase:

"9. And Satan answered, Does your Majesty imagine that his good conduct is the effect of mere personal attachment and affection?

"10. Have you not protected him, and heaped your benefits upon him, till he is grown enormously rich?

"11. Try him. Only withdraw your favor, turn him out of his places and withhold his pensions, and you will soon find him in opposition."

John Bigelow.

Mary Magdalene.

THE Rev. D. H. Temple, of Los Gatos, California, having taken exception to Mr. Kennan's allusion (in his article on Russian State Prisons, in the *MARCH CENTURY*) to Mary Magdalene as the woman of whom Christ said, "She hath done what she could," Mr. Kennan writes as follows:

The Rev. Mr. Temple seems to be right about Mary Magdalene; but as the mistake is a very old and a very general one, and has even gotten itself entrenched in literature and in art, I trust that I shall be excused for the slip. The old masters often represented Mary Magdalene with long and abundant hair and with a box of ointment in her hands. (See Brewer, under head of "Mary Magdalene.") Furthermore, if Mary Magdalene was not the woman referred to by Luke as anointing Christ's feet, then there is not so much as an intimation in all the New Testament that Mary Magdalene was a repentant courtesan; and the artists and lexicographers are all wrong in calling a certain class of women "Magdalens." If the woman with the ointment was not Mary Magdalene, then Mary Magdalene was not the repentant sinner, since both suppositions rest upon precisely the same evidence.

It is manifest upon investigation that for many centuries at least the sinful but repentant woman who anointed Christ's feet, as described in Luke vii. 37-50, has been erroneously confused with Mary Magdalene. Even Brewer says, "Mary Magdalene, patron saint of penitents, being herself the model penitent of Gospel history." This is not true, unless the woman who anointed Christ's feet and wiped them with her hair, as related by Luke, was Mary Magdalene.

I am satisfied upon examination, first, that Mr. Temple is right; secondly, that the Gospels contain accounts of at least two anointings by different women; thirdly, that neither of these women was intended by the chronicler for Mary Magdalene; and fourthly, that Mary Magdalene was neither the anointer nor the repentant courtesan, although she has, for centuries, been regarded, described, and pictured as both.

On this subject a Bible commentator writes to us:

I do not think there is anything more to say than that Mr. Kennan, in his letter, has correctly stated the facts. Mary Magdalene is described as a woman out of whom Jesus cast seven devils; and has been ecclesiastically identified with the "woman which was a sinner" who anointed Christ's feet with an ointment, etc. (Luke vii. 36-50). But there is no reason whatever for identifying Mary Magdalene with this woman. This anointing, again, is by some critics identified with the anointing by Mary, the sister of Martha, described in Matthew, chapter xxvi., Mark, chapter xiv., and John, chapter xii. Nearly all evangelical critics, however, and I think all the better biblical scholarship, regard these as two distinct anointings. Thus there is no reason for supposing that the Mary of whom Christ said, "She hath done what she could," is the "woman which was a sinner," and none whatever for supposing that the "woman which was a sinner" is to be identified with Mary Magdalene. Mr. Kennan's slip, however, is wholly immaterial and one hardly now calling for any correction. If you thought otherwise, you could not make the correction better than by quoting from Mr. Kennan's letter, which I return to you herewith.

"We-uns" and "You-uns."

I HAVE noticed that some writers in *THE CENTURY* make Southern people say "we-uns" and "you-uns." This is notably the case in the "Recollections of a Private," by Warren Lee Goss. Mr. Goss attributes this peculiarity of speech to the people of one of the Virginia peninsulas, consisting of the counties of Elizabeth

City, Warwick, York, and James City. I was born and reared in Gloucester County, which is separated from York and James City counties by the York River. I know the people of those counties. I have taught in two counties of Virginia, and I also taught some months in South Carolina. I spent several months in Florida in 1883. While at college in Richmond, Va., I met representatives from every section of this State. I know all classes of people in Tidewater Virginia, the uneducated as well as the educated. I have never heard any one say "we-uns" or "you-uns." I have asked many people about these expressions. I have never yet found any one who ever heard a Virginian use them. The people of Tidewater Virginia have some provincialisms, but on the whole they use better English than is generally spoken in the United States.

GLOUCESTER C. H., VA.

Lincoln and Secession.

WHEN Mr. Lincoln asked those suggestive questions as to the relative rights of State and county, pointing the inevitable conclusion that if a State were permitted to treat the bond between itself and the General Government as "no regular marriage, but a sort of free-love arrangement," * then a county might assume that its relation to the States was of the same nature, he per-

haps had no thought that before the end of the year the logic of his deduction would have the attestation of fact. But one county at least did so interpret and practice the doctrine of secession. When Tennessee was halting between loyalty and rebellion, the secession element grew very impatient; and in Franklin County, on the southern border of the State, this impatience finally culminated in an indignant county convention, and the passage — by acclamation, I believe — of "a solemn ordinance of secession from the State of Tennessee."

That it did not indulge in mere idle vamping, the county gave prompt proof by putting into the field a force equal to two-thirds of its entire voting population.

Amidst the exciting events and rapidly moving scenes of that first act in our great drama, this rather comic-looking bit of tragedy (the actors found it to be that) escaped general notice.

But it is interesting as another illustration of Mr. Lincoln's unflinching clear-headedness. It gives curious proof, too, of the madness that was then epidemic in even the more sober-minded of the Southern States.

M. C. Roseboro.

BRIC-À-BRAC.

Folly Land.

IN Folly land what witchery!
What pretty looks, what eyes there be;
What gamesome ways, what dimpled smiles;
What lissome limbs, what frolic wiles;
What easy laughter, fresh and clear;
What pranks to play, what jests to hear!
Old Time forgets to shake his sand;
The Days go tripping, hand in hand,
In Folly land, in Folly land.

In Folly land, one idle hour,
The moonlight had a wizard power;
Its fairy glamour turned my brain:
I would that I were there again!
We stood together, 'neath the sky;
A bird was chirping drowsily;
He smiled, he sighed, he held my hand.
Ah me! Ah well, — we understand,
'T was Folly land, 't was Folly land!

My sober friend, how worn your looks!
Your heart is in your moldy books.
Here 's half a cobweb on your brow!
I seldom see you jovial now.
Fling down your volumes and be free
To take a pleasure-trip with me.
Come, "Here 's my heart, and here 's my hand!"
We 'll launch our skiff, and seek the strand
Of Folly land, of Folly land.

Danske Dandridge.

Uncle Esek's Wisdom.

THE man who knows the most of himself is the best judge of his neighbor.

WHAT mankind want is mercy. Justice would ruin most of them.

HABITS, reputations, and opinions are ever changing, but character is always the same.

THERE are heroes in every department of life, — a faithful servant is one of them.

HE who is a fool and knows it can very easily pass himself off for a wise man.

THE man who has a little more to do than he can attend to has no time to be miserable in.

IT may be possible for three persons to keep a secret, provided two of them are dead.

METAPHYSICS seems to be the science of knowing more than we can tell, and at the same time telling more than we know.

WHATEVER we get in this world we not only have got to ask for, but to insist upon; giving away things is not a human weakness.

THE city is the place to study character. After you have measured the postmaster, the blacksmith, and the justice of the peace in the country village, you have got the size of the whole town.

Uncle Esek.

To J. W. R.

IN summer I 'm a-raisin' flowers,
An' gardenin', an' weedin',
But durin' o' the winter hours
I do a deal o' readin';
An' the 's one man with sech an art
O' settin' thoughts a-rhymin',
Ez makes a feelin' in my heart
Ez sweet ez bells a-chimin'.

I read a piece o' his to-day
(It 's goin' 'round the papers)—
The words wuz dancin' all the way
An' cuttin' happy capers,
An' shinin' up to meet my eye
Jes like my blushin' roses
A-smilin' as I pass 'em by—
The dearest o' my posies.

A-hummin' right along it goes,
Like bees among the clover;
It says the honeysuckle-blows
Are vases tippin' over
An' spillin' odors all around
Upon the breezes floatin'.
That 's jes the sense, an' not the sound —
I 'm ruther poor at quotin'.

One piece was in a magazine,
It made my old eyes water
(The man with naught to say, I mean,
Who said it to his daughter);
But when I read, "Take keer yerse'f,"
An' how poor Jim lay dyin',
I flung the paper on the shelf
An' boo-hoed ont a-cryin'.

I 'm jes a plain, hard-workin' man
An' lackin' eddication,
An' writin' things ez some folks can
Puts 'em above my station;
But, arter all, I 'm some like him
Whose rhymin's please me highly,
For jes to think I *ain't* like him
Does sort o' make me Riley.

Patty Caryl.

Mac's Old Horse.

WHAT horse is that away by the railin',
Lookin' so gayly, an' sleek, an' fat?
Great Scotland, man! Why never, surely!
You can't be askin' what horse is *that*!
Not know *him*? Old Billy? Mac's pony!
Whar'd you come from, stranger — say?
Some outlandish divide, I reckon,
Or else you 'd a-hearn o' the good old bay.

New to the country, I 'm thinkin', stranger?
Tenderfoot! Fresh on the range, o' course.
There is n't a fellow in western Texas
But tumbles to chat about that old horse.
A good one? Yes, he 's a dandy, surely;
They raise none better whar that un grew,
Mac an' the boys would smile to hear me
Introducin' *that* nag to you.

A pioneer? Well, I should n't wonder
If he was a sort of a one out here.
Mac's own "locate" ain't a recent issue,
And Billy 's beat him a good nine year.
Thar is n't a trail on the prairie yonder,
Rollin' away thar beyond your view,
Nor a wagon track, nor a foot of country,
Unfamiliar to that old shoe.

Knowin'? You bet! Why, the boys was tellin'
A tale o' the old horse here one day,
That freezes intelligence merely human
Out of the country — clean away.
Anxious to hear it? Well, r'a'ly, stranger,
I 'm green at the business o' yarnin' — still,
If you 're sot — Here 's luck! Now yer pipe needs fillin';
Fasten yer boots to the window-sill.

More than a year agoe this season
Mac was abroad on a big survey,
Away beyond the Canadian country
Campin' out with the good old bay.
The feelin' a man on the border ranges
Gives to his horse is a love so true,
An' stout o' grip, that an Eastern coot, sir,
Could n't begin fur to gauge it through.

Darkness out on the prairie, stranger,
Drops on the earth like a funeral pall,
An' travelers peltin' along seem horin'
A tunnel out through a big, black wall.
It 's lonely, too, in the depth o' midnight,
When stars up yonder are burnin' din
An' the wind an' you are the sole things movin'
In the belt o' the far horizon rim.

Over the border ranges speedin'
Mac an' the outfit came that night,
Strainin' to make the post by daybreak —
Ridin' by faith, fur the lack o' sight.
Splittin' along through the dark an' silence
All of a sudden the old bay horse
Stood in his tracks like a graven image,
Thar in the midst o' his headlong course.

Mac, he coaxed, an' he spurred, an' grumbled,
Billy was holdin' the fort, you bet;
Muscles steady, an' sinews strung, sir,
Head thrown back 'rd, an' forefeet set.
Mac cussed hard as he peered around him,
Nary a thing could he find or see;
Never a ghost, nor a witch, nor spirit,
Nor even the trunk of a blasted tree.

Well, sir, findin' the horse meant business,
Mac dismounted an' rustled round,
Huntin' a hole, or an old dog village,
Or anythin' else to be felt or found;
An' thar right away in the track before him
The prairie yawned, an' the ground just fell
Sheer in a cañon a hundred fathoms —
Deep an' black as the mouth of hell.

Killed? Well, I reckon a fall like that, sir,
Over the side of a cañon wall,
Ain't quite so healthy a pastime, maybe,
As shakin' a leg at a rancher's ball.
An' sure as a gun, that night I tell of,
Mac an' the brute would 'r shaped a course,
Freight close laid, fur a better country,
But fur the sense o' the old bay horse.

Sell that horse! Old Billy! Now, stranger,
You must be runnin' insurance high
To ask a question like that in Texas,
An' look to a man for a soft reply:
Or else you 're jokin'! A poor jest, surely,
An' one unbecomin' a man to make;
I would n't repeat it to Mac exactly,
Unless I was willing to move my stake.

M. G. McClelland.

[A crude version of the above by the author appeared in a newspaper several years ago.]

Gladness.

My ole man named Silas: he
Dead long 'fo' ole Gin'l Lee
S'rendah, whense de Wah wuz done.
Yanks dey tuk de plantation—
Mos' high-handed evah you see!—
Das rack roun', an' fiah an' bu'n,
An' jab de beds wid deir baynet-gun,
An' sweah we niggahs all scotch-free.—
An' massah John C. Pemberton
Das tuk an' run!

"Gord Almighty, marm!" he 'low,
"He'p you an' de chillen now!"
Blaze crack out 'n de roof inside
Tel de big house all das charified!
Smoke roll out 'n de ole hay-mow
An' de wa'house do'—an' de fiah das roah—
An' all dat 'backer, 'bout half dried,
Hit smell das fried!

Nelse, my ol'est boy, an' John—
Atter de baby das wuz bo'n,
Erlongse dem times, an' lak ter a-died,
An' Silas he be'n slip an' gone
'Bout eight weeks ter de Union side,—
Dem two boys dey start fo' ter fine
An' jine deir fader acrost de line.
Ovahseeah he wade an' tromp
Evah-which-way fo' ter track 'em down—
Sic de bloodhoun' fro' de swamp—
An' bring de news dat John he drown'—
But dey save de houn'!

Someway ner Nelse git fro',
An' fight fo' de ole Red, White, an' Blue,
Lak his fader is, ter er heart's delight—
An' nen crope back wid de news, one night,
Sayes, "Fader 's killed in a skrimmage-fight,
An' saunt farewell ter ye all, an' sayes
Fo' ter name de baby 'Gladness,' caze
Mighty nigh she 'uz be'n borned free!"
An' de boy he smile so strange at me
I sayes, "Yo 's hurt, yo'se'f!" an' he
Sayes, "I 's killed, too—an' dat 's all else!"
An' dah lay Nelse!

Hope an' Angrish, de twins, be'n sole
'Fo' dey mo 'n twelve-year-ole:
An' Mary Magdeline sole too.
An' dah I 's lef', wid Knox Andrew,
An' Lily, and Maje, an' Margaret,
An' little gal-babe, 'at 's borned dat new
She scaisely ole fo' ter be named yet—
Less 'n de name 'at Si say to—
An' co'se hit do.

An' I taken dem chillen, evah one
(An' a-oh my Mastah's will be done!),
An' I break fo' de Norf, wha dey all raised free,
(An' a-oh good Mastah, come git me!)
Knox Andrew, on de day he died,
Lef his fambly er shop an' er lot berside;
An' Maje die ownin' er team—an' he
Lef all ter me.

Lily she work at de Gran' Hotel—
(Mastah! Mastah! Take me—do!)
An' Lily she ain' married well—
He stob a man—an' she die too;
An' Margaret she too full er pride
Ter own her kin tel er day she died!
But Gladness!—'tain soun' sho-nuff true,
Yit she teached school!—an' er white folks, too,
Ruspec' dat gal 'mos' high es I do!

Caze she uz de bes' an de mos' high bred—
De las' chile bo'n, an' de las' chile dead
O' all ten head!

Gladness! Gladness! a-oh my chile!
Wa'm my soul in yo' sweet smile!
Daughter o' Silas! o-rise an' sing
Tel er heart-beat pat lak er pigeon-wing!
Sayes, O Gladness! wake dem eyes—
Sayes, a-lif dem folded han's, an' rise—
Sayes, a-coax me erlong ter l'aradise,
An' a-hail de King,
O Gladness!

James Whitcomb Riley.

The Way to Win.

If on the field of love you fall,
With smiles conceal your pain;
Be not to Love too sure a thrall,
But lightly wear his chain.
Don't kiss the hem of Beauty's gown,
Or tremble at her tear,
And when caprices weight you down,
A word within your ear:
Another lass, another lass,
With laughing eyes and bright—
Make love to *her*,
And trust me, sir,
'T will set your wrongs aright.

Whene'er a sweetheart proves unkind
And greets you with a frown,
Or laughs your passion to the wind,
The talk of all the town,
Plead not your cause on bended knee
And murmured sighs prolong,
But gather from my minstrelsy
The burden of my song:
Another lass, another lass.—
There 's always beauty by,—
Make love to *her*,
And trust me, sir,
'T will clear the clouded sky.

Samuel Minturn Peck.

Minnie vs. Minerva.

"LOVE me and I will bring you as my dower
Knowledge and wisdom and perpetual power."
So speaks Minerva of the azure eyes,
Wooing me boldly to be overwise.

Now, Minnie, who is not a Grecian myth,
But a young lady by the name of Smith,
Never says "Love me" in so bold a way,
But when I rise to leave her begs me stay;
Blushes, or pales a little, and lets down
Her long black lashes o'er her eyes of brown.

And so I linger; though I must admit,
Delicious nonsense is her highest wit;
And what she does n't know would fill more books
Than Boston's library holds in all its nooks.
Yet the good humor of her turned-up face
Outshines Minerva's mass of marble grace;
And in the race for this weak heart of mine
Between fair Minnie and Minerva fine,
Although to jilt a goddess were a sin,
I'm very much afraid that Minnie 'll win.

THE CENTURY MAGAZINE.

VOL. XXXVI.

AUGUST, 1888.

No. 4.

A HOME OF THE SILENT BROTHERHOOD.

THE ABBEY OF LA TRAPPE IN KENTUCKY.

MORE than two hundred and fifty years have passed away since the Cardinal de Richelieu stood at the baptismal font as sponsor to a name that within the pale of the Church was destined to become more famous than his own.

But the world has well-nigh forgotten Richelieu's godson. Perhaps only the tireless student of biography now turns the pages that record his extraordinary career, ponders the strange unfolding of his moral nature, is moved by the deep pathos of his dying hours. The demands of historic clearness and perspective which enforce some mention of him here may not, therefore, appear unfortunate. Dominique Armand-Jean le Bouthillier de Rancé! How cleverly, while scarcely out of short-clothes, did he puzzle the king's confessor with questions on Homer, and at the age of thirteen publish an edition of Anacreon! Of ancient, illustrious birth, and heir to an almost ducal house, how tenderly favored was he by Marie de Médicis; happy-hearted, kindly, suasive, how idolized by a gorgeous court! In what affluence of rich laces did he dress; in what irresistible violet-colored close coats, with emeralds at his wristbands, a diamond on his finger, red heels on his shoes! How nimbly he capered through the dance with a sword on his hip! How bravely he planned quests after the manner of knights of the Round Table, meaning to take for himself, doubtless, the part of Lancelot! How exquisitely, and ardently, and ah! how fatally he flirted with the incomparable ladies in the circle of Madame de Rambouillet!

And with a zest for sport as great as his unction for the priestly office, how wittily — laying one hand on his heart and waving the other through the air — could he bow and say, "This morning I preached like an angel; I'll hunt like the devil this afternoon!"

All at once his life broke in two when half spent. He ceased to hunt like the devil, to adore the flesh, to scandalize the world; and retiring to the ancient Abbey of La Trappe in Normandy, — the sponsorial gift of his Eminence and favored by many popes, — there undertook the difficult task of reforming the relaxed Benedictines. The old abbey — situated in a great fog-covered basin encompassed by dense woods of beech, oak, and linden, and therefore always gloomy, unhealthy, and forbidding — was in ruins. One ascended by means of a ladder from floor to rotting floor. The refectory had become a place where the monks assembled to play at bowls with worldlings. The dormitory, exposed to wind, rain, and snow, had been given up to owls. Each monk slept where he could and would. In the church the stones were scattered, the walls unsteady, the pavement was broken, the bell ready to fall. As a single solemn reminder of the vanished spirit of the place, which had been founded by St. Stephen and St. Bernard in the twelfth century, with the intention of reviving in the Western Church the bright examples of primitive sanctity furnished by Eastern solitaries of the third and fourth, one read over the door of the cloister the words of Jeremiah: *Sedebit solitarius et tacebit*. The few monks who remained in the convent were, as Chateaubriand says, also in a state of ruins. They preferred sipping ratafia to reading their breviaries; and when De Rancé

undertook to enforce a reform, they threatened to whip him well for his pains. He, in turn, threatened them with the royal interference, and they submitted. There, accordingly, he introduced a system of rules that a sybarite might have wept over even to hear recited; carried into practice cenobitical austerities that recalled the models of pious anchorites in Syria and Thebais; and gave its peculiar meaning to the word "Trappist," a name which has since been taken by all Cistercian communities embracing the reform of the first monastery.

In the retirement of this mass of woods and sky De Rancé passed the rest of his long life, doing nothing more worldly, perhaps, than quoting Aristophanes and Horace to Bossuet, and allowing himself to be entertained by Pellisson, carefully exhibiting the accomplishments of his educated spider. There, in acute agony of body and perfect meekness of spirit, a worn and weary old man, with time enough to remember his youthful ardors and emeralds and illusions, he watched his mortal end draw slowly near. And there, asking to be buried in some desolate spot,—some old battle-field,—he died at last, extending his poor macerated body on the cross of blessed cinders and straw, and commending his poor penitent soul to the pure mercy of Heaven.

A wonderful spectacle to the less fervid Benedictines of the closing seventeenth century must have seemed the work of De Rancé in that old Norman abbey. A strange com-

pany of human souls, attracted by the former distinction of the great abbot as well as by the peculiar vows of the institute, must have come together in its silent halls! One hears many stories, in the lighter vein, regarding some of its inmates. Thus, there was a certain furious ex-trooper, lately reeking with blood, it seems, who got himself much commended by living on baked apples, and a young nobleman who devoted himself to the work of washing daily the monastery spittoons. One brother, the story runs, having one day said there was too much salt in his scalding-hot broth, immediately burst into tears of contrition for his wickedness in complaining; and another went for so many years without raising his eyes that he knew not a new chapel had been built, and so quite cracked his skull one day against the wall.

The abbey was an asylum for the poor and helpless, the shipwrecked, the conscience-stricken, and the broken-hearted—for that meditative type of fervid piety which for ages has looked upon the cloister as the true earthly paradise wherein to rear the difficult edifice of the soul's salvation. Much noble blood sought De Rancé's retreat, to wash out, if might be, its terrifying stains; and more than one reckless spirit went thither to take upon itself the yoke of purer, sweeter usages.

De Rancé's work remains an influence in the world. His monastery and his reform constitute the true background of material and spiritual fact against which to outline the

BROTHERS.

A FOLLOWER OF ST. JOSEPH.

present Abbey of La Trappe in Kentucky. Even when thus clearly viewed, it seems placed where it is only by some freak of history. An abbey of La Trappe in Kentucky! How utterly inharmonious with every element of its environment appears this fragment of old French monastic life! It is the twelfth century touching the last of the nineteenth—the Old World reappearing in the New. Here are French faces—here is the French tongue. Here is the identical white cowl presented to blessed St. Alberick in the forests of Burgundy nine hundred years ago. Here is the rule of St. Benedict, patriarch of the Western monks in the sixth century. When one is put out at the wayside station, amidst woodlands and fields of Indian-corn, and, leaving all the world behind him, turns his footsteps across the country towards the abbey more than a mile away, the seclusion of the region, its ineffable quietude, the infinite spiritual isolation of the life passed by the silent brotherhood—all bring vividly before the mind the image of that ancient distant abbey with which this one holds connection so sacred and so close. Is it not the veritable spot in Normandy? Here too is the broad basin of retired country; here are the densely wooded hills, shutting it in from all the world; here the orchards and vineyards and gardens of the ascetic devotees; and as the night falls from the low blurred sky of ashen-gray, and cuts short a silent contemplation of the scene, here too one finds one's self, like some belated traveler in the dangerous forests of old, hurrying on to reach the porter's lodge and ask admission within the sacred walls to enjoy the

hospitality of the venerable abbot. It is interesting to inquire how this religious exotic from another clime and another age ever came to be planted in such a spot.

II.

FOR nearly a century after the death of De Rancé it is known that his followers faithfully maintained his reform at La Trappe. Then the French Revolution drove the Trappists as wanderers into various countries, and the abbey was made a foundry for cannon. A small branch of the order came in 1804 to the United States and established itself for a while in Pennsylvania, but soon turned its eyes towards the greater wilds and solitudes of Kentucky. For this there was sufficient reason. It must be remembered that Kentucky was early a great pioneer of the Catholic Church in the United States. Here the first episcopal see of the West was erected, and Bardstown held spiritual jurisdiction, within certain parallels of latitude, over all States and Territories between the two oceans. Here too were the first Catholic missionaries of the West, except those who were to be found in the French stations along the Wabash and the Mississippi. Indeed, the Catholic population of Kentucky, which was principally descended from the colonists of Lord Baltimore, had begun to enter the State as early as 1775, the nucleus of their settlements soon becoming Nelson County, the locality of the present abbey. Likewise it should be remembered that the Catholic Church in the United States, especially that portion of it in Kentucky, owes a great debt to the zeal of the exiled French clergy of those early days. That buoyancy and elasticity of the French character which naturally adapts it to every circumstance and emergency was then most demanded and most efficacious. From these exiles the infant missions of the State were supplied with their most devoted laborers.

Hither, accordingly, the Trappists removed from Pennsyl-

OFFICE OF THE FATHER PRIOR.

vania, establishing themselves on Pottinger's Creek, near Rohan's Knob, several miles from the present site. But they remained only a few years. The climate of Kentucky was deemed ill suited to their life of unrelaxed asceticism, and, moreover, their restless superior had conceived a desire to Christianize Indian children, and so removed the languishing settlement to Missouri. There is not space for following the solemn march of those austere exiles through the wildernesses of the New World. From Missouri they went to an ancient Indian burying-ground in Illinois and there built up a sort of village in the heart of the prairie; but the great mortality from which they suffered and the subsidence of the fury of the French Revolution recalled them in 1813 to France, to reoccupy the establishments from which they had been banished.

It was of this body that Dickens, in his "American Notes," wrote as follows:

Looming up in the distance, as we rode along, was another of the ancient Indian burial-places, called Monk's Mound, in memory of a body of fanatics of the order of La Trappe, who founded a desolate convent there many years ago, when there were no settlements within a thousand miles, and were all swept off by the pernicious climate; in which lamentable fatality few rational people will suppose, perhaps, that society experienced any very severe deprivation.

But it is almost too late to say that in these "Notes" Dickens was not always either kindly or correct.

This is a better place in which to state a miracle than to discuss it; and the following account of a heavenly portent, which is related to have been vouchsafed the Trappists while sojourning in Kentucky, may be given without comment:

In the year 1808 the moon, being then about two-thirds full, presented a most remarkable appearance. A bright, luminous cross, clearly defined, was seen in the heavens, with its arms intersecting the center of

the moon. On each side two smaller crosses were also distinctly visible, though the portions of them most distant from the moon were more faintly marked. This strange phenomenon continued for several hours and was witnessed by the Trappists on their arising, as usual, at midnight, to sing the Divine praise.

The present monastery, which is called the Abbey of Gethsemane, owes its origin immediately to the Abbey of La Meilleraye, of the department of the Loire-Inférieure, France. The abbot of the latter had concluded arrangements with the French Government to found a house in the island of Martinique on an estate granted by Louis Philippe; but this monarch's rule having been overturned, the plan was abandoned in favor of a colony in the United States. Two fathers, with the view of selecting a site, came to New York in the summer of 1848, and naturally turned their eyes to the Catholic settlements in Kentucky and to the domain of the pioneer Trappists. In the autumn of that year, accordingly, about forty-five "religious" left the mother-abbey of La Meilleraye, set sail from Havre de Grace for New Orleans, went thence by boat to Louisville, and from this point walked to Gethsemane, a distance of some sixty miles. Although scattered among various countries of Europe, the Trappists have but two convents in the United States—this, the oldest, and one near Dubuque, Iowa, a colony from the abbey in Ireland.

BY THE WALL.

III.

THE domain of the abbey comprises some seventeen hundred acres of land, part of which is tillable, while the rest consists of a range of wooded knobs that furnish timber to the monastery steam saw-mill. Around this domain lie the homesteads of Kentucky farmers, who make, alas! indifferent monks. One leaves the public road that winds across the open country and approaches the monastery through a long level avenue, inclosed on each side by a hedge-row of cedars and shaded by nearly a hundred beautiful English elms, all the offspring of a single parent stem. Traversing this dim, sweet spot, where no sound is heard but the waving of boughs and the softened notes of birds, one reaches the porter's lodge, a low brick building, on each side of which extends the high brick wall that separates the inner from the outer world. Passing beneath the archway of the lodge, one discovers a graceful bit of landscape gardening—walks fringed with cedars, elaborately designed beds for flowers, pathways so thickly strewn with sawdust that the heaviest footfall is unheard, a soft turf of green traversed only by the gentle shadows of the pious-looking Benedictine trees: a fit spot for recreation and meditation. It is with a sort of worldly start that you come upon an inclosure at one end of these grounds wherein a populous family of white-cowled rabbits tip around in the most noiseless fashion.

Architecturally there is little to please the æsthetic sense in the monastery building, along the whole front of which these grounds extend. It is a great quadrangular pile of brick, three stories high, heated by furnaces and lighted by gas—modern appliances which heighten the contrast with the ancient life whose needs they subserve. Within the quadrangle is a green inner court, also beautifully laid off. One side of it consists of two

chapels, the one appropriated to the ordinary services of the Church and entered from without the abbey-wall by all who desire; the other, consecrated to the offices of the Trappist order, entered only from within, and accessible exclusively to males. It is here that one finds occasion to remember the Trappist's vow of poverty. The vestments are far from rich, the decorations of the altar far from splen-

WITHIN THE GATES.

did. The crucifixion scene behind the altar consists of wooden figures carved by one of the monks now dead and painted with little art. No tender light of many hues here streams through long windows rich with holy reminiscence and artistic fancy. The church has, albeit, a certain beauty of its own—that charm which is inseparable from fine proportion in stone and from gracefully disposed columns growing into the arches of the lofty roof. But the cold gray of the interior, severe and unrelieved, bespeaks a place where the soul comes to lay itself in simplicity before the Eternal as it would upon a naked, solitary rock of the desert. Elsewhere in the abbey, of course, greater evidences of votive poverty occur—in the various statues and shrines of the Virgin, in the pictures and prints that hang in the main front corridor—in all that appertains to the material life of the community.

Just outside the church, beneath the perpetual benediction of the cross on its spire, is the quiet cemetery garth where the dead are side by side, their graves covered with myrtle, and each having for

THE COOK.

its headstone a plain wooden crucifix bearing the religious name and the station of him who lies below—Father Honorius, Father Timotheus, Brother Hilarius, Brother Eutropius. Who are they? And whence? And by what familiar names were they greeted on the old play-grounds and battle-fields of the world?

The Trappists do not, as it is commonly understood, daily dig a portion of their own

BEFORE THE MADONNA.

graves. When one of them dies and has been buried, a new grave is begun beside the one just filled, as a reminder to all the survivors that one of them must surely take his place therein. So, too, when each seeks the cemetery inclosure, in hours of holy meditation, and, standing bare-headed among the graves, prays softly for the souls of his departed brethren, he may come for a time to this unfinished grave, and, kneeling on the rude board placed at the head, pray Heaven, if he be next, to dismiss his soul in peace.

Nor do they sleep in the dark, abject kennel, which the imagination, in the light of medieval history, constructs as the true monk's cell. By the rule of St. Benedict, they sleep apart but in the same place, and the dormitory is a great upper room, well lighted and clean, in the body of which a general framework several feet high is divided into partitions that look like narrow berths.

It is while going from place to place in the abbey and considering the other buildings connected with it that one grows deeply interested in a subject but little understood—the daily life of the monks.

IV.

WE have all acquired poetical and pictorial conceptions of monks—praying with wan faces and upturned eyes half darkened by the shadowing cowl, the coarse serge falling away from the emaciated neck, the hands pressing the crucifix close to the heart; and along with this type has always been associated a certain idea of cloistral life—that it was an existence of vacancy and idleness, or at best of deep meditation of the soul broken only by express spiritual devotions. There is another kind of monk, of course, with all the marks of which we seem traditionally familiar; the monk with the rubicund face, sleek poll, good epigastric development, and slightly unsteady gait, with whom, in turn, we have connected a different phase of conventual discipline—fat capon and stubble goose, and midnight convivial chantings growing ever more fast and furious, but finally dying away in a heavy stertorous calm. Poetry, art, the drama, the novel, have each portrayed human nature in orders; the saint-like monk, the intellectual monk, the bibulous, the felonious, the fighting monk (who loves not the hermit of Copmanhurst?), until the memory is stored and the imagination preoccupied.

Living for a while in a Trappist monastery in modern America, one gets a pleasant infusion of actual experience, and is disposed to insist upon the existence of other types no less picturesque and on the whole much more acceptable. He finds himself, for one thing, brought face to face with the working monk. Idleness to the Trappist is the enemy of the soul, and one of his vows is manual labor. Whatever a monk's previous station may have been, he must perform, according to abbatial direction, the most menial services. None are exempt from work; there is no place among them for the sluggard. When it is borne in mind that the abbey is a self-dependent institution, where the healthy must be maintained, the sick cared for, the dead buried, the necessity

AMONG THE GRAVES.

for much work becomes manifest. In fact, the occupations are about as various as those of a modern factory. There is scope for intellects of all degrees and talents of well-nigh every order. Daily life, unremittingly from year to year, is an exact system of duties and hours. The building, covering about an acre of ground and penetrated by corridors, must be kept faultlessly clean. There are three kitchens,—one for the guests, one for the community, and one for the infirmary,—that require each a *coquinarius* and separate assistants. There is a tinker's shop and a pharmacy; a saddlery, where the broken gear used in cultivating the monastery lands is mended; a tailor's shop, where the worn garments are patched; a shoemaker's shop, where the coarse, heavy shoes of the monks are made and cobbled; and a barber's shop, where the Trappist beard is shaved twice a month and the Trappist head is monthly shorn.

Outdoors the occupations are even more varied. The community do not till the farm. The greater part of their land is occupied by tenant farmers, and what they reserve for their own use is cultivated by the so-called "family brothers," who, it is due to say, have no families, but live as celibates on the abbey domain, subject to the abbot's authority, without being members of the order. The monks, however, do labor in the ample gardens, orchards, and vineyard from which they derive their sustenance, in the steam saw-mill and grain-mill, in the dairy and the cheese factory. Thus picturesquely engaged one may find them in autumn: monks gathering apples

and making barrel after barrel of pungent cider, which is stored away in the vast cellar as their only beverage except water; monks repairing the shingle roof of a stable; monks feeding the huge swine which they fatten for the board of their carnal guests, or the fluttering multitude of chickens from the eggs and young of which they derive a slender revenue; monks grouped in the garden around a green and purple heap of turnips, to be stored up as a winter relish of no mean distinction.

Amidst such scenes one forgets all else while enjoying the wealth and freshness of artistic effects. What a picture is this young Belgian cheese-maker, his sleeves rolled up above the elbows of his brawny arms, his great pinkish hands buried in the golden curds, the cap of his serge cloak falling back and showing his closely clipped golden-brown hair, blue eyes, and clear delicate skin! Or this Australian ex-farmer, as he stands by the hopper of grist or lays on his shoulder a bag of flour for the coarse brown bread of the monks. Or this

After photograph.

THE FORTNIGHTLY SHAVE.

dark old French opera-singer, who strutted his brief hour on many a European stage, but now hobbles around, all hoary in his cowl and blanched with age, to pick up a handful of garlic. Or this athletic, superbly formed young Irishman, thrusting a great iron prod into the glowing coals of the saw-mill furnace. Or this slender Switzer, your attendant in the refectory, with great keys dangling from his leathern cincture, who stands by with folded hands and bowed head while you are eating the pagān meal he has pre-

pared, and prays that you may be forgiven for enjoying it.

From various countries of the Old World men find their way into the Abbey of Gethsemane, but among them are no Americans. Repeatedly the latter have made the experiment, and have always failed to persevere up to the final consecration of the white cowl. The fairest warning is given to the postulant. He is made to understand the entire extent of the obligation he has assumed; and only after passing through a novitiate, prolonged

at the discretion of the abbot, is he admitted to the vows that must be kept unbroken till death.

v.

FROM the striking material aspects of their daily life, however, one is soon recalled to a sense of their subordination to spiritual aims

and half of cream. The guest-master, whose business it is to act as your guide through the abbey and the grounds, is warily mindful of his special functions and requests you to address none but him. Only the abbot is free to speak when and as his judgment may approve. It is silence, says the Trappist, that shuts out new ideas, worldly topics, controversy. It is

THE REFECTORY.

and pledges; for upon them all, like a spell of enchantment, lies the sacred silence. The honey has been taken from the bees with solemnity; the grapes have been gathered without song and mirth. The vow of life-long silence taken by the Trappist must of course not be construed literally; but after all there are only two occasions during which it is completely set aside—when confessing his sins and when singing the offices of the Church. At all other times his tongue becomes, as far as possible, a superfluous member; he speaks only by permission of his superior, and always simply and to the point. The monk at work with another exchanges with him only the few low, necessary words, and those that provoke no laughter. Of the three so-called monastic graces, *Simplicitas*, *Benignitas*, *Hilaritas*, the last is not his. Even for necessary speech he is taught to substitute a language of signs, as fully systematized as the speech of the deaf and dumb. Should he, while at work, wound his fellow-workman, sorrow may be expressed by striking his breast. A desire to confess is shown by lifting one hand to the mouth and striking the breast with the other. The maker of cheese crosses two fingers at the middle point to let you know that it is made half of milk

and half of cream. The guest-master, whose business it is to act as your guide through the abbey and the grounds, is warily mindful of his special functions and requests you to address none but him. Only the abbot is free to speak when and as his judgment may approve. It is silence, says the Trappist, that shuts out new ideas, worldly topics, controversy. It is

silence that enables the soul to contemplate with singleness and mortification the infinite perfections of the Eternal. In the abbey it is this all-pervasive hush that falls like a leaden pall upon the stranger who has rushed in from the talking universe and this country of free speech. Are these priests modern survivals of the rapt solitaires of India? The days pass, and the world, which seemed in hailing distance to you at first, has receded to dim remoteness. You stand at the window of your room looking out, and hear in the autumn trees only the flute-like note of some migratory bird, passing slowly on towards the south with all its kind. You listen within, and hear but a key turning in distant locks and the slow-retreating footsteps of some dusky figure returning to its lonely self-communings. The utmost precaution is taken to avoid noise; in the dormitory not even your guide will speak to you, but explains by gesture and signs. During the short siesta the Trappists allow themselves, if one of them, not wishing to sleep, gets permission to read in his so-called cell, he must turn the pages of his book inaudibly. In the refectory, while the meal is eaten and the appointed reader in the tribune goes through a service, if one through carelessness

READING IN THE CHAPTER ROOM.

makes a noise by so much as dropping a fork or a spoon, he leaves his seat and prostrates himself on the floor until bidden by the superior to arise. The same penance is undergone in the church by any one who should distract attention with the clasp of his book.

A hard life, to purely human seeming, does the Trappist make for the body. He thinks nothing of it. It is his evil tenement of flesh,

whose humors are an impediment to sanctification, whose propensities are to be kept down by the practice of all austerities. To it in part all his monastic vows are addressed—perpetual and utter poverty, chastity, manual labor, silence, seclusion, penance, obedience. The perfections and glories of his monastic state culminate in the complete abnegation and destruction of animal nature, and in the

AT WORK.

correspondence of his earthly life with the holiness of divine instruction. The war of the Jesuit is with the world; the war of the Trappist is with himself. From his narrow bed, on which are simply a coarse thin mattress, pillow, sheet, and coverlet, he rises at 2 o'clock, on certain days at 1, on others yet at 12. He has not undressed, but has slept in his daily garb, with the cincture around his waist.

This dress consists, if he be a brother, of the roughest dark-brown serge-like stuff, the over-garment of which is a long robe; if a father, of a similar material, but white in color, the over-garment being the cowl, beneath which is the black scapular. He changes it only once in two weeks. The frequent use of the bath, as tending to luxuriousness, is forbidden him, especially if he be young. His diet is vegetables, fruit, honey, cider, cheese, and brown bread. Only when sick or infirm may he take even fish or eggs. His table-service is pewter, plain earthenware, a heavy wooden spoon and fork of his own making, and the bottom of a broken bottle for a salt-cellar. If he wears the white cowl, he eats but one such frugal repast a day during part of the year; if the brown robe, and therefore required to do more work, he has besides this meal an early morning luncheon called "mixt." He renounces all claim to his own person, all right

over his own powers. "I am as wax," he exclaims; "mold me as you will." By the law of his patron saint, if commanded to do things too hard, or even impossible, he must still undertake them.

For the least violations of the rules of his order; for committing a mistake while reciting a psalm, responsory, antiphon, or lesson; for giving out one note instead of another, or saying *dominus* instead of *domino*; for breaking or losing anything, or committing any fault while engaged in any kind of work in kitchen, pantry, bakery, garden, trade, or business — he must humble himself and make public satisfaction forthwith. Nay, more: each by his vows is forced to become his brother's keeper, and to proclaim him publicly in the community chapter for the slightest overt transgression. For charity's sake, however, he may not judge motives nor make vague general charges.

The Trappist does not walk beyond the inclosures except by permission. He must repress all those ineffably tender yearnings that visit and vex the human heart in this life. The death of the nearest kindred is not announced to him. Forgotten by the world, by him it is forgotten. Yet not wholly. When he lays the lashes of the scourge on his flesh — it may be on his carious bones — he does it

not for his own sins alone, but for the sins of the whole world; and in his searching, self-imposed humiliations, there is a silent, broad out-reaching of sympathetic effort in behalf of all his kind. Sorrow may not depict itself freely on his face. If a suffering invalid, he must manifest no interest in the progress of his malady, feel no concern regarding the result. In his last hour, he sees ashes strewn upon the

been the realization of the infinite loveliness and beauty of personal purity; and the saint in the desert was the apotheosis of the spiritual man." However this may be, here at Gethsemane you see one of the severest expressions of its faith that the soul has ever given, either in ancient or in modern times; and you cease to think of these men as members of a religious order, in the study of them as exponents

IN THE SMITHY.

floor in the form of a cross, a thin scattering of straw made over them, and his body extended thereon to die; and from this hard bed of death he knows it will be borne on a bier by his brethren and laid in the grave without coffin or shroud.

VII.

BUT who can judge such a life save him who has lived it? Who can say what undreamt-of spiritual compensations may not come even in this present time as a reward for all bodily austerities? What fine realities may not body themselves forth to the eye of the soul, strained of grossness, steadied from worldly agitation, and taught to gaze year after year into the awfulness and mystery of its own being and deep destiny? "Monasticism," says Mr. Froude, "we believe to have

of a common humanity struggling with the problem of its relation to the Infinite. One would wish to lay hold upon the latent elements of power and truth and beauty in their system which enables them to say with quiet cheerfulness, "We are happy, perfectly happy." To them there is no gloom.

Excepting this ceaseless war between flesh and spirit, the abbey seems a peaceful place. Its relations with the outside world have always been kindly. During the civil war it was undisturbed by the forces of each party. Food and shelter it has never denied even to the poorest, and it asks no compensation, accepting such as the stranger may give. The savor of good deeds extends beyond its walls, and near by is a free school under its control, where for more than a quarter of a century boys of all creeds have been educated.

THE GARDEN.

There comes some late autumnal afternoon when you are to leave the place. With a strange feeling of farewell, you grasp the hands of those whom you have been given the privilege of knowing, and walk slowly out past the meek sacristan, past the noiseless garden, past the porter's lodge and the misplaced rabbits, past the dim avenue of elms, past the great iron gateway, and, walking along the sequestered road until you have reached the summit of a wooded knoll half a mile away, turn and look back. Half a mile! The distance is infinite! The last rays of the sun seem hardly able to reach the pale cross on the spire which anon fades into the sky; and the monastery bell, that sends its mellow tones across the shadowy landscape, is rung from an immemorial past.

It is the hour of the *Compline*, the *Salve*, and the *Angelus*—the last of the seven services that the Trappist holds between 2 o'clock in the morning and this hour of early nightfall. Standing alone in the silent darkness you allow imagination to carry you once more into the church. You sit in one of the galleries and look down upon the stalls of the monks ranged along the walls of the nave. There is no light except the feeble gleam of a single low red cresset that swings ever-burning before the altar. You can just discern a long line of nameless dusky figures creep forth from the deeper gloom and glide noiselessly into their seats. You listen to the *cantus plenus gravitate*—those long, level notes with sorrowful cadences and measured pauses, sung by a full, unflinching chorus of voices, old and young.

It is the song that smote the heart of Bossuet with such sadness in the desert of Normandy two and a half centuries ago.

Anon by some unseen hand two tall candles are lighted on the altar. The singing is hushed. From the ghostly line of white-robed fathers a shadowy figure suddenly moves towards the spot in the middle of the church where the bell-rope hangs, and with slow, weird movements rings the solemn bell until it fills the cold, gray arches with quivering sound. One will not in a lifetime forget the impressiveness

of the scene—the long tapering shadows that stretch out over the dimly lighted, polished floor from this figure silhouetted against the brighter light from the altar beyond; the bowed, moveless forms of the monks in brown almost indiscernible in the gloom; the spectral glamour reflected from the robes of the bowed fathers in white; the ghastly, suffering scene of the Saviour, strangely luminous in the glare of the tall candles. It is the daily climax in the devotions of the Old World monks at Gethsemane.

James Lane Allen.

A MAN'S REPROACH.

WHEN into my life you came
You gave me no promise, yet still
Dare I charge on you the shame
Of a pledge you have failed to fulfil.

Said not each tone of your voice,
Said not each look of your eye,
"Measure my truth at your choice;
No means of proof I deny."

Was it for nothing your glance
Held itself, flame pure, to mine?
Needed there speech to enhance
The strength of its promise divine?

Was there no pledge in that smile,
Dazzling beyond all eclipse?
Only God measures your guile
When you could lie with those lips!

You fail me, in spite of it all,
And smile that no promise you break.
No word you have need to recall;
Your self is the vow you forsake!

Arlo Bates.

HOME CULTURE CLUBS.

I.

FIRST THOUGHT: "THE MASSES."

HERE is perhaps, says Professor Huxley in a recent paper, "no more hopeful sign of progress among us in the last half-century than the steadily increasing devotion which has been and is directed to

measures for promoting physical and moral welfare among the poorer classes." And just before, he says, as to the necessity for such measures, "Natural science and religious enthusiasm rarely go hand in hand, but in this matter their concord is complete."

I do not purpose to write very gravely on this subject. But here is the scientist's verdict, that the proposition to "elevate the masses" is good science; and I quote it to gain, what I particularly covet, the attention of minds that, with or without "religious enthusiasm," need this kind of assurance.

To such especially I purpose simply to tell of a scheme of "elevation," now working well in its second year, kept for a time purposely within narrow limits, but growing, and capable, I believe, of indefinite expansion.

It sprang from certain merely colloquial efforts to point out some very common and rather subtle errors which help to explain why, in so vast a field, human sympathy, large self-sacrifice, and gracious condescensions so often reap the slender harvest they do.

For example, it was admitted that there is much truth in the stern statement that the "masses" we purpose to lift sink to where they are by their own specific gravity; that they lack the buoyancy to float, the intelligence, virtues, aspirations, which are the upholding powers in human life, and that they are where they are because of what they are and what they inwardly lack.

Yet this is only part of the truth, and at best it is not final. People are also, in great part, *what* they are because of *where* they are, their inward lack due much to their outward. Moreover, both what one is and where one is depend much on what and where others are with whose fate one's own is entangled.

It may be just as hard, but it is also just as easy, to keep human merit, as to keep water, from finding its level: with this difference, that human character may have, may acquire,

lose, and regain, elasticity. And so we say, even when one is only equal to the station he fills, that the fact is not final. New influences from without may produce new inner powers and merits, which may not only earn better place for self but may liberate others from conditions unworthy of them, to which his own conditions had undeservedly confined them. Though a sunken ship may be mainly of iron, and might never stir to raise itself, we may go down to it and by driving air in and water out may see it, of its own motion, rise again to noble uses. So with a man.

But in the various groups into which the relations or fortunes of life gather us we are not, each one, a separate ship, but are bound together more like the various parts of one or another ship. And while it is mostly by good or bad management that ships float or sink, yet in every ship that floats are many parts that of themselves would sink, and in every ship that sinks are many parts that but for fastenings or entanglements would float. The chances of fortune and the force of merit are not enough to secure "the greatest happiness of the greatest number"; and without that we cannot get the highest good of any. Even of wrecked ships we save what we can. To fortune and merit must be added the factor of *rescue*, whether we call it salvage or salvation. To leave the unfortunate to fight ill-fortune with only their handicapped merit is to leave them to an unintelligent and merciless natural selection to which we would think it inhuman to leave shipwrecked voyagers, and stupid to leave our cattle. So, then, our failures to "elevate the masses" are not because any and every intervention is a meddling with selective forces already adequate to the best results.

Misguided benevolence has its well-known faults. We know the benevolence that does not "help a man to help himself" is not beneficent. We know that nothing is at its best which puts needless obligations upon the beneficiary. We know that to produce merit is at least as good as to find it; that to augment it is better than merely to reward it; that its best rewards are simple recognition, encouragement, and opportunity; and that even in giving these, all gratuitousness is dangerous; and, especially, that there are great risks in all sudden abundance. Benevolence has learned that even in social science there is room and need for sentiment, but that sen-

timent must follow and obey reason, not lead and rule it. All these things we know by heart, and yet our failures go on.

Some say that charity has still too much sentiment. But in fact it has not yet enough. Some say that it has taken on too much science. But really it has not enough. There ought to be no lack of sentiment in the word science. Yet many regard science as something that complicates simple things, whereas it simplifies complex things. If science deals with complex things, so does every other province of human life; but our mental indolence loosely treats complexities as though they were simple, and science as the breeder of complexities. Human benevolence still needs a more scientific thoughtfulness to see the complexity of things too often thus far treated as simple, and a greater depth of sentiment to remember it. Our efforts are still crude.

II.

NOT THE MASS: THE INDIVIDUAL.

WE shall never have any great success in "elevating the mass" until we get beyond treating it merely as a mass. Even political science, impersonal as it is, never secures a safe self-government till it recognizes the individual citizen and his rights. But in the "elevation of the mass" a treatment is required that must go much further from mass-treatment than the true functions of the state will allow it to go. General legislation must not know one man from another; and administrative government may distinguish only between those who break, and those who keep, the law. Individual conditions and relations it recognizes; but individuals it cannot justly consider save impersonally and merely as units of the community. It is only when by crime or infirmity one is disqualified as a simple civil unit that government, not by benevolent choice, but for the protection of society at large, enters into personal considerations with him, in order that by disciplinary or sanitary treatment adjusted to his peculiar, personal, inward needs he may as soon as possible be restored to the precious liberty of impersonal citizenship. We can neither ask nor allow civil government to go further. But something must go further. Something must take personal knowledge of those whose inward and outward conditions may be bettered to the advantage of all, and yet who are not in those plights that alone should make them wards of the state. What will do it?

Commerce, trade, all the material industries, have to do with masses as masses, and with individuals both impersonally and personally. Sometimes not merely the personal capacities

but even the social qualities of the individual must be taken account of in these provinces of life, and so we see the commercial and the social realms overlapping and in no small degree dominating each other, man making the not always noble discovery that commercial ties have their social, and social ties their commercial, values; with this severe limitation, however, that personal relations, qualities, or wants cannot be set up by or for any one as actual commercial claims save for their actual commercial values.

So, then, we cannot intrust to government nor demand of commerce the exercise of personal benevolence. In commerce we have, and must have, limited only by moral law and the laws of the land, the supreme rule of commercial selection, to which all personal considerations must remain subordinate. A far-sighted commercial selection may see commercial values, qualified by personal considerations, far out to right and left of its trodden path, and the most we can rightly demand of commerce is that it follow those values as far as they reach. Both government, and commerce with virtually all her kindred industries, are incalculably beneficent. Without them how should we "elevate the masses"? Yet they are not enough. We may conceive of government or commerce springing from the most benevolent motives, but even so, government may not rightly go beyond the most obvious common welfare; and commerce and her kin, the moment they step beyond the circle of gain, loss, and rectitude, cease to be themselves.

We turn to society. Will it supply the deficiency? Let us first be sure what we mean. A nation is a social group. So are three friends at a fireside. But public society (if I may presume to quote a sentence or two of my own lately printed) comprises one group of relations, and private society entirely another, and it is simply and only evil to confuse the two. Public society, civil society, comprises all those relations that are impersonal, unselective, and in which all men, of whatever personal inequality, should stand equal. Private society is its antipode. It is personal, selective, assortive; ignores civil equality, and forms itself entirely upon mutual preferences and affinities. Our civil social status has of right no special value in private society, and our private social status has of right no special value in our civil social relations. We make the distinction here in order to set aside the idea of public society: we mean, now, private society. Government can make among men only a civil selection, commerce only a commercial selection; but in society we find at last the operations of a personal selection.

III.

THE INDIVIDUAL AND SOCIETY.

AT first glance we who are unlearned on the great deep of social science might suppose that a perfectly normal social movement ought to work the results we are seeking. Why not? Has one not liberty to choose his social companions as he will? If he will but put away all foolish prides,—pride of place, of purse, of blood, of mind, and that worst pride of all, the pride of morals,—may he not bring himself into benevolent and beneficent personal intercourse with whom he will?

No. We presently find that we are overrating our liberty and our power over certain laws that lie in the very nature of private social relations. What makes the social circle? As the key-note of commerce is gain, so that of society is pleasure. As a normal commerce requires that gains be mutual and approximately equal, society requires that pleasures be the same. Sociality is normally and rightly only a sort of commerce, a social exchange, from which we find we must withdraw as soon as we realize our inability to render a *quid pro quo* of social values. Normally it ignores material values, and is totally uncommercial. Yet we discover that though its movements, too, are immensely beneficent, neither can it, with any good effect, let benevolent intentions sharply oppose themselves to the natural operations of social selection.

The merely formative state of a large part of society in America accounts for some broad and frequent errors made by us as to the true province and limits of private sociality. In one great belt of our country there is the strangest confusion of thought as to where public social relations, over which the individual has no private right of control, and private social relations, over which the public voice has no right of control, touch and bound each other; while in another belt there is almost equal confusion as to what private society might do for public society if it would. But wherever in the world we see population dense enough for private society to be selective, we find it broken into countless small groups, "circles," each of which, however they may overlap one another, owes its continuance to the ability of its members to supply mutual entertainment. This ability lacking, no amount of benevolence can hold them, socially, together.

Benevolence, self-sacrifice, condescension, become repellant forces in the social circle wherever they cannot be paid for in kind. Social selection does not spare even the family circle, but draws its various members apart from one another frequently, and at length permanently. As the century-plant constantly

disintegrates and absorbs its old leaves and of their substance sends out new, society divides and absorbs the old family circle and sends out the germs of more numerous new ones. Not in a mean sense only, but in a very noble way private society is a mart. In commerce and the industries the prime necessity laid by each upon himself is that he get for all he gives. In society he requires of himself to give for all he gets. In the commercial exchange the man without commercial resources is intolerable. In the social exchange the man without social resources equal to its demands is not nearly so intolerable to it as it is to him,—not only because its condescensions put debts upon him that he feels he cannot pay, but also because the social circle that does not prize his social resources has probably few or none to offer that he wants.

What fattens the ox would starve the fox;
Yet the fox has food that would starve the ox.

That is to say, no one is wholly without social resources, only let those resources find their right social market by a rational social selection.

Now, if social selection were always rational, we should see it reaching out generously across the lines of life and the accidents of fortune, and selecting, rejecting, and assorting men and women according to their abilities to make fairly even exchange with one another of social pleasures and such intellectual and spiritual enlargements, small or great, as these pleasures may yield. But other forces enter and make confusion. Family ties, parental and fraternal affection and pride, hold out more or less stubbornly for the social equality of all the family's members, often in the face of gross inequalities. On the other hand, society often crudely assesses the individual socially by the accidents of family relationship, and counts him far above or below his own true value. Commercial, political, and other outside values intrude themselves, and seek and make all degrees of false appraisements above and below the just mark. Then there is our proneness to prize superficial graces and conventional forms more than inner merit. And there, too, are the spirit of mere caste, and the often still narrower one of coterie; and again our selfish fear of making unlucky selections, and the greater ease of keeping the strait and narrow way of social orthodoxy; these all mar the proper workings of social distribution.

Hence we find no plane of private society, however exalted, where we may not encounter the boor, the fool, and the knave, holding or held in their unearned station on false claims; and none, however humble, where we may not meet the wise, the good, the gentle, over-

looked by the social groups into which their merits ought to bring them, and themselves and the world robbed of their best values by accidental conditions that might easily be removed.

IV.

SOCIAL SELECTION KILLED AND STUFFED.

SOCIAL selection being thus wild and erratic, we naturally utter much fine indignation against it and demand repair of the evil wrought. Our benevolent sentiment hurries forward to ask why, since the comfortable ranks of society have not kept up an intelligent and faithful discrimination, but let their processes of selection be more or less warped by all manner of ignoble motives, why should they hold themselves aloof from and above less fortunate humanity, to its estrangement, embitterment, and degradation? And then we set about to mend the wrong by methods that too often only add to the confusion.

We feel that a moral duty has been neglected and must now be performed. We join hands with others who propose to correct the same evils because, for their part, they see in them a menace to the order and safety of public society; and with yet others, distinctively "religionists," who see religion dammed up, making progress and gathering numbers only in the ranks of comfortable respectability, and irreligion, vulgarity, and bad morals widening like a flood and threatening every guard that the God-fearing can throw around their own children. And so we join to "elevate the masses."

With what result? To find out speedily, with mortification and resentment, that the sorts of people we attempt to elevate either openly spurn or secretly despise any such attempts made in order to satisfy our sense of duty, or to subserve the public interest, or to promote the cause and fortunes of religion. They will not be used either to wipe our conscience clear, or to abate a public nuisance, or as a filling even for churches and church statistics. We recoil from the effort, bruised and sore.

Then when our benevolence and pride have recovered from their wounds, we try another plan: we offer them personal friendship. We see this is what we owe them, and that the real or suspected absence of this is what they resent. Now, friendship implies fellowship; and we lightly assume, contrary to our best knowledge, that friendship means private social companionship, and offer them personal friendship in this form. And ninety-nine times in a hundred they decline this also.

The trouble is, of course, not in the friendship; it is in the form the friendship takes.

And the difficulty stands, whether the form be genuine or specious. If genuine, the form will consist in the one to be helped, as well as the helper, generously putting away all false pride and unworthy suspicions, and each receiving from the other at least one social visit under his or her own roof. Most likely one such exchange will show that neither is able to offer a social companionship that is not an unprofitable weariness to the other. If the effort drags on, how it drags!

If only there were pain to relieve or sorrow to comfort, what new life the forced relation would at once display! "In sooth," says the young prince to Hubert, "I would you were a little sick, that I might sit all night and watch with you." Actual, present distress makes fellowships, while it lasts, that cannot be made without it. But in such a case the visit is one of mercy, not of sociality, whereas we are seeking a scheme that will not have to wait for people to fall into pitiful distress or languish when the distress is gone. Sociality cannot be other than a burden, with its weight resting most heavily on the one who was to be helped by it, unless it has its own natural, inherent reasons for being.

To condescend and manage socially is not so hard; to be socially condescended to and managed — that is what cannot last. Such deformed social fellowship soon and rightly goes and hangs itself. The most that such effort can ever do is by rare chance to find some one out of his true social sphere and bring him into it. It can never have any appreciable effect to fit for any sort of true promotion any one who is unfit. In the vast majority of such cases prompt failure puts the friend and the befriended only further apart, and makes the betterment of the lowly seem more nearly impossible than it ever seemed before.

But generally the offers of friendship from the fortunate to those less so are less genuine even than this. We are in haste for results, choose easy methods rather than thorough ones, and have among us many who only half want and half do not want the results that for one reason or another they join with us to get. Hence specious offers of social attention such as we could not be guilty of making to those who are already on our own social plane; proposals to gather our beneficiaries together and meet them *numerously* without having met or tried to meet them individually; ignoring the fact that there are broad social divergencies among *them* — ranks and circles, as there should be, and the spirits of class and coterie, as there ought not to be; extending social attentions that might at least be genuine if offered personally and in our own drawing or sitting rooms, but are only flimsy counterfeits when

tendered promiscuously and in some public or semi-public place, some society's rooms, or church parlors, or other social neutral ground. What wonder, if those to whom we so condescend turn away saying, "You may mean well, but we don't shake hands with anybody's forefinger."

Another trouble: in this sort of lump treatment there is often as little discrimination concerning who shall make these tenders of sociality as concerning who shall receive them. Fortune and station decide, and an indiscriminate that would insure failure to any private enterprise characterizes an effort which really demands the most careful selection of persons for their wisdom, tact, and social experience. Instead, we see the young, the giddy, the old, the stupid, the self-seeking, and the worldly thrown together, and social selections, eliminations, and separations reasserting themselves on the spot; unless—as is more likely—the intended beneficiaries are wholly absent.

Such schemes, so far from "elevating the masses," only estrange and offend them with no end of unfair conditions, and delude the benevolent with the notion that they are doing their best to effect what they are really doing their best to prevent. Only in the pure democracy and unassorted meagerness of numbers of, for instance, a New England farm-village, where there is no distinct "mass" to elevate, can such schemes be apparently harmless. Even there they are not really so; for at any time the establishment of manufacturing or large commercial interests may develop class and mass, and both sides be found handicapped with false notions of how true friendship is to make itself effective between them. Or if no such material development take place, then those who go out into the larger world seeking better fortune, and find the conditions of class and mass, carry with them the most mischievous misconceptions of what private society can and ought to do for the masses, by virtue of their commercial, church, and other relations, and how it should be done.

Here, then, are certainly two truths: (1) That the masses cannot be elevated by mere mass treatment, and (2) that—be it mass treatment or personal treatment—mere sociality would be quite inadequate even if practicable, and quite impracticable even if adequate.

V.

CLASS TREATMENT, THEN?

ALL mass treatment belongs rightly to legislation and government. The "mass," as a mass, has no wants except its *rights*. To presume to accord these by any sort of private

condescension is extremely offensive to countless minds that may not be able to define why it is so. Yet naturally one will find himself largely disqualified for any salutary treatment of the lowly if he is known to be opposed to any clear right of the mass.

There is a kind of benevolent effort midway between mass treatment and personal treatment. In nations where arbitrary class distinctions are made and sustained by law, even private efforts at the elevation of others may have a limited effectiveness though made in the guise of *class* treatment.

Yet even where society is thus broken up into classes recognized by law and ancient custom, class wants are class rights. Only law can properly supply them. A want which legislation cannot lawfully supply is clearly not a class want, and private effort to supply it ought not to take the form of class treatment; that is, it should not be offered to people in and by and as classes.

Now, in our own country the idea of classes differing from one another in their rights is intolerable to the very ground principles of the nation's structure. No one who is not helpless or criminal belongs to a class. Every one belongs to the whole people, the whole people to him, and he, first and last, to himself. No American principle is better known or more dearly prized by every American in humble life. Occupations, religious creeds, accidents of birth and fortune, may have their inevitable classifying effect; but no one relation of life has any power arbitrarily to determine one's class in any other relation, and any treatment, whether by intention or oversight, of persons whom any accident of life has grouped together, as being all of a sort, is sure to be, and ought to be, resented as at least a blunder. In any private effort, then, to "elevate the masses," in this country at least, class treatment is out of the question.

Very exact persons may say that the support of public education and public charities by public taxation supplies class wants that cannot truly be called class rights. But in fact these benefactions are supported by public tax not because they are charities to classes, but because they are provisions for the common public peace, safety, and welfare. Though the needs they supply are wants of class, they are defensive rights of the whole public, and as such are properly met by public treatment. Even foundlings given into the arms of private charity are so assigned, not for class treatment, but to reduce their class treatment to the extreme practicable minimum and give them the most that can be given of personal consideration. Now, if individual treatment be best for those whom dependency or delin-

quency has classified, how much more is it imperative for those who rightly refuse to be impersonally classed at all and need rather to unlearn their own inconsistent, numerous, rude, and unjust classifications of one another.

VI.

PRIVATE PERSONAL PROFIT AND PLEASURE.

THUS we drop into our true limitations. Private effort for the elevation of the non-dependent and the non-delinquent lowly is right and highly necessary. But it must be for each helped one's own sake, and not merely for the promotion of some good cause or abatement of some general evil.

Not even for the advancement of Christianity? No! If the great fraternity of man will seek each other's best advancement, Christianity will advance itself never so fast. No mass treatment, no class treatment, no *cause* treatment. It must be individual, personal treatment. It is not the mass, the class, or the cause, it is the individual, that we must elevate. Hence you—I—must know the individual. I must learn four things about him—his capabilities, his needs, his desires, and his surroundings. There is one thing I must give him—true friendship; and one thing I must get of him—his confidence; and two that I must exchange with him—profit and pleasure.

Not pleasure alone, for I cannot long give him, or he give me, as much mere pleasure as he can get without me. Yet not profit alone; for most likely uncommercial profit without pleasure is in his eye not worth its effort. Nor yet mere profit and pleasure separately, side by side, or in alternation; but profit yielding pleasure. A profit he may not as easily get without me, and a pleasure not sought for its own sake, but dependent on the profit. And the profit not merely given, but exchanged. For to know that the profit is mutual makes the pleasure mutual, heightens it, and so animates and sustains the relation; while, also, to require mutual profit restrains each side from reaching out farther across social lines than is good for the best results.

So, the first step with him whom I would elevate is to seek a speaking acquaintance with him. This must be got; but in getting it I shall, if I am wise, keep every good social rule that I need not break. Then, not with rash haste, yet promptly, and on the first personal contact, I would set about to discover what he would like to get that I can give, with only gain to him and no apparent loss to me. Even within this limit he may not wish for what I most wish to give him. But I must begin with what he wants—so it be

good—to bring him to what I wish him to want.

Unless he is in some dire distress I must lay no sudden or heavy burden of debt or effort upon him. I must be even more careful to keep the obligation small than to make the benefaction large. My aim must be to produce the most comfortable maximum of beneficence from the most comfortable minimum of benevolence. I must offer no benefit for nothing for which he can in any way pay something. He will like this the better, or if, gently and silently, I have to teach him to like this the better, that is one of the greatest benefits I can do him. Unearned benefits are doubtful benefits; earned benefits live and grow. Yet they need not always be paid for. The child in school must earn every line of his education by study; some one else, perhaps the state, pays for it, and ultimately he repays the state.

So I make nothing gratuitous that can, without discouragement, be made otherwise; and even what is a mere gratuity from me may be no mere gratuity to him. I give him no gratuitous elevation nor even any gratuitous social promotion; but only the opportunity, stimulation, and guidance which he is not able, or perhaps does not yet prize enough, to pay for. Now, plainly, under these limitations, the only elements of true elevation and enlargement that I can enable him to get by earning and yet without paying for them are the various sorts of education and culture of hand, head, and heart.

VII.

CULTURE.

EVEN here we are narrowly hedged in. I have little leisure; he has less. I am tired; he is more so. He is probably not a struggling genius, hungering and thirsting for mental food and drink. He has not the confident hope, the strong ambition, the natural bent, the habit, nor yet, perhaps, the physical stamina, that sustain a man in hard study after eight, nine, ten hours of hard or confining work. It is those who are not equal to this who need help most.

Whatever he and I are going to undertake, its burden must be light. It must be of his choosing, in kind and quantity, and yet of a kind that I can help him with, and in quantity so moderate that it might very comfortably to either of us be more. Again, it must not lay any large tax upon hours of relaxation. Yet must neither quantity nor frequency be so scant as to attenuate the sense of profit and the interest in the pursuit.

But the tax of regularity and punctuality

must be levied and paid. We must meet each other on a regularly recurring day—and no other recurrence is so good as the weekly return—with a fixed and closely observed hour for meeting, and another, just as strictly kept, for separating. And, lastly, the pursuit must be such that I, too, shall visibly gain some pleasure and profit from it; for reasons already given, and also because thus it will gain more value in his esteem, and because thus, too, may I induce others the more numerous to follow my example.

And now are we ready to begin? We have provided unburdensome, inexpensive, pleasurable, and elevating profit. Thus I am offering tangible friendship, inviting confidence, and putting myself in a way to learn his capabilities, needs, desires, and—stop! I have not provided for knowing his habitual surroundings. Until I know them I cannot really know him. How shall I learn what they are and learn it as soon as possible? Manifestly, by observing him in them. But I must not dream of secretly spying into them, nor of indirectly inquiring into them, nor yet of openly and formally investigating or reconnoitering them. There is a wiser, kindlier, friendlier, and far more effective way. It is to hold our weekly meetings in his house.

VIII.

HOME CULTURE.

WE must meet in his home. But will not that seem to him like holding him at arms-length? Will it not tax his confidence to see that I do not ask him to my house? It might. So we had better alternate; one week at his house, the next at mine, the third at his, and so on. But first at his. His courage might fail him to come first to me; mine need not fail to go first to him.

Suppose that, after the first, he should want all our meetings to be at my house. That would be good, but not best. Besides my need to know his habitual surroundings, there are two other strong reasons why I should meet him under his own roof: first, to keep *the home* in his world; and, secondly, to bring some little of *my world* into his home.

Book-learning and the like are but a scant third of education and culture. Our home contacts are a full third, and our world contacts another third. Therefore, to get the best results in culture from him whom I purpose to elevate, I must keep these three channels open. To try to lift him only, and not his home, would be for me to pull one way while his home pulls another way. If I succeed in lifting him, and he still holds on to his home as he should, then the lift is a dead

lift, and either a great strain or a poor result. And if, as I lift him, I loosen the hold between him and his home, it is a hazardous benefit that estranges him from his family circle. For the hearth-stone is the key-stone of all the world's best order and happiness. The easiest, best, quickest way to lift almost any one is to lift him, house, and all.

Moreover, so many other things—the gas-lit street, the theater, the public dance, the club, the saloon, the reading-room, so many things, good, bad, and indifferent—tend to rob the lowly home of its brightest ornaments, that it behooves me to work the other way. Those who must stay at the fireside, the aged and the little ones, have some rights. They may lack the time, the wits, or the wish, to come formally under my care; and yet they may get large benefit,—stimulations, aspirations,—though it be only by virtue of the new outside “atmosphere,” the mere odor of better things, that I unconsciously bring with me when I come thus somewhat within their own home circle: not with mere condescension, but on a definite business with one of its number, mayhap the pride of the flock; a business, too, which they shall see that I myself rightly enjoy. It is far best, for him and for all, that the culture I bring to my one beneficiary be given and received in the home. The more any sort of true culture is shared the more there is for each and every one, especially when it is shared with those we love and who love us. Hence “*home culture*.”

But there is still unprovided the third medium of culture; to wit, healthful contact with the outlying world. It is true, he whom I seek to help will often meet me in my own home. But this will give him but a slight contact with my world, for several reasons. First, we meet to pursue an appointed task which will take up the whole time of our meeting. And then, even if there were time to bring him socially into the company of my intimates, he is, most likely, not equipped for that kind of contact, even with me; and much less with them, he alone and they in the plural. He would shun its repetition, and we should soon be driven apart. Again, himself is not his whole self; his domestic ties are a large part of him. And so, as well for his own sake as for his home's own sake, his home must get this outer contact. My visits bring a little, but not as much as is good. How may more be brought?

I see we must avoid mere sociality here also, and anything likely to run into it. I see, too, that, very rightly, the sense of disadvantage is so plainly with my beneficiary and his household that I must all the time do all I can to make him, as nearly as I can, master

of the situation. Under his roof the only larger contact with the world without that he will like will be with that part already nearest to him in taste and culture. I must let him choose the persons.

Even then he will not like, nor would it be best, for them to be mere lookers-on. They must join us in our task. Hence they must be always the same persons, and their homes also must be open to the weekly meetings of the group, in regular routine. By these provisions we shall largely guard against any estrangements of any humble household from the friends and neighbors of its own sort, make the movement seem less mine than the group's own — their self-provision rather than my benefaction, and ward off especially that rude, envious, or frivolous criticism of unsympathetic daily associates which always puts so heavy a strain upon the moral courage of the uncultured. Other good effects will suggest themselves, without mention here.

Working thus in group we shall have other provisions to make, but we can make them. Different members of the group may show varying degrees of energy for the pursuit of the matter we take up. In that case, for those to whom a single weekly hour of reading is not enough we can supply additional *collateral* reading (or other sources of information, but generally books), on the same subject as that in hand at the group's sessions. This collateral work, apart from the sessions of the group, such members can pursue as they may find it convenient, in their own privacy, and so sustain and enliven their interest and continue to prize their own attendance at the regular meetings.

Under this group arrangement the house of each member will receive our visitation much less often than if we were but two persons; but when it comes it will be a more stimulating event. And my own usefulness will thus be brought to its best; for what I can impart to one at a time I may just as well impart to four or six at once.

Four or six; hardly more. More might embarrass some households even to seat them. It would make the visits of the group at the house of each member too infrequent for best effect, and would diminish that mutual personal acquaintanceship and influence which is the thing most needed for the results we seek. Yet the number need never be arbitrary. There may be this reason or that why some member will be really unable to receive the group at his domicile. He may live, for instance, in an inhospitable boarding-house. Yet should he, least of all, be excluded from the group. Two or more members may belong to one household, and one visitation

count each time in their case for two. Let us say then that four or six should be about the number of homes represented by the total membership, whatever that number may be. On the other hand, if even so few as four or five members are hard to find, there is no reason why a beginning may not be made with two or three. Yet we must be watchful to add others whenever we can. To put all in two words, we must have and keep the group, and we must keep it small. Hence not mere self-culture, but home-culture; and not the home culture society or association, but each time, however often repeated, a home culture club.

IX.

HOME CULTURE CLUBS.

NEVERTHELESS we find ample room for larger aggregations also. If one group of four or five persons under, or rather around, a leader can make a home culture club, the chance is that three or five or ten clubs may be formed within reach of one another. In such a case great stimulation may come to each club through knowledge of what the other clubs are doing, and a friendly comparison of one another's methods, mistakes, and successes.

RECORD OF HOME CULTURE CLUBS.

WEEK ENDING SATURDAY, APRIL 21, 1888. *Numbers of Clubs, with Titles of Books Read.*

- No. 1... Read in meeting: Not to Ourselves, 70 pages. Read out of meeting: Ben Hur, miscellaneous; 40, 150 pages.
- " 2... Read in meeting: L'Univers Illustré, one column.
- " 3... Read in meeting: Pen Pictures of Modern Authors, 26 pages. Read out of meeting: Shandon Bells, Yolande, George Eliot, miscellaneous; 50, 270, 302, 150 pages.
- " 4... Read out of meeting: Personal Memoirs of U. S. Grant, Triumphant Democracy, miscellaneous; 150, 75, 200 pages.
- " 5... Read in meeting: The Sunset Land, 30 pages. Also discussed the question: Is it ever Justifiable to Tell a Lie? Read out of meeting: The Fair God, His One Fault, The Sunset Land; 200, 150, 612 pages.
- " 6... Business meeting. Read out of meeting: Life of Longfellow, miscellaneous; 100, 330 pages.
- " 7... No meeting, on account of illness of members.
- " 8... Read in meeting: The Twenty-ninth of February, 36 pages. Read out of meeting: Humboldt's Travels, Theodolf the Icelander, Life of Hegel, Hegel's Lectures on Philosophy of History, Life of Humboldt, Life of Fichte, Undine; 428, 638, 300, 250, 325, 191 pages.
- " 9... Read in meeting: What Social Classes Owe to Each Other, 50 pages. Read out of meeting: Queen Money, Yoke of the Thora, Caleb Field, Hawthorne's Tales, Tolstoi's Stories, miscellaneous; 500, 250, 100, 136, 200 pages.
- " 10... Read in meeting: Longfellow's Life and Poems, 25 pages. Read out of meeting: German Literature, Christian Science, Longfellow, United States History, Assyria, miscellaneous; 300, 225, 500, 300, 424 pages.
- " 11... Read in meeting: Harold, the Last of the Saxon Kings, 30 pages. Read out of meeting: Universal History, Feudal England; 20, 15 pages.
- " 12... Read in meeting: United States History, 12 pages. Read out of meeting: Girls who became Famous Women, 193 pages.
- " 13... Read in meeting: Boy Travelers in Russia, 43 pages. Read out of meeting: Our Boys of India, Uncle Tom's Cabin; 320, 65 pages.
- " 14... Read in meeting: Pickwick Papers, 50 pages. Read out of meeting: Through Storm to Sunshine, From Hand to Mouth, Vice Versa, Under the Shield, Romance of the Republic, Some Other Folks of Woodstock, Gold of Chickoree, miscellaneous; 1592, 914, 836 pages.
- " 15... Read out of meeting: History of California, History of Our Own Times, magazines; 200, 175, 150, 75 pages.
- " 16... Read in meeting: Soldier and Servant, 43 pages. Read out of meeting: History of England, History of the World, miscellaneous; 1000, 115, 500 pages.
- " 17... Read in meeting: Faust, 47 pages. Read out of meeting: Trumps, Don Quixote, Juan and Juanita, Les Misérables, The Fair God, Peveril of the Peak; 392, 234, 98, 236, 176, 210 pages.
- " 18... No meeting. Read out of meeting: Sweet Cicely, miscellaneous; 120, 80 pages.
- " 19... PARKVILLE, MO.—No report received this week.
- " 20... BALTIMORE, MD.—No report received this week.

[Here follows a tabulated summary.]

Even merely to convene at occasional intervals in a common gathering of all the clubs, not in private sociality, but either as an audience to some elevating public entertainment, or for each club to make its own report, and hear the aggregated report, of work done; nay, even the mere sight of their own numbers will kindle enthusiasm, inspiration, *esprit de corps*, public esteem, and new energy and effort.

Hence the plural, the home culture clubs, with their secretary—one for all—receiving weekly from every club a postal-card report of its own work done,—as far as mere figures can tell it,—and sending weekly to every club an engrossed record of the whole work of the previous week in all the clubs, as gathered from these postal-cards. Hence, too, the general meetings of all the clubs together, as often as once in every six or eight weeks.

And these general meetings may be given another value—they may provoke the formation of new clubs. To this end invitations to be present may be given numerously to those of

whom it is most desirable to see the clubs made up; and probably both the best and the readiest way to insure this is to allow every member, leaders and all, the right to give the same appointed number of invitations to persons of his choice not yet in any home culture club.

HERE, then, seems to be a complete scheme for the continuous, safe, true befriending of the less fortunate by the moderately more fortunate, applicable to all sorts and conditions of life that do not justify the deprivation or surrender of personal liberty. It appears to be free from the flaws and drawbacks that depreciate so many generous efforts to reach across the gross inequalities of fortune and rank and establish a mutually elevating human fraternity without risk of mischievous social confusion. It offers no gratuitous promotion of any sort, nor even any enervating opportunity; but only opportunity of the stimulating sort, opportunity to earn and achieve true elevation. It purposes to elevate the individual not out from

the home circle, but in it, and, as much as may be, by the participation of the home circle itself in that elevation. It purposes, under the best safeguards, to bring those who may be severed from family ties into contact with family circles, as nearly as may be of their own best affinity. It does not purpose to put any one in any burdensome degree under another's condescension, nor does it call upon any one for tasks wholly unprofitable to self. It involves no chance of unwisely sudden changes in any one's condition. It purposes to be practicable for as few as two or three persons, or for as many thousands; to be good and profitable as far as it goes, little or much, whether in effort, duration, or numbers, and to involve no possible loss in case of possible failure. In any community where books may be borrowed from private hands or public library the expense involved may be made so slight as not to require the question of ways and means to be broached beyond the circle of a very few friends in sympathy with any such work.

X.

WILL THEY WORK ?

Two questions remain to be met: First, would this scheme, put into practice, be effective? But the scheme has been tried. It is working. As in the nature of all things, particular clubs will have, are having, their birth, life, and death, and while they live one will differ from another in effectiveness; but the plan works and the work is growing.

The experiment has been cautiously made. Each step has been studied both before and after it was taken, before another has been proposed. Proposals to start clubs in many towns far apart from one another have been held in suspense, and the venture until very lately has been intentionally and entirely confined to one place, the town of Northampton, Massachusetts. Here there have been started one by one, from time to time during the year 1887 and the winter and spring of 1888, twenty home culture clubs. Eighteen still exist, and the only two that have disbanded have done so by reason of changes beyond control, and not for lack of interest or from any discovered fault in the scheme. Many thousands of pages of standard literature have been read and heard around the evening lamp, or in "collateral readings," by those with whom reading had been no habit. Two other clubs have lately been admitted, though meeting in distant towns. The total membership is at present one hundred and forty-four, and the aggregate number of pages read weekly averages about eighteen thousand. But it is recognized that an arithmetical count is but a

crude way of indicating the work done, only justified by the absence of any other simple method. Many pages have been not merely read, but studied, recounted, debated. All ranks of society are represented, with those who move in the plainer walks of life distinctly in the majority, and it is believed that the members are being brought into a helpful contact with others from more or less fortunate and refined planes than their own, and are getting that knowledge of and proper regard for one another and one another's widely divergent social conditions which every true interest of society must commend.

And the second question: What errors or abuses is the scheme in danger of? One, undoubtedly, is fashion. In view of this the greatest pains have been taken to avoid enlisting any sudden enthusiasm, or appealing, in the fortunate ranks of society, to the sorts of persons likely to be attracted by mere novelty or vogue. However, should the system anywhere, at any time, so rise into the favor of people of leisure as to become fashionable, and thus tempt light-minded persons of fortune to take it up for their own mere diversion, it will meet the failure it will merit; but the failure need not extend much beyond the time and place of such misuse.

Another abuse to be guarded against is letting the work degenerate into class treatment. We need not expand the thought again. Class treatment, in this country at least, will merely fail to reach the classes reached after.

The one great danger is the error of private sociality. It may work in two ways: persons may form clubs of really diverse social elements,—which will be proper,—but in an indiscreet and impatient goodness of heart undertake to build up a mutual friendship and acquaintanceship by socialities, or let clubs idly drift into them. This would be bad, and only bad, whether for the club itself or as a precedent. For the consequent social confusion would either break up the club or alienate more or less of its members, and leave the remainder a petty social clique getting no good across the ordinary social lines. Or persons may form a club or clubs with members drawn all from one social rank, either in humbler or in higher life. In such a case they may find much profit; but the foremost object of the whole scheme would thus be overlooked from the very start, and a new force added to confirm, where the design should be to offset, the crude assortments made by uncertain fortune and the caprices of private social selection.

To start these clubs anywhere requires no outlay nor any wide coöperation. Wherever any man or woman of the most ordinary attainments can gather two, three, or four others,

in any sort or degree less accomplished, a club may be formed, and if necessary can be complete in itself; or it may join itself by correspondence to some group of clubs elsewhere, and have the benefit of making weekly reports and getting weekly the aggregated record of the whole group of clubs. Wherever there is such a group of clubs there should be a president and a secretary, and it will probably always be for the best that the secretary receive some small quarterly or semi-yearly compensation in consideration of a business-like attention to his or her duties. An unpaid secretaryship is probably too old a snare to need warning against here.

The home culture clubs are not recommended for filling churches, emptying charitable institutions, or eradicating any great visible public evil, but as means for proving practically our love and care for our less fortunate brother or sister. If the scheme, when time and diverse regions have fairly tried it, wins our needy fellow-man's confidence and

kindles his higher desires; if it helps us to correct somewhat the misfortunes of others and to make human fraternity something wider than mere social affinity will, or social assortment ought to, stretch, it will live; if not, it will drag no one with it into the grave.

The home culture clubs are recommended not to zealots only, but to those generous thousands who have seen the poor success of so many efforts to commend the Christianity of the fortunate to the hearts of the unfortunate, and have seen the cause of failure in the neglect to secure personal acquaintance and to carry unprofessional friendly offices into the home, free from the burden of charity on the one hand and of sociality on the other. The plan is submitted to all who believe that to help a lowlier brother to supply any worthy craving of the mind that he may already have is the shortest, surest way to implant those highest cravings of the soul which seek and find repose only in harmony with the Divine will.

G. W. Cable.

THE CRICKET.

THE twilight is the morning of his day.
 While Sleep drops seaward from the fading shore,
 With purpling sail and dip of silver oar,
 He cheers the shadowed time with roundelay,
 Until the dark east softens into gray.
 Now as the noisy hours are coming — hark !
 His song dies gently — it is getting dark —
 His night, with its one star, is on the way.
 Faintly the light breaks over the blowing oats —
 Sleep, little brother, sleep : I am astir.
 Lead thou the starlit nights with merry notes,
 And I will lead the clamoring day with rhyme :
 We worship Song, and servants are of her —
 I in the bright hours, thou in shadow-time.

Charles Edwin Markham.

MY MEETING WITH THE POLITICAL EXILES.

OUR first meeting with political exiles in Siberia was brought about by a fortunate accident, and, strangely enough, through the instrumentality of the Government. Among the many officers whose acquaintance we made in Semipalatinsk was an educated and intelligent gentleman named Pavlovski,* who had long held an important position in the Russian service, and who was introduced to us as a man whose wide and accurate knowledge of Siberia, especially of the steppe provinces, might render him valuable to us, both as an adviser and as a source of trustworthy information. Although Mr. Pavlovski impressed me from the first as a cultivated, humane, and liberal man, I naturally hesitated to apply to him for information concerning the political exiles. The advice given me in St. Petersburg had led me to believe that the Government would regard with disapprobation any attempt on the part of a foreign traveler to investigate a certain class of political questions or to form the acquaintance of a certain class of political offenders; and I expected, therefore, to have to make all such investigations and acquaintances stealthily and by underground methods. I was not at that time aware of the fact that Russian officials and political exiles are often secretly in sympathy, and it would never have occurred to me to seek the aid of the one class in making the acquaintance of the other. In all of my early conversations with Mr. Pavlovski, therefore, I studiously avoided the subject of political exile, and gave him, I think, no reason whatever to suppose that I knew anything about the Russian revolutionary movement, or felt any particular interest in the exiled revolutionists.

In the course of a talk one afternoon about America, Mr. Pavlovski, turning the conversation abruptly, said to me, "Mr. Kennan, have you ever paid any attention to the movement of young people into Siberia?"

I did not at first see the drift nor catch the significance of this inquiry, and replied, in a qualified negative, that I had not, but that perhaps I did not fully understand the meaning of his question.

"I mean," he said, "that large numbers of educated young men and women are now coming into Siberia from European Russia;

* I am forced to conceal this gentleman's identity under a fictitious name.

I thought perhaps the movement might have attracted your attention."

The earnest, significant way in which he looked at me while making this remark, as if he were experimenting upon me or sounding me, led me to conjecture that the young people to whom he referred were the political exiles. I did not forget, however, that I was dealing with a Russian officer; and I replied guardedly that I had heard something about this movement, but knew nothing of it from personal observation.

"It seems to me," he said, looking at me with the same watchful intentness, "that it is a remarkable social phenomenon, and one that would naturally attract a foreign traveler's attention."

I replied that I was interested, of course, in all the social phenomena of Russia, and that I should undoubtedly feel a deep interest in the one to which he referred if I knew more about it.

"Some of the people who are now coming to Siberia," he continued, "are young men and women of high attainments—men with a university training and women of remarkable character."

"Yes," I replied, "so I have heard; and I should think that they might perhaps be interesting people to know."

"They are," he assented. "They are men and women who, under other circumstances, might render valuable services to their country; I am surprised that you have not become interested in them."

In this manner Mr. Pavlovski and I continued to fence cautiously for five minutes, each trying to ascertain the views of the other, without fully disclosing his own views, concerning the unnamed, but clearly understood, subject of political exile. Mr. Pavlovski's words and manner seemed to me to indicate that he himself regarded with great interest and respect the "young people now coming to Siberia"; but that he did not dare to make a frank avowal of such sentiments until he should feel assured of my discretion, trustworthiness, and sympathy. I, on my side, was equally cautious, fearing that the uncalled-for introduction of this topic by a Russian official might be intended to entrap me into an admission that the investigation of political exile was the real object of our Siberian journey. The adoption of a quasi-friendly attitude by an officer of the Government towards the

exiled enemies of that Government seemed to me an extraordinary and unprecedented phenomenon, and I naturally regarded it with some suspicion.

At last, tired of this conversational beating about the bush, I said frankly, "Mr. Pavlovski, are you talking about the political exiles? Are they the young people to whom you refer?"

"Yes," he replied; "I thought you understood. It seems to me that the banishment to Siberia of a large part of the youth of Russia is a phenomenon which deserves a traveler's attention."

"Of course," I said, "I am interested in it, but how am I to find out anything about it? I don't know where to look for political exiles, nor how to get acquainted with them; and I am told that the Government does not regard with favor intercourse between foreign travelers and political."

"Politicals are easy enough to find," rejoined Mr. Pavlovski. "The country is full of them, and [with a shrug of the shoulders] there is nothing, so far as I know, to prevent you from making their acquaintance if you feel so disposed. There are thirty or forty of them here in Semipalatinsk, and they walk about the streets like other people: why should n't you happen to meet them?"

Having once broken the ice of reserve and restraint, Mr. Pavlovski and I made rapid advances towards mutual confidence. I soon became convinced that he was not making a pretense of sympathy with the politicals in order to lead me into a trap; and he apparently became satisfied that I had judgment and tact enough not to get him into trouble by talking to other people about his opinions and actions. Then everything went smoothly. I told him frankly what my impressions were with regard to the character of "nihilists" generally, and asked him whether, as a matter of fact, they were not wrong-headed fanatics and wild social theorists, who would be likely to make trouble in any state.

"On the contrary," he replied, "I find them to be quiet, orderly, reasonable human beings. We certainly have no trouble with them here. Governor Tseklinski treats them with great kindness and consideration; and, so far as I know, they are good citizens."

In the course of further conversation, Mr. Pavlovski said that there were in Semipalatinsk, he believed, about forty political exiles,* including four or five women. They had all been banished without judicial trial, upon mere executive orders, signed by the Minister of the Interior and approved by the Tsar. Their terms of exile varied from two to five years; and at the expiration of such terms, if

their behavior meanwhile had been satisfactory to the local Siberian authorities, they would be permitted to return, at their own expense, to their homes. A few of them had found employment in Semipalatinsk and were supporting themselves; others received money from relatives or friends; and the remainder were supported — or rather kept from actual starvation — by a Government allowance, which amounted to six rubles (\$3.00) a month for exiles belonging to the noble or privileged class, and two rubles and seventy kopecks (\$1.35) a month for non-privileged exiles.

"Of course," said Mr. Pavlovski, "such sums are wholly inadequate for their support. Nine kopecks [four and a half cents] a day won't keep a man in bread, to say nothing of providing him with shelter; and if the more fortunate ones, who get employment or receive money from their relatives, did not help the others, there would be much more suffering than there is. Most of them are educated men and women, and Governor Tseklinski, who appreciates the hardships of their situation, allows them to give private lessons, although, according to the letter of the law, teaching is an occupation in which political exiles are forbidden to engage. Besides giving lessons, the women sew and embroider, and earn a little money in that way. They are allowed to write and receive letters, as well as to have unobjectionable books and periodicals; and although they are nominally under police surveillance, they enjoy a good deal of personal freedom."

"What is the nature of the crimes for which these young people were banished?" I inquired. "Were they conspirators? Did they take part in plots to assassinate the Tsar?"

"Oh, no!" said Mr. Pavlovski with a smile; "they were only neblagonadezhni [untrustworthy]. Some of them belonged to forbidden societies, some imported or were in possession of forbidden books, some had friendly relations with other more dangerous offenders, and some were connected with disorders in the higher schools and the universities. The greater part of them are administrative exiles — that is, persons whom the Government, for various reasons, has thought it expedient to remove from their homes and put under police surveillance in a part of the empire where they can do no harm. The real conspirators and revolutionists — the men and women who have actually been engaged in criminal activity — are sent to more remote parts of Siberia and into penal servitude. Banishment to the steppe provinces is regarded

* This estimate proved to be too large; the number was twenty-two.

MAP OF ROUTE TRAVELED IN THIS ARTICLE.

as a very light punishment; and, as a rule, only administrative exiles are sent here."

In reply to further questions with regard to the character of these political exiles, Mr. Pavlovski said, "I don't know anything to their discredit; they behave themselves well enough here. If you are really interested in them, I can, perhaps, help you to an acquaintance with some of them, and then you can draw your own conclusions as to their character."

Of course I assured Mr. Pavlovski that an introduction to the politicals would give me more pleasure than any other favor he could confer upon me. He thereupon suggested that we should go at once to see a young political exile named Lobonofski, who was engaged in painting a drop-curtain for the little town theater.

"He is something of an artist," said Mr. Pavlovski, "and has a few Siberian sketches. You are making and collecting such sketches: of course you want to see them."

"Certainly," I replied, with acquiescent diplomacy. "Sketches are my hobby, and I am a connoisseur in drop-curtains. Even although the artist be a nihilist and an exile, I must see his pictures."

Mr. Pavlovski's droshky was at the door, and we drove at once to the house where Mr. Lobonofski was at work.

I find it extremely difficult now, after a whole year of intimate association with political exiles, to recall the impressions that I had

of them before I made the acquaintance of the exile colony in Semipalatinsk. I know that I was prejudiced against them, and that I expected them to be wholly unlike the rational, cultivated men and women whom one meets in civilized society; but I cannot, by any exercise of will, bring back the unreal, fantastic conception of them which I had when I crossed the Siberian frontier. As nearly as I can now remember, I regarded the people whom I called "nihilists" as sullen, and more or

less incomprehensible "cranks," with some education, a great deal of fanatical courage, and a limitless capacity for self-sacrifice, but with the most visionary ideas of government and social organization, and with only the faintest trace of what an American would call "hard common-sense." I did not expect to have any more ideas in common with them than I should have in common with an anarchist like Louis Lingg; and although I intended to give their case against the Government a fair hearing, I believed that the result would be a confirmation of the judgment I had already formed. Even after all that Mr. Pavlovski had said to me, I think I more than half expected to find in the drop-curtain artist a long-haired, wild-eyed being, who would pour forth an incoherent recital of wrongs and outrages, denounce all governmental restraint as brutal tyranny, and expect me to approve of the assassination of Alexander II.

The log-house occupied by Mr. Lobonofski as a work-shop was not otherwise tenanted, and we entered it without announcement. As Mr. Pavlovski threw open the door, I saw, standing before a large square sheet of canvas which covered one whole side of the room, a blonde young man, apparently about thirty years of age, dressed from head to foot in a suit of cool brown linen, holding in one hand an artist's brush, and in the other a plate or palette covered with freshly mixed colors. His strongly built figure was erect

and well proportioned; his bearing was that of a cultivated gentleman; and he made upon me, from the first, a pleasant and favorable impression. He seemed, in fact, to be an excellent specimen of the blonde type of Russian young manhood. His eyes were clear and blue; his thick light brown hair was ill cut, and rimped a little in a boyish way over the high forehead; the full blonde beard gave manliness and dignity to his well-shaped head; and his frank, open, good-tempered face, flushed a little with heat and wet with perspiration, seemed to me to be the face of a warm-hearted and impulsive, but, at the same time, strong and well-balanced man. It was, at any rate, a face strangely out of harmony with all my preconceived ideas of a nihilist.

Mr. Pavlovski introduced me to the young artist as an American traveler, who was interested in Siberian scenery, who had heard of his sketches, and who would like very much to see some of them. Mr. Lobonofski greeted me quietly but cordially, and at once brought out the sketches—apologizing, however, for their imperfections, and asking us to remember that they had been made in prison, on coarse writing-paper, and that the outdoor views were limited to landscapes which could be seen from prison and *étape* windows. The sketches were evidently the work of an untrained hand, and were mostly representations of prison and *étape* interiors, portraits of political exiles, and such bits of towns and villages as could be seen from the windows of the various cells that the artist had occupied in the course of his journey to Siberia. They all had, however, a certain rude force and fidelity, and one of them served as material for the sketch illustrating the Tiumen prison-yard in *THE CENTURY MAGAZINE* for June.

My conversation with Mr. Lobonofski at this interview did not touch political questions, and was confined, for the most part, to topics suggested by the sketches. He described his journey to Siberia just as he would have described it if he had made it voluntarily, and but for an occasional reference to a prison or an *étape*, there was nothing in the recital to remind one that he was a nihilist and an exile. His manner was quiet, modest, and frank; he followed any conversational lead with ready tact, and although I watched him closely, I could not detect the slightest indication of eccentricity or "crankiness." He must have felt conscious that I was secretly regarding him with critical curiosity,—looking at him, in fact, as one looks for the first time at an extraordinary type of criminal,—but

he did not manifest the least awkwardness, embarrassment, or self-consciousness. He was simply a quiet, well-bred, self-possessed gentleman.

When we took our leave, after half an hour's conversation, Mr. Lobonofski cordially invited me to bring Mr. Frost to see him that evening at his house, and said that he would have a few of his friends there to meet us. I thanked him and promised that we would come.

"Well," said Mr. Pavlovski, as the door closed behind us, "what do you think of the political exile?"

"He makes a very favorable impression upon me," I replied. "Are they all like him?"

"No, not precisely like him; but they are not bad people. There is another interesting political in the city whom you ought to see—a young man named Leontief. He is employed in the office of Mr. Makovetski, a justice of the peace here, and is engaged with the latter in making anthropological researches among the Kirghis. I believe they are now collecting material for a monograph upon Kirghis customary law.* Why should n't you call upon Mr. Makovetski? I have no doubt that he would introduce Mr. Leontief to you, and I am sure that you would find them both to be intelligent and cultivated men."

This seemed to me a good suggestion; and as soon as Mr. Pavlovski had left me I paid a visit to Mr. Makovetski, ostensibly for the purpose of asking permission to sketch some of the Kirghis implements and utensils in the town library, of which he was one of the directors. Mr. Makovetski seemed pleased to learn that I was interested in their little library, granted me permission to sketch the specimens of Kirghis handiwork there exhibited, and finally introduced me to his writ-

ing-clerk, Mr. Leontief, who, he said, had made a special study of the Kirghis, and

* This monograph has since been published in the "Proceedings of the West Siberian Branch of the Imperial Geographical Society."

could give me any desired information concerning the natives of that tribe.

Mr. Leontief was a good-looking young fellow, apparently about twenty-five years of age, rather below the medium height, with light brown hair and beard, intelligent gray eyes, a slightly aquiline nose, and a firm, well-rounded chin. His head and face were suggestive of studious and scientific tastes, and if I had met him in Washington and had been asked to guess his profession from his appearance, I should have said that he was probably a young scientist connected with the United States Geological Survey, the Smithsonian Institution, or the National Museum. He was, as I subsequently learned, the son of an army officer who at one time commanded the Cossack garrison in this same city of Semipalatinsk. As a boy he was enrolled in the corps of imperial pages, and began his education in the large school established by the Government for the training of such pages in the Russian capital. At the age of eighteen or nineteen he entered the St. Petersburg University, and in the fourth year of his student life was arrested and exiled by "administrative process" to western Siberia for five years, upon the charge of having had secret communication with political prisoners in the fortress of Petropavlovsk.

Although Mr. Leontief's bearing was somewhat more formal and reserved than that of Mr. Lobonofski, and his attitude toward me one of cool, observant criticism, rather than of friendly confidence, he impressed me very favorably; and when, after half an hour's conversation, I returned to my hotel, I was forced to admit to myself that if all nihilists were like the two whom I had met in Semipalatinsk, I should have to modify my opinions with regard to them. In point of intelligence and education Mr. Lobonofski and Mr. Leontief seemed to me to compare favorably with any young men of my acquaintance.

At 8 o'clock that evening Mr. Frost and I knocked at Mr. Lobonofski's door, and were promptly admitted and cordially welcomed. We found him living in a small log-house not far from our hotel. The apartment into which we were shown, and which served in the double capacity of sitting-room and bedroom, was very small—not larger, I think, than ten feet in width by fourteen feet in length. Its log walls and board ceiling were covered with dingy whitewash, and its floor of rough unmatched planks was bare. Against a rude unpainted partition to the right of the door stood a small single bedstead of stained wood, covered with neat but rather scanty bed-clothing, and in the corner beyond it was a triangular table, upon which were lying, among other

books, Herbert Spencer's "Essays: Moral, Political, and Æsthetic," and the same author's "Principles of Psychology." The opposite corner of the room was occupied by a what-not, or *étagère*, of domestic manufacture, upon the shelves of which were a few more books, a well-filled herbarium, of coarse brown wrapping-paper, an opera-glass, and an English New Testament. Between two small deeply set windows opening into the court-yard stood a large unpainted wooden table, without a cloth, upon which was lying, open, the book that Mr. Lobonofski had been reading when we entered—a French translation of Balfour Stewart's "Conservation of Energy." There was no other furniture in the apartment except three or four unpainted wooden chairs. Everything was scrupulously neat and clean; but the room looked like the home of a man too poor to afford anything more than the barest essentials of life.

After Mr. Lobonofski had made a few preliminary inquiries with regard to the object of our journey to Siberia, and had expressed the pleasure which he said it afforded him to meet and welcome Americans in his own house, he turned to me with a smile and said, "I suppose, Mr. Kennan, you have heard terrible stories in America about the Russian nihilists?"

"Yes," I replied; "we seldom hear of them except in connection with a plot to blow up something or to kill somebody, and I must confess that I have had a bad opinion of them. The very word 'nihilist' is understood in America to mean a person who does not believe in anything and who advocates the destruction of all existing institutions."

"'Nihilist' is an old name," he said; "and it is no longer applicable to the Russian revolutionary party, if, indeed, it was ever applicable. I don't think you will find among the political exiles in Siberia any 'nihilists,' in the sense in which you use the word. Of course there are, in what may be called the anti-Government class, people who hold all sorts of political opinions. There are a few who believe in the so-called policy of 'terror'—who regard themselves as justified in resorting even to political assassination as a means of overthrowing the Government; but even the terrorists do not propose to destroy all existing institutions. Every one of them would, I think, lay down his arms, if the Tsar would grant to Russia a constitutional form of government and guarantee free speech, a free press, and freedom from arbitrary arrest, imprisonment, and exile. Have you ever seen the letter sent by the Russian revolutionists to Alexander III. upon his accession to the throne?"

FIRST VIEW OF THE ALTAI MOUNTAINS.

"No," I replied; "I have heard of it, but have never seen it."

"It sets forth," he said, "the aims and objects of the revolutionary party, and contains a distinct promise that if the Tsar will grant freedom of speech and summon a national assembly the revolutionists will abstain from all further violence, and will agree not to oppose any form of government which such assembly may sanction.* You can hardly say that people who express a willingness to enter into such an agreement as this are in favor of the destruction of all existing institutions. I suppose you know," he continued, "that when your President Garfield was assassinated, the columns of 'The Messenger of the Will of the People' [the organ of the Russian revolutionists in Geneva] were bordered with black as a token of grief and sympathy, and that the paper contained an eloquent editorial condemning political assassination as wholly unjustifiable in a country where there are open courts and a free press, and where the officers of the Government are chosen by a free vote of the people?"

"No," I replied; "I was not aware of it."

"It is true," he rejoined. "Of course at that time Garfield's murder was regarded as a political crime, and as such it was condemned in Russia, even by the most extreme terrorists."

Our conversation was interrupted at this point by the entrance of three young men

* I now have in my possession a copy of this letter. A part of it may be found translated in Stepniak's "The Russian Storm Cloud," p. 6.

and a lady, who were introduced to us as Mr. Lobonofski's exile friends. In the appearance of the young men there was nothing particularly striking or noticeable. One of them seemed to be a bright university student, twenty-four or twenty-five years of age, and the other two looked like educated peasants or artisans, whose typically Russian faces were rather heavy, impassive, and gloomy, and whose manner was lacking in animation and responsiveness. Life and exile seemed to have gone hard with them, and to have left them depressed and embittered. The lady, whose name was Madame Dicheskula, represented apparently a different social class, and had a more buoyant and sunny disposition. She was about thirty years of age, tall and straight, with a well-proportioned but somewhat spare figure, thick, short brown hair falling in a soft mass about the nape of her neck, and a bright, intelligent, mobile face, which I thought must once have been extremely pretty. It had become, however, a little too thin and worn, and her complexion had been freckled and roughened by exposure to wind and weather and by the hardships of prison and *étape* life. She was neatly and becomingly dressed in a Scotch plaid gown of soft dark serge, with little ruffles of white lace at her throat and wrists; and when her face lighted up in animated conversation, she seemed to me to be a very attractive and interesting woman. In her demeanor there was not a suggestion of the boldness, hardness, and eccentricity which I had expected to find in women exiled to Siberia for

political crime. She talked rapidly and well; laughed merrily at times over reminiscences of her journey to Siberia; apologized for the unwomanly shortness of her hair, which, she said, had all been cut off in prison; and related with a keen sense of humor her adventures while crossing the Kirghis steppe from Akmola to Semipalatinsk. That her natural

About 9 o'clock Mr. Lobonofski brought in a steaming samovar, Madame Dicheskula made tea, and throughout the remainder of the evening we all sat around the big pine table as if we had been acquainted for months instead of hours, talking about the Russian revolutionary movement, the exile system, literature, art, science, and American politics.

buoyancy of disposition was tempered by deep feeling was evident from the way in which she described some of the incidents of her Siberian experience. She seemed greatly touched, for example, by the kindness shown to her party by the peasants of Kamishlova, a village through which they passed on their way from Ekaterineburg to Tiumen. They happened to arrive there on Trinity Sunday, and were surprised to find that the villagers, as a manifestation of sympathy with the political exiles, had thoroughly scoured out and freshened up the old village étape, and had decorated its gloomy cells with leafy branches and fresh wild-flowers. It seemed to me that tears came to her eyes as she expressed her deep and grateful appreciation of this act of thoughtfulness and good-will on the part of the Kamishlova peasants.

THE ALTAI STATION AND OUR HOUSE THERE.

The cool, reasonable way in which these exiles discussed public affairs, problems of government, and their personal experience impressed me very favorably. There was none of the bitterness of feeling and extravagance of statement which I had anticipated, and I did not notice in their conversation the least tendency to exaggerate or even to dwell upon their own sufferings as a means of exciting our sympathy. Madame Dicheskula, for instance, had been robbed of most of her clothing and personal effects by the police at the time of

her arrest; had spent more than a year in solitary confinement in the Moscow forward-prison; had then been banished, without trial, to a dreary settlement in the Siberian province of Akmolinsk; and, finally, had been brought across the great Kirghis steppe in winter to the city of Semipalatinsk. In all this experience there must have been a great deal of intense personal suffering; but she did not lay half as much stress upon it in conversation as she did upon the decoration of the old *étape* with leafy branches and flowers by the people of Kamishlova, as an expression of sympathy with her and her exiled friends. About 11 o'clock, after a most pleasant and interesting evening, we bade them all good-night and returned to our hotel.

On the following morning Mr. Lobonofski, Madame Dicheskula, Mr. Frost, and I took droshkies and drove down the right bank of the Irtysh a mile or two, to a small grove of poplars and aspens near the water's edge, where six or eight political exiles were spending the summer in camp. A large Kirghis "yourt" of felt, and two or three smaller cotton tents, had been pitched on the grass under the trees, and in them were living two or three young women and four or five young men, who had taken this means of escaping from the heat, glare, and sand of the verdureless city. Two of the women were mere girls, seventeen or eighteen years of age, who looked as if they ought to be pursuing their education in a high school or a female seminary, and why they had been exiled to Siberia I could not imagine. It did not seem to me possible that they could be regarded in any country, or under any circumstances, as a dangerous menace to social order or to the stability of the government. As I shook hands with them and noticed their shy, embarrassed behavior, and the quick flushes of color which came to their cheeks when I spoke to them, I experienced for the first time something like a feeling of contempt for the Russian Government. "If I were the Tsar," I said to Mr. Frost, "and had an army of soldiers and police at my back, and if, nevertheless, I felt so afraid of timid, half-grown school-girls that I could not sleep in peaceful security until I had banished them to Siberia, I think I should abdicate in favor of some stronger and more courageous man." The idea that a powerful government like that of Russia could not protect itself against seminary girls and Sunday-school teachers without tearing them from their families, and isolating them in the middle of a great Asiatic desert, seemed to me not only ludicrous, but absolutely preposterous.

We spent in the pleasant shady camp of these political exiles nearly the whole of

the long, hot summer day. Mr. Frost made sketches of the picturesquely grouped tents, while I talked with the young men, read Irving aloud to one of them who was studying English, answered questions about America, and asked questions in turn about Siberia and Russia. Before the day ended we were upon as cordial and friendly a footing with the whole party as if we had known them for a month.

Late in the afternoon we returned to the city, and in the evening went to the house of Mr. Leontief, where most of the political exiles whom we had not yet seen had been invited to meet us. The room into which we were ushered was much larger and better furnished than that in which Mr. Lobonofski lived; but nothing in it particularly attracted my attention except a portrait of Herbert Spencer, which hung on the wall over Mr. Leontief's desk. There were twelve or fifteen exiles present, including Mr. Lobonofski, Madame Dicheskula, Dr. Bogomolets,—a young surgeon whose wife was in penal servitude at the mines of Kara,—and the two Prisedski sisters, to whom reference was made in my article upon the "Prison Life of the Russian Revolutionists," in *THE CENTURY MAGAZINE* for December. The general conversation which followed our introduction to the assembled company was bright, animated, and informal. Mr. Leontief, in reply to questions from me, related the history of the Semipalatinsk library, and said that it had not only been a great boon to the political exiles, but had noticeably stimulated the intellectual life of the city. "Even the Kirghis," he said, "occasionally avail themselves of its privileges. I know a learned old Kirghis here, named Ibrahim Konobai, who not only goes to the library, but reads such authors as Buckle, Mill, and Draper."

"You don't mean to say," exclaimed a young university student, "that there is any old Kirghis in Semipalatinsk who actually reads Mill and Draper!"

"Yes, I do," replied Mr. Leontief, coolly. "The very first time I met him he astonished me by asking me to explain to him the difference between induction and deduction. Some time afterward I found out that he was really making a study of English philosophy, and had read Russian translations of all the authors that I have named."

"Do you suppose that he understood what he read?" inquired the university student.

"I spent two whole evenings in examining him upon Draper's 'Intellectual Development of Europe,'" replied Mr. Leontief; "and I must say that he seemed to have a very fair comprehension of it."

PICNIC GROUND, VALLEY OF THE BUKHTARMA.

"I notice," I said, "that a large number of books in the library — particularly the works of the English scientists — have been withdrawn from public use, although all of them seem once to have passed the censor. How does it happen that books are at one time allowed and at another time prohibited?"

"Our censorship is very capricious," replied one of the exiles. "How would you explain the fact that such a book as Adam Smith's 'Wealth of Nations' is prohibited, while Darwin's 'Origin of Species' and 'Descent of Man' are allowed? The latter are certainly more dangerous than the former."

"It has been suggested," said another, "that the list of prohibited books was made up by putting together, without examination, the titles of all books found by the police in the quarters of persons arrested for political offenses. The 'Wealth of Nations' happened to be found in some unfortunate revolutionist's house, therefore the 'Wealth of Nations' must be a dangerous book."

"When I was arrested," said Mr. Lobonofski, "the police seized and took away even a French history which I had borrowed from the public library. In looking hastily through it they noticed here and there the word 'revolution,' and that was enough. I tried to make them understand that a French history must, of course, treat of the French Revolution, but it was of no use. They also carried off,

under the impression that it was an infernal machine, a rude imitation of a steam-engine which my little brother had made for amusement out of some bits of wood and metal and the tubes of an old opera-glass." Amidst general laughter, a number of the exiles related humorous anecdotes illustrating the methods of the Russian police, and then the conversation drifted into other channels.

As an evidence of the intelligence and culture of these political exiles, and of the wide range of their interests and sympathies, it seems to me worth while to say that their conversation showed more than a superficial acquaintance with the best English and American literature, as well as a fairly accurate knowledge of American institutions and history. Among the authors referred to, discussed, or quoted by them that evening were Shakspeare, Mill, Spencer, Buckle, Balfour Stewart, Heine, Hegel, Lange, Irving, Cooper, Longfellow, Bret Harte, and Harriet Beecher Stowe. They knew the name and something of the record of our newly elected President; discussed intelligently his civil-service reform policy and asked pertinent questions with regard to its working, and manifested generally an acquaintance with American affairs which one does not expect to find anywhere on the other side of the Atlantic, and least of all in Siberia.

After a plain but substantial supper, with

delicious overland tea, the exiles sang for us in chorus some of the plaintive popular melodies of Russia, and Mr. Frost and I tried, in turn, to give them an idea of our college songs, our war songs, and the music of the American negroes. It must have been nearly midnight when we reluctantly bade them all good-bye and returned to the Hotel Sibir.

It is impossible, of course, within the limits of a single magazine article, to give even the

men and women, with warm affections, quick sympathies, generous impulses, and high standards of honor and duty. They are, as Mr. Pavlovski said to me, "men and women who, under other circumstances, might render valuable services to their country." If, instead of thus serving their country, they are living in exile, it is not because they are lacking in the virtue and the patriotism which are essential to good citizenship, but because the Government,

COSSACK PICKET OF JINGISTAI.

substance of the long conversations concerning the Russian Government and the Russian revolutionary movement which I had with the political exiles in Semipalatinsk. All that I aim to do in the present paper is to describe, as fairly and accurately as possible, the impression which these exiles made upon me. If I may judge others by myself, American readers have had an idea that the people who are called nihilists stand apart from the rest of mankind in a class by themselves, and that there is in their character something fierce, gloomy, abnormal, and, to a sane mind, incomprehensible, which alienates from them, and which should alienate from them, the sympathies of the civilized world. If the political exiles in Semipalatinsk be taken as fair representatives of the class thus judged, the idea seems to me to be a wholly mistaken one. I found them to be bright, intelligent, well-informed

which assumes the right to think and act for the Russian people, is out of harmony with the spirit of the time.

On Saturday, July 18, after having inspected the city prison, obtained as much information as possible concerning the exile system, and made farewell calls upon our friends, we provided ourselves with a new padorozhnaya and left Semipalatinsk with three post-horses for the mountains of the Altai. The wild alpine region which we hoped to explore lies along the frontier of Mongolia, about 350 miles east of Semipalatinsk and nearly 600 miles due south from Tomsk. The German travelers Finsch and Brehm went to the edge of it in 1876, but the high snowy peaks of the Katunski and Chuiski Alps, east of the Altai Station, had never been seen by a foreigner, and had been visited by very few Russians.

For nearly two hundred versts, after leaving Semipalatinsk, we rode up the right bank of the Irtish, through a great rolling steppe of dry yellowish grass. Here and there, where this steppe was irrigated by small streams running into the Irtish, it supported a luxuriant vegetation, the little transverse valleys being filled with wild roses, hollyhocks, golden-rod, wild currant and gooseberry bushes, and splendid spikes, five feet in height, of dark blue aconite;

desert. The thermometer ranged day after day from 90 to 103° in the shade; the atmosphere was suffocating; every leaf and every blade of grass, as far as the eye could reach, had been absolutely burned dead by the fierce sunshine; great whirling columns of sand, 100 to 150 feet in height, swept slowly and majestically across the sun-scorched plain; and we could trace the progress of a single mounted Kirghis five miles away by the cloud of

VILLAGE OF ARUL.

but in most places the great plain was sun-scorched and bare. The Cossack villages through which we passed did not differ materially from those between Semipalatinsk and Omsk, except that their log-houses were newer and in better repair, and their inhabitants seemed to be wealthier and more prosperous. The Russian love of crude color became again apparent in the dresses of the women and girls; and on Sunday, when all of the Cossacks were in holiday attire, the streets of these villages were bright with the red, blue, and yellow costumes of the young men and women, who sat in rows upon benches in the shade of the houses, talking, flirting, and eating melon seeds, or, after the sun had gone down, danced in the streets to the music of fiddles and triangular guitars.

The farther we went up the Irtish the hotter became the weather and the more barren the steppe, until it was easy to imagine that we were in an Arabian or a north African

dust which his horse's hoofs raised from the steppe. I suffered intensely from heat and thirst, and had to protect myself from the fierce sunshine by swathing my body in four thicknesses of blanket and putting a big down pillow over my legs. I could not hold my hand in that sunshine five minutes without pain, and wrapping my body in four thicknesses of heavy woolen blanketing gave me at once a sensation of coolness. Mine was the southern or sunny side of the tarantas, and I finally became so exhausted with the fierce heat, and had such a strange feeling of faintness, nausea, and suffocation, that I asked Mr. Frost to change sides with me, and give me a brief respite. He wrapped himself up in a blanket, put a pillow over his legs, and managed to endure it until evening. Familiar as I supposed myself to be with Siberia, I little thought, when I crossed the frontier, that I should find in it a north African desert, with whirling sand-columns,

and sunshine from which I should be obliged to protect my limbs with blankets. I laughed at

a Russian officer in Omsk who told me that the heat in the valley of the Irtysh was often so intense as to cause nausea and fainting, and who advised me not to travel between 11 o'clock in the morning and 3 in the afternoon, when the day was cloudless and hot. The idea of having a sunstroke in Siberia, and the suggestion not to travel there in the middle of the day, seemed to me so preposterous that I could not restrain a smile of amusement.

He assured me, however, that he was talking seriously, and said that he had seen soldiers unconscious for hours after a fit of nausea and fainting, brought on by marching in the sunshine. He did not know sunstroke by name, and seemed to think that the symptoms which he described were peculiar effects of the Irtysh valley heat, but it was evidently sunstroke that he had seen.

At the station of Voroninskaya, in the middle of this parched desert, we were overtaken by a furious hot sand-storm from the southwest, with a temperature of 103° in the shade. The sand and fine hot dust were carried to a height of a hundred feet, and drifted past us in dense, suffocating clouds, hiding everything from sight and making it almost impossible to breathe. Although we were riding with the storm, and not against it, I literally gasped

for breath for more than two hours; and when we arrived at the station of Cheremshanka, it would have been hard to tell, from an inspection of our faces, whether we were Kirghis or Americans — black men or white. I drank nearly a quart of cold milk, and even that did not fully assuage my fierce thirst. Mr. Frost, after washing the dust out of his eyes and drinking seven tumblers of milk, revived sufficiently to say, "If anybody thinks that it does n't get hot in Siberia, just refer him to me!"

ASCENT OF MOUNTAIN-TRAIL FROM BEREL.

H. Sanderson

At the station of Malo Krasnoyarskaya we left the Irtysh to the right and saw it no more. Late that afternoon we reached the first foothills of the great mountain range of the Altai, and began the long, gradual climb to the Altai Station. Before dark on the following day we were riding through cool, elevated alpine meadows, where the fresh green grass was intermingled with bluebells, fragrant spirea, gentians, and delicate fringed pinks, and

9000 feet in height, crowned with 1000 feet of fresh, brilliantly white snow, and belted with a broad zone of evergreen forest; beneath lay a beautiful, park-like valley, through which ran the road, under the shade of scattered larches, across clear rushing mountain streams which came tumbling down in cascades from the melting snows above, and over grassy meadows sprinkled with wild pansies, gentians, fringed pinks, and ripening strawberries. After

KIRGHIS ENCAMPMENT ON THE SUMMIT.

where the mountain tops over our heads were white, a thousand feet down, with freshly fallen snow. The change from the torrid African desert of the Irtysh to this superb Siberian Switzerland was so sudden and so extraordinary as to be almost bewildering. I could not help asking myself every fifteen minutes, "Did I only dream of that dreary, sun-scorched steppe yesterday, with its sand spouts, its mountains of furnace slag, its fierce heat, and its whitening bones, or is it really possible that I can have come from that to this in twenty-four hours?" To my steppe-wearied eyes the scenery, as we approached the Altai Station, was indescribably beautiful. On our left was a range of low mountains, the smooth slopes of which were checkered with purple cloud shadows and tinted here and there by vast areas of flowers; on our right, rising almost from the road, was a splendid chain of bold, grandly sculptured peaks from 7000 to

three thousand miles of almost unbroken plain, or steppe, this scene made upon me a most profound impression. We reached the Altai Station — or, as the Kirghis call it, "Koton Karaghai" — about 6 o'clock in the cool of a beautiful, calm, midsummer afternoon. I shall never forget the enthusiastic delight which I felt as I rode up out of a wooded valley fragrant with wild-flowers, past a picturesque cluster of colored Kirghis tents, across two hundred yards of smooth elevated meadow, and then, stopping at the entrance to the village, turned back and looked at the mountains. Never, I thought, had I seen an alpine picture which could for a moment bear comparison with it. I have seen the most beautiful scenery in the mountains of the Sierra Nevada, of Nicaragua, of Kamtchatka, of the Caucasus, and of the Russian Altai, and it is my deliberate opinion that for varied beauty, picturesque, and effectiveness that mountain

DISTANT VIEW OF THE KATUNSKI ALPS.

landscape is absolutely unsurpassed. If there exist a more superbly situated village than the Altai Station, I am ready to cross three oceans to see it.

The station itself is a mere Cossack outpost with seventy or eighty log-houses, with wide, clean streets between them and with a quaint wooden church at one end; but to a traveler just from the hot, arid plains of the Irtysh even this insignificant Cossack hamlet has its peculiar charm. In front of every house in the settlement is a little inclosure, or front yard, filled with young birches, silver-leaved aspens, and flowering shrubs; and through all of these yards, down each side of every street, runs a tinkling, gurgling stream of clear, cold water from the melting snows on the mountains. The whole village, therefore, go where you will, is filled with the murmur of falling water; and how pleasant that sound is, you must travel for a month in the parched, dust-smothered, sun-scorched valley of the Irtysh fully to understand. The little rushing streams seem to bring with them, as they tumble in rapids through the settlement, the fresh, cool atmosphere of the high peaks where they were born two hours before; and although your thermometer may say that the day is hot and the air sultry, its statements are so persistently, so confidently, so hilariously controverted by the joyous voice of the stream under your window with its half-expressed suggestions of

snow and glaciers and cooling spray, that your reason is silenced and your imagination accepts the story of the snow-born brook.

We remained at the Altai Station three or four days, making excursions into the neighboring mountains with the Russian commander of the post and his wife, visiting and photographing the Kirghis who were encamped near the village, and collecting information with regard to the region lying farther to the eastward which we purposed to explore.

On Monday, July 27, we started for a trip of about two hundred versts, on horseback, to the Katunski Alps, or "Beilki," which are said to be the highest and wildest peaks of the Russian Altai. The day of our departure happened to be the namesday of Captain Maiefski, the Russian commander of the post; and in order to celebrate that namesday, and at the same time give us a pleasant "send off," he invited a party of friends to go with us as far as the rapids of the Bukhtarma River, about fifteen versts from the station, and there have a picnic. When we started, therefore, we were accompanied by Captain Maiefski and his wife and daughter, the Cossack ataman and his wife, a political exile named Zavalishin and his wife, and three or four other officers and ladies. The party was escorted by ten or fifteen mounted Kirghis in bright-colored "beshmets," girt about the waist with silver-studded belts; and the cavalcade of uniformed officers,

gayly dressed ladies, and hooded Kirghis presented, at least to our eyes, a most novel and picturesque appearance, as it cantered away across the grassy plateau upon which the station is situated, and descended into the green, flowery valley of the Bukhtarma. Captain Maiefski had sent forward to the rapids

newly built log-houses situated in the shallow, flower-carpeted valley of the Bukhtarma; and on Tuesday we passed through the picturesque village of Arul and reached a Cossack station called Berel, where we expected to leave the Bukhtarma valley and plunge into the mountains.

THE RAKHMANOVSKI HOT SPRINGS.

early in the morning two Kirghis yourts, a quantity of rugs and pillows, and his whole housekeeping outfit; and when we arrived we found the tents pitched in a beautiful spot among the trees beside the Bukhtarma, where camp-fires were already burning, where rugs and pillows were spread for the ladies, and where delicious tea was all ready for our refreshment. After an excellently cooked and served dinner of soup, freshly caught fish, roast lamb, boiled mutton, cold chicken, pilau of rice with raisins, strawberries, and candies, we spent a long, delightful afternoon in botanizing, fishing, rifle-shooting, catching butterflies, telling riddles, and singing songs. It was, I think, the most pleasant and successful picnic that I ever had the good fortune to enjoy; and when, late in the afternoon, Mr. Frost and I bade the party good-bye, I am sure we both secretly wished we could stay there in camp for a week, instead of going to the Katsunski Alps.

We spent that night at the little Cossack picket of Jingistai, which consisted of two

Wednesday morning, with two Cossack guides, five Kirghis horses, a tent, and a week's provisions, we forded the milky current of the Berel River, and climbed slowly for two hours in zigzags up a steep Kirghis trail which led to the crest of an enormous mound-shaped foot-hill behind the village. After stopping for a few moments at a Kirghis encampment on the summit, two or three thousand feet above the bottom of the Bukhtarma valley, we tightened our saddle-girths and plunged into the wilderness of mountains, precipices, and wild ravines which lay to the northward.

Late in the afternoon, after an extremely difficult and fatiguing journey of 25 or 30 versts, we rode 2000 or 3000 feet down a steep, slippery, break-neck descent, into the beautiful valley of the Rakhmanofski Hot Springs, where, shut in by high mountains, we found a clear little alpine lake, framed in greenery and flowers, and two untenanted log-houses, in one of which we took up our quarters for the night. When we awoke on the fol-

lowing morning rain was falling heavily, and horseback travel in such a country was evidently out of the question. The storm continued, with an occasional brief intermission, for two days; but on the morning of the third the weather finally cleared up, and without waiting for the mountain slopes to become dry, we saddled our horses and went on.

The last sixty versts of our journey were made with great difficulty and much peril, our route lying across tremendous mountain ridges and deep valleys with almost precipitous sides, into which we descended by following the course of foaming mountain torrents, or clambering down the moraines of extinct glaciers, over great heaped-up masses of loose, broken rocks, through swamps, tangled jungles of laurel bushes and fallen trees, and down slopes so steep that it was almost impossible to throw one's body far enough back to keep one's balance in the saddle. Half the time our horses were sliding on all four feet, and dislodging stones which rolled or bounded for half a mile downward, until they were dashed to pieces over tremendous precipices. I was not wholly inexperienced in mountain travel, having ridden on horseback the whole length of the mountainous peninsula of Kamtchatka and crossed three times the great range of the Caucasus, once at a height of twelve thousand feet; but I must confess that during our descents into the valleys of the Rakhmanofski, the Black Berel, the White Berel, and the Katun my heart was in my mouth for hours at a time. On any other horses than those of the Kirghis such descents would have been utterly impossible. My horse fell with me once, but I was not hurt. The region through which we passed is a primeval wilderness, traversed only by the "Diko-Kammenni Kirghis," or "Kirghis of the Wild Rocks," and abounding in game. We saw "marals," or Siberian elk, wolves, wild sheep, and many fresh trails made by bears in the long grass of the valley bottoms. On horseback we chased wild goats, and might have shot hundreds of partridges, grouse, ducks, geese, eagles, and cranes. The flora of the lower mountain valleys was extremely rich, varied, and luxuriant, comprising beautiful wild pansies of half a dozen varieties and colors, fringed pinks, spirea, two species of gentian, wild hollyhocks, daisies, forget-me-nots, alpine roses, trollius, wild poppies, and

THE DESCENT INTO THE VALLEY OF THE WHITE BEREL.

scores of other flowers that I had never before seen, many of them very large, brilliant, and showy. Among plants and fruits which with us are domesticated, but which in the Altai grow wild, I noticed rhubarb, celery, red currants, black currants, gooseberries, raspberries, strawberries, blackberries, wild cherries, crab-apples, and wild apricots. Most of the berries were ripe, or nearly ripe, and the wild currants were as large and abundant as in an American garden. The scenery was extremely wild and grand, surpassing, at times, anything that I had seen in the Caucasus.

On Saturday, August 1, we reached the foot of the last great ridge, or water-shed, which separated us from the main chain of the Katunski Alps, and camped for the night in a high mountain valley beside the White Berel, a milky stream which runs out from under a great glacier a few miles higher up. The air was clear and frosty, but we built a big campfire and managed to get through the night without much discomfort. Sunday morning we

climbed about two thousand feet to the summit of the last ridge, and looked over into the wild valley of the Katun, out of which rise the "Katunski Pillars," the highest peaks of the Russian Altai. I was prepared, to a certain extent, for grandeur of scenery, because I had already caught glimpses of these peaks two or three times, at distances varying from twenty-five to eighty miles; but the near view, from the heights above the Katun, so far surpassed all my anticipations that I was simply overawed. I hardly know how to describe it

mous glaciers, the largest of them descending from the saddle between the twin summits in a series of ice falls for at least 4000 feet. The glacier on the extreme right had an almost perpendicular ice fall of 1200 or 1500 feet, and the glacier on the extreme left gave birth to a torrent which tumbled about 800 feet, with a hoarse roar, into the deep narrow gorge. The latter glacier was longitudinally divided by three moraines, which looked from our point of view like long, narrow, A-shaped dumps of furnace slag or fine coal dust, but which were

THE "KATUNSKI PILLARS"—SOURCE OF THE KATUN RIVER.

without using language which will seem exaggerated. The word which oftenest rises to my lips when I think of it is "tremendous." It was not beautiful, it was not picturesque; it was tremendous and overwhelming. The narrow valley, or gorge, of the Katun, which lay almost under our feet, was between 2000 and 3000 feet deep. On the other side of it rose, far above our heads, the wild, mighty chain of the Katunski Alps, culminating just opposite us in two tremendous snowy peaks whose height I estimated at 15,000 feet.* They were white from base to summit, except where the snow was broken by great black precipices, or pierced by sharp, rocky spines, or aiguilles. Down the sides of these peaks, from vast fields of névé above, fell seven enor-

in reality composed of black rocks, from the size of one's head to the size of a freight car, and extended 4 or 5 miles, with a width of 300 feet and a height of from 50 to 75 feet above the general level of the glacier. The extreme summits of the two highest peaks were more than half of the time hidden in clouds; but this rather added to than detracted from the wild grandeur of the scene, by giving mystery to the origin of the enormous glaciers, which at such times seemed to the imagination to be tumbling down from unknown heights in the sky through masses of rolling vapor. All the time there came up to us from the depths of the gorge the hoarse roar of the waterfall, and with it blended, now and then, the deeper thunder of the great glaciers, as masses of ice gave way and settled into new positions in the ice falls. This thundering of the glaciers continued for nearly a minute at a time, varying in intensity, and resembling occasionally the sound of a distant but heavy

* Captain Maieski's estimate of their height was 18,000 feet above the sea level. They have never been climbed nor measured, and I do not even know the height above the sea of the valley bottom from which they rise.

and rapid cannonade. No movement of the ice in the falls was perceptible to the eye from the point at which we stood, but the sullen, rumbling thunder was evidence enough of the mighty force of the agencies which were at work before us.

After looking at the mountains for half an hour, we turned our attention to the valley of the Katun beneath us, with the view to ascertaining whether it would be possible to get down into it and reach the foot of the main glacier, which gave birth to the Katun River. Mr. Frost declared the descent to be utterly impracticable, and almost lost patience with me because I insisted upon the guides trying it. "Anybody can see," he said, "that this slope ends in a big precipice; and even if we get our horses down there, we never can get them up again. It is foolish to think of such a thing." I had seen enough, however, of Kirghis horses to feel great confidence in their climbing abilities; and although the descent did look very dangerous, I was by no means satisfied that it was utterly impracticable. While we were discussing the question, our guide was making a bold and practical attempt to solve it. We could no longer see him from where we stood, but every now and then a stone or small boulder, dislodged by his horse's feet, would leap suddenly into sight 300 or 400 feet below us, and go crashing down the mountain side, clearing 200 feet at every bound, and finally dashing itself to pieces against the rocks at the bottom, with a noise like the distant rattling discharge of musketry. Our guide was evidently making progress. In a few moments he came into sight on a bold, rocky buttress about six hundred feet below us and shouted cheerfully, "Come on! This is nothing! You could get down here with a teegal!" Inasmuch as one could hardly look down there without getting dizzy, this was rather a hyperbolical statement of the possibilities of the case; but it had the effect of silencing Mr. Frost, who took his horse by the bridle and followed me down the mountain in cautious zigzags, while I kept as nearly as I could in the track of our leader. At the buttress the guide tightened my forward and after saddle-girths until my horse groaned and grunted an inarticulate protest, and I climbed again into the saddle. It seemed to me safer, on the whole, to ride down than to

THE DESCENT INTO THE GORGE OF THE KATUN.

try to walk down leading my horse, since in the latter case he was constantly sliding upon me, or dislodging loose stones which threatened to knock my legs from under me and launch me into space like a projectile from a catapult. The first hundred feet of the descent were very bad. It was almost impossible to keep in the saddle on account of the steepness of the incline, and once I just escaped being pitched over my horse's head at the end of one of his short slides. We finally reached a very steep but grassy slope, like the side of a titanic embankment, down which we zigzagged, with much discomfort but without any danger, to the bottom of the Katun valley. As we rode towards the great peaks, and finally, leaving our horses, climbed up on the principal glacier, I saw how greatly we had underestimated distances, heights, and magnitudes from the elevated position which we had previously occupied. The Katun River, which from above had looked like a narrow, dirty white ribbon that a child could step across, proved to be a torrent, thirty or forty feet wide, with a current almost deep and strong enough to sweep away a horse and rider. The main glacier, which I had taken to be about 300 feet wide, proved

to have a width of more than half a mile; and its central moraine, which had looked to me like a strip of black sand piled up to the height

We spent all the remainder of the day in sketching, taking photographs, and climbing about the glacier and the valley, and late in

PART OF GREAT GLACIER FROM CENTRAL MORAINÉ —
KATUNSKI WATERFALL.

of 6 or 7 feet like a long furnace dump, proved to be an enormous mass of gigantic rocks, 3 or 4 miles long and from 300 to 400 feet wide, piled up on the glacier in places to the height of 75 feet. Mr. Frost estimated the width of this glacier at two-thirds of a mile, and the extreme height of the moraine at a hundred feet.

I took the photographic apparatus, and in the course of an hour and a half succeeded in climbing up the central moraine about two miles towards the foot of the great ice fall; but by that time I was tired out and dripping with perspiration. I passed many wide crevasses into which were running streams of water from the surface of the glacier; and judging from the duration of the sound made by stones which I dropped into some of them, they must have had a depth of a hundred feet, perhaps much more. This was only one of eleven glaciers which I counted from the summit of the high ridge which divides the water-shed of the Irtish from that of the Ob. Seven glaciers descend from the two main peaks alone.

the afternoon returned to our camp in the valley of the White Berel. That night—the 2d of August—was even colder than the preceding one. Ice formed to the thickness of more than a quarter of an inch in our tea-kettle, and my blankets and pillow, when I got up in the morning, were covered with thick white frost.

Monday we made another excursion to the summit of the ridge which overlooks the valley of the Katun, and succeeded in getting a good photograph of the two big peaks, against a background of cloudless sky. Our little instrument, of course, could not take in a quarter of the mighty landscape, and what it did take in it reduced to so small a scale that all of the grandeur and majesty of the mountains was lost; but it was a satisfaction to feel that we could carry away something which would

GORGE OF THE KATUN FROM THE FOOT OF THE GLACIER.

suggest and recall to us in later years the sublimity of that wonderful alpine picture.

for the Rakhmanofski Hot Springs; and on the 5th of August, after an absence of ten days, we returned to the Altai Station.

Monday noon we broke camp and started

George Kennan.

DEATH.

I AM the key that parts the gates of Fame;
I am the cloak that covers cowering Shame;
I am the final goal of every race;
I am the storm-tossed spirit's resting-place:

The messenger of sure and swift relief,
Welcomed with wailings and reproachful grief;
The friend of those that have no friend but me,
I break all chains, and set all captives free.

I am the cloud that, when Earth's day is done,
An instant veils an unextinguished sun;
I am the brooding hush that follows strife,
The waking from a dream that Man calls — Life!

"SAY, TOM, WON'T YOU WAIT FOR ME?" (SEE PAGE 532.)

XXXI.

HIRAM AND BARBARA.

HE cordiality of his welcome was a surprise to Mason; he could hardly tell why. The days had dragged heavily since his separation from Barbara, and his mind had been filled with doubts. The delay imposed upon him by Barbara's circumstances and then by his own was unwholesome; love long restrained from utterance is apt to make the soul sick. During his last week in Moscow he had copied court minutes and other documents into the folio records in an abstracted fashion, while the

conscious part of his intellect was debating his chance of securing Barbara's consent. He fancied that she might hold herself more than ever aloof from him now; that her pride had been too deeply wounded to recover, and that she would never bring herself to accept him.

When he had at length finished all there was for him to do in the clerk's office at Moscow, and Magill had contrived to borrow enough money to pay him his fifty cents a day, Mason was too impatient to wait for some wagon bound for the Timber Creek neighborhood. He started on foot, intending to pass the night under the friendly roof of the Graysons, and to push on homeward in the morning; for he would already be a month late in beginning his college year. His mind was revolving the plan of his campaign against Barbara's pride

all the way over the great lonely level prairie, the vista of which stretched away to the west until it was interrupted by a column of ominous black smoke, which told of the beginning of the autumnal prairie fires that annually sweep the great grassy plains and keep them free of trees. At length the tantalizing forest, so long in sight, was reached, and he entered the pale fringe of slender poplar-trees—that forlorn hope thrown out by the forest in its perpetual attempt to encroach on the prairie annually fire-swept. But when at last he entered the greater forest itself, now half denuded of its shade, the problem was still before him. He contrived with much travail of mind what seemed to him an ingenious device for overcoming Barbara's fear of his family. He would propose that his mother should write her a letter giving a hearty assent to his proposal of marriage. If that failed, he could not think of any other plan likely to be effective.

Like many conversations planned in absence, this one did not seem so good when he had the chance to test it. The way in which Tom welcomed him at the gate, shaking his hand and taking hold of his arm in an affectionate, informal way, gave him an unexpected pleasure, though nothing could be more natural under the circumstances than Tom's gratitude. And when Tom said, "Barbara 'll be awful glad to see you, an' so 'll Mother," Mason was again surprised. Not that he knew any good reason why Barbara and her mother should not be glad to see him, but he who broods long over his feelings will hatch forebodings. When Hiram looked up from Tom at the gate, he saw Barbara's half-petite figure and piquant face, full as ever of force and aspiration, waiting half-way down the walk. Barbara paused there, half-way to the gate, but she could not wait even there; she came on down farther and met him, and looked in his eyes frankly and told him—with some reserve in her tone, it is true, but with real cordiality—that she was glad to see him. And by the time he reached the porch, Mother Grayson herself—kindly, old-fashioned soul that she was—stood in the door and greeted Mason with tears in her eyes.

After a little rest and friendly talk in the cool, well-kept, home-like sitting-room, Hiram went out with Tom to look about the familiar place. The fruit trees were pretty well stripped of their foliage by a recent wind and the ground was carpeted with brown and red and yellow leaves, while the rich autumn sunlight, which but half warmed the atmosphere, gave one an impression of transiency and of swift-impending change. It was one of those days on which the seasons are for the instant arrested—a little moment of repose and res-

pite before the inevitable catastrophe. The busiest man can hardly resist the influence of such a day; farmers are prone to bask in the slant sunlight at such times and to talk to one another over line-fences or seated on top-rails. The crows fly hither and thither in the still air, and the swallows, gathered in noisy concourse, seem reluctant to set out upon their southward journey. But Mason soon left Tom and entered the kitchen, where he sat himself down upon a bench over against the loom and watched the swift going to and fro of Barbara's nimble shuttle, and listened to the muffled pounding of the loom-comb, presently finding a way to make himself useful by winding bobbins.

The two were left alone at intervals during the afternoon, but Mason could not summon courage to reopen the question so long closed between them. His awkward reserve reacted on Barbara, and conversation between them became difficult, neither being able to account for the mood of the other.

After a while Janet, tired with following Tom the livelong day, came into the kitchen and besought Barbara to sing "that song about Dick, you know"; and though Mason did not know who Dick might be, he thought he would rather hear Barbara sing than to go on trying to keep up a flagging conversation; so he seconded Janet's request. When Barbara had tied a broken string in the "harness" of the loom, she resumed her seat on the bench and sang while she wove.

BARBARA'S WEAVING SONG.

Fly, shuttle, right merrily, merrily,
Carry the swift-running thread;
Keep time to the fancy that eagerly
Weaveth a web in my head.

For Dick he will come again, come again,
Dick he will come again home from afar
With musket and powder-horn,
Musket and powder-horn, home from the war.

Beat up the threads lustily, lustily,
Weave me a web good and strong;
Heart brimful and flowing with joyousness
Ever is bursting with song.

For Dick he will come again, etc.

Warp, hold the woof lovingly, lovingly,
Taking and holding it fast;
Hearts bound together in unity
Love with a love that will last.

For Dick he will come again, come again,
Dick he will come again home from afar
With musket and powder-horn,
Musket and powder-horn, home from the war.

By the time the ditty was ended, Mrs. Grayson was setting the supper-table by the fireplace, doing her best to honor her guest. She took down the long-handled waffle-irons and made a plate of those delicious cakes unknown

since kitchen fire-places went out, and the like of which will perhaps never be known again henceforth. She got out some of the apple-butter, of which half a barrel had been made so toilsomely but the week before, and this she flanked with a dish of her peach preserves, kept sacredly for days of state. The "chaney" cups and saucers were also set out in honor of Hiram, and the almost transparent preserved peaches were eaten with country cream, from saucers thin enough to show an opalescent translucency, and decorated with a gilt band and delicate little flowers. This china, which had survived the long wagon-journey from Maryland, was not often trusted upon the table.

"My! What a nice supper we've got, Aunt Marthy!" said Janet, clapping her hands, as they took their seats at the table.

"It seems to me you're making company out of me," said Mason, in a tone of protest.

"We sha'n't have you again soon, Mason," said Tom, "and we don't often see the like of you."

The words were spontaneous, but Tom ducked his head with a half-ashamed air when he had spoken them. Barbara liked Tom's little speech: it expressed feelings that she could not venture to utter; and it had, besides, a touch of Tom's old gayety of feeling in it.

When supper was well out of the way Hiram proposed a walk with Barbara, but it did no good. They talked mechanically about what they were not thinking about, and by the time they got back to the house Mason was becoming desperate. He must leave in the morning very early, and he had made no progress; he could not bring himself to broach the subject about which Barbara seemed so loath to speak, and concerning which he dreaded a rebuff as he dreaded death.

They entered the old kitchen and found no one there; the embers were flickering in the spacious fire-place and peopling the room with grotesque shadows and dancing lights.

"Let us sit here awhile, Barbara," he said, with a strange note of entreaty in his tone, as he swung the heavy door shut and put down the wooden latch—relic of the pioneer period.

"Just as you please, Mr. Mason," answered Barbara.

"Oh! say Hiram, won't you?" He said this with a touch of impatience.

"Hiram!" said Barbara, laughing.

He led her to the loom-bench.

"Sit there on high, as you did the night you put me into a state of misery from which I have n't escaped yet. There, put your feet

on the chair-rung, as you did that night." He spoke with peremptoriness, as he placed a chair for her feet, so that she might sit with her back to the loom. Then he drew up another shuck-bottomed chair in such a way as to sit beside and yet half facing her, but lower.

"Now," he said doggedly, "we can finish the talk we had then."

"That seems ages ago," said Barbara, dreamily; "so much has happened since."

"So long ago that you don't care to renew the subject?"

"I—" But Barbara stopped short. The feeble blaze in the fire-place suddenly went out.

Hiram did not know where to begin. He got up and took some dry chips from a basket and threw them on the slumbering coals, so as to set the flame a-going again. Then he sat down in his chair and looked up at the now silent Barbara, and tried in vain to guess her mood. But she remained silent and waited for him to take the lead.

"Do you remember what you said then?" he asked.

"No! how can I? It seems so long ago."

"You said a pack of nonsense." As he blurted out this charge Mason turned his head round obliquely, still regarding Barbara.

"Did I? That's just like me," Barbara answered, with a little laugh.

"No, it is n't like you," he replied, almost rudely. "You're the most sensible woman I ever knew, except on one subject."

"What's that?" Barbara was startled by the vehemence and abruptness of his speech, and she asked this in a half-frightened voice.

"Your pride. I looked up to you then, as I do now. You're something above me—I just worship you." To a man of maturity this sort of talk seems extravagant enough. But one must let youth paint itself as it will, with all its follies on its head. You've said sillier things than that in your time, sober reader—you know you have!

"I do just worship you, Barbara Grayson," Hiram went on; "but you talked a parcel of fool stuff that night about the superiority of my family, and about your not being able to bear it that my people should look down on you, and—well, a pack of tomfoolery; that's what it was, Barbara, and there's no use of calling it anything else."

Barbara was silent.

"Now, I'm not going to give you a chance to make any more such speeches. But I want to ask you whether, if I should send you a letter from my mother when I get home, and maybe from my sisters too, after I have told them the whole truth, urging you to accept me and become one of our family—I want to know whether, then, you would be

willing; whether you 'd take pity on a poor fellow who can't get along without you. Would that suit you?"

"No, it would n't," said Barbara, looking at the now blazing chips in the fire-place with her head bent forward.

"Well, what on earth *would*, then?" And Mason tilted back his chair in the nervousness of desperation and brought his eyes to a focus on her face, which was strangely illuminated in the flickering foot-lights from the hearth.

"Did I talk that way last summer?"

"Yes, you did."

"It must have hurt you. I can see it hurt you, from the way you speak about it."

"Yes," said Mason; "I've been in a sort of purgatory ever since."

"And I did n't mean to hurt your feelings. I'd rather do anything than to hurt your feelings." Here she paused, unable to proceed at once, but he waited for her to show the way. Presently she went on:

"Now, Mr. Mason,—Hiram, I mean,—I'm going to punish myself for my foolish pride. I must have felt very differently then to what I do now. The more I have seen of you the more I have—admired you." Barbara stopped and took up the hem of her apron and picked at the stitches as though she would ravel them. Then she proceeded, dropping her head lower, "Somehow, I hate to say it,—but I'm going to punish myself,—the more I have seen of you the more I have—*liked* you. It don't matter much to me now whether your mother likes me or not, and I really don't seem to care what your sisters think about your loving a poor girl from the country."

"Hush! Don't talk that way about yourself," said Hiram. But Barbara was so intent on finishing what she had resolved to say that she did not give any heed to him, but only went on pulling and picking at the hem of her apron.

"I only want to know one thing, Mr. Mason, and that is whether you—whether you really and truly want me?" Her face blushed deeply, she caught her breath, her head bowed lower than before, as though trying in vain to escape from Hiram's steadfast gaze.

"God only knows how I do love you, Barbara," said Hiram, speaking softly now and letting his eyes rest on the floor.

"Well," said Barbara, "as good a man as you deserves to have what he wants, you know"; and here she smiled faintly. "I'll put in the dust all the wicked pride that hurts you so." And Barbara made a little gesture. Then after a moment she began again, stammeringly, "If—if you really want me, Hiram Mason,—why—then—I'll face anything rather than miss of being yours. Now will

that do? And will you forgive me for keeping you in purgatory, as you call it, all this time?" There were tears in her eyes as she spoke; partly of penitence, perhaps, but more than half of happiness.

When she had finished, Mason got up and pushed his chair away and came and sat down on the loom-bench beside her, Barbara making room for him, as for the first time she lifted her eyes timidly to his.

"I've been a goose, Barbara, not to understand you before. What a woman you are!"

XXXII.

THE NEXT MORNING.

WHEN Tom waked up the next morning in the gray daybreak, he found that Mason, who should have shared his room, had not come to bed at all. And when Tom came down to uncover the live coals and build up the kitchen fire, he found that the embers had not been covered under the ashes as usual; there were instead smoking sticks of wood that had nearly burned in two, the ends having canted over backward outside of the andirons. The table stood in the floor set with plates and cups and saucers for two, and there were the remains of an early breakfast. There was still heat in the coffee-pot when Tom touched it, and from these signs he read the story of Barbara's betrothal to Mason; he conjectured that this interview, which was to precede a separation of many months, had been unintentionally protracted until it was near the time for Mason's departure. The débris of the farewell love-feast, eaten in the silent hour before daybreak, seemed to have associations of sentiment. Tom regarded these things and was touched and pleased, but he was also amused. This sitting the night out seemed an odd freak for a couple so tremendously serious and proper as the little sister and the schoolmaster.

An hour later, when Tom, having finished his chores, came in for his breakfast, Barbara had reappeared below stairs with an expression of countenance so demure—so entirely innocent and unconscious—that Tom could not long keep his gravity; before he had fairly begun to eat he broke into a merry, boyish laugh.

"What *are* you laughing about?" demanded Barbara, looking a little foolish and manifesting a rising irritation, that showed how well she knew the cause of his amusement.

"Oh! nothing; but why don't you eat your breakfast, Barb? You seem to have lost your appetite."

"Don't tease Barb'ry now," said Mrs. Grayson.

"I'm not teasing," said Tom; "but I declare, Barb, it must have seemed just like

going to housekeeping when you two sat down to eat breakfast by yourselves this morning."

"O Tom!" broke in Janet, who couldn't quite catch the drift of the conversation, "Barbara went to bed with her clothes on last night. When I waked up this morning she was lying on the bed by me with her dress on."

Tom now laughed in his old unrestrained fashion.

"Say, Barbara," Janet went on, "are you going to marry that Mr. Mason that was here yesterday?"

Knowing that she could not get rid of Janet's inquiries except by answering, Barbara said: "Oh, I suppose so," as she got up to set the pot of coffee back on the trivet and hide a vexation that she knew to be foolish.

"Don't you *know* whether you're going to marry him or not?" put in Janet. "I sh'd think you'd know. And I sh'd think he'd be a real nice husband." Then after a few moments of silence, Janet turned on Tom. "Tom, who's *your* sweetheart?"

"Have n't got any," said Tom.

"Is n't that purty girl that was here yesterday your sweetheart?"

"No!"

"Are n't you *ever* going to get married?"

"Maybe, some day. Not right off, though."

"I wish you would find a good wife, Tom," said Barbara, without looking from her plate. "It would cheer you up." Barbara felt a little guilty at the thought of leaving the brother who had always seemed her chief responsibility.

"Say, Tom, won't you wait for me?" said Janet, solemnly.

"Yes, that's just what I'll do," said Tom, looking at her. "I had n't thought of it before; but that's just exactly what I'll do, Janet. I'll wait for you, now you mention it."

"Will you, indeed, and double deed?"

"Yes, indeed, and deed and double deed, I'll wait for you, Janet."

"That'll be nice," said Janet, continuing her breakfast with meditative seriousness. "Now I'm your sweetheart, ain't I?"

XXXIII.

POSTSCRIPTUM.

It was in the last days of October, a few weeks after the proper close of the story which I have just related, when Henry Miller—the most matter-of-fact and unsensational of young men—threw his family into a state of excitement and supplied the gossip of the neighborhood with a fresh topic by announcing at home and abroad that he was going to leave the country, either for the

Iowa country to the west of the Mississippi, or for the fertile bottom-lands up north on the "Wisconse" River, as it was called. He was the only son of his father, and had inherited the steady, plodding industry and frugality so characteristic of a "Pennsylvania Dutch" race. Until he was of age he was bound, not only by law, but by the custom of the country, to serve his father much as a bondman or an apprentice might have served, for an able-bodied son was distinctly recognized as an available and productive possession in that day. When he became of age his close-fisted father made no new arrangement with him, offered him no start, paid him no wages, and gave him no share in the produce of the fields. It was enough, in the father's estimation, that Henry would succeed to a large part of the property at his death. But Henry, on mature reflection, had made up his mind that emigration would be better than a reversionary interest that must be postponed to the death of so robust a man as his father, who was yet in middle-life and who came of a stock remarkable for longevity. Was not his grandfather yet alive in Pennsylvania, while his great-grandfather had not been dead many years? It was after calculating the "expectation of life" in the Miller family that Henry notified his father of his intention to go where land was cheap and open a large farm for himself. In vain the father urged that he could not get on without him, and that there would be no one to look after things if the father should die. Henry persisted that he must do something for himself and that his father would have to hire a man, for he should surely leave as soon as the crops were gathered, so as to get land enough open in some frontier country to afford him a small crop of corn the first year.

Henry's mother and sisters were even more opposed to his going than his father was, and they did not hesitate to blame the senior Miller with great severity for not having "done something" for Henry. Henry's father had never before known how unpleasant a man's home may come to be. He was reminded that Henry had not an acre, nor even a colt, that he could call his own, and that other farmers had done better than that. This state of siege became presently quite intolerable, and the elder Miller resolved not only "to do something" for Henry, but to do it in such a way that his son would begin life very well provided for. He wanted to silence the clamor of the house and the neighborhood once for all, and prove to his critics how much they were mistaken.

It was about a week after Henry's first resolution was taken that he and his father were

finishing the corn-gathering. They were throwing the unshucked ears into a great wagon of the Pennsylvania pattern—a wagon painted blue, the “bed” of which rose in a great sweep at each end as though some reminiscence of the antique forms of marine architecture had affected its construction. When all the corn within easy throwing distance had been gathered, Henry, who was on the near side, would slip the reins from the standard over the fore wheel and drive forward the horses, which even in moving bit off the ends of corn ears or nibbled at the greenest-looking blades within their reach.

“Let’s put on the sideboards,” said the elder, “and we can finish the field this load.” Though Miller’s ancestors had come to this country with the Palatine immigration, away back in 1710, there was a little bit of German in his accent; he said something like “gorn” for corn. The sideboards were put up, and these were so adjusted that when they were on the wagon the inclosing sides were rendered level at the top and capable of holding nearly double the load contained without the boards.

“Henry,” said the father, when the two were picking near together and throwing corn over the tail-gate of the wagon, “if you give up goin’ away an’ git married right off, an’ settle toun here, I’m a-mine to teed you that east eighty an’ a forty of timber. Eh?”

“That’s purty good,” said Henry; “but if your deed waits till I find a wife, it may be a good while coming.”

“That eighty lays ’longside of Albaugh’s medder an’ lower gorn-field,” said the father, significantly.

“You mean if I was to marry Rache, Albaugh might give us another slice.”

“Of gourse he would; an’ I’d help you put up a house, an’ maybe I’d let you hav’ the roan golt. You’d hav’ the red heifer anyhow.”

“But I never took a shine to Rache; and if I did, I could n’t noways come in. They’s too many knocking at that door.”

“But Rachel ain’t no vool,” said the elder. “She knows a good piece of lant w’en she sees it, an’ maybe she’s got enough of voolin’ rount.”

All that afternoon Henry revolved this proposition in his mind, and he even did what he had never done before in his life—he lay awake at night. The next day, after the midday dinner, he said to himself: “I might as well resk it. Albaugh’s got an all-fired good place, and all out of debt. And that’s a tremendous nice eighty father’s offered to give me.”

So he went upstairs and put on a new suit of blue jeans fresh from his mother’s loom. Then he walked over to Albaugh’s, to find Rachel sewing on the front porch.

Rachel had been “kindah dauncey like,” as her mother expressed it, ever since her visit to Barbara. She had received as many attentions as usual, but they seemed flat and unrelishable to her now. She began seriously to reflect that a girl past twenty-three was growing old in the estimation of the country, and yet she was further than ever from being able to make a choice between the lovers that paid her court, more or less seriously.

When she looked up and saw Henry Miller coming in at the gate she felt a strange surprise. She had never before seen him in Sunday clothes or visiting on a week-day.

“Hello, Henry! Looking for Ike?” she asked, with neighborly friendliness.

“No, not as I know of. I’ve come to talk to you, Rache.”

“To me? Well, you’re the last one I’d look for to come to talk to me; and in daytime, and corn-shucking not begun yet.” There was an air of excited curiosity in her manner. It was plain to be seen that she was inwardly asking, “What *can* Henry Miller be up to, anyhow?” but to him she said, “Come in, Henry, an’ take a cheer.”

“No, I’ll sed down here,” he answered, taking a seat on the edge of the porch, like the outdoor man that he was, approaching a house with half reluctance.

The relations between Henry and Rachel were unconstrained. They had played “hide and whoop” together in childhood, and times innumerable they had gone on blackberrying and other excursions together; he had swung her on long grape-vine swings on the hill-side; they had trudged to and from school in each other’s company, exchanging sweet-cakes from their lunch-baskets, and yet they had never been lovers.

“Rache,” he said, locking his broad, brown hands over his knee, “father says he’ll give me that east-eighty whenever I get married, if I won’t go off West.”

“You’ll be a good while getting married, Henry. You never was a hand to go after the girls.”

“No, but I might chance to get married shortly, for all that. The boys that do a good deal of sparking and the girls that have a lot of beaux don’t always get married first. You’d ought to know that, Rache, by your own experience.”

Rachel laughed good-naturedly, and waited with curiosity to discover what all this was leading up to.

“What I’m thinking,” said Henry, with the

air of a man approaching a horse-trade cautiously, lest he should make a false step, "is this: that eighty of our'n jines onto your medder and west corn-field."

"Do you want to sell it?" said Rachel. "You might see father; he'd like to have it, I expect."

"Can't you guess what it is that I'm coming at?"

"No, I *can't*," said Rachel; "not to save my life."

"Looky here, Rache," and Henry gave his shoulders a twitch, "the two farms jine; now, what if you and me was to jine?"

"Well, Henry Miller, if you don't beat the Dutch! I never heard the like of that in all my born days!" Rachel had heard many propositions of marriage, but this sort of love-making, with eighty acres of prairie land for a buffer, was a novelty to her.

"Looky here, Rache," he said, in a tone of protest, "I've knew you ever since you was knee-high to a grasshopper. Now, what's the use of fooling and nonsense betwixt you and me? You know what I am — a good, stiddy-going, hard-working farmer, shore to get my sheer of what's to be had in the world without scrouging anybody else. And I know just exactly what you air. We've always got along mighty well together, and if I have n't ever made a fool of myself about your face, w'y, so much the better for me. Now, whaddy yeh say? Let's make it a bargain."

"W'y, Henry Miller, what a way oftalking!"

"Rache, come, go along with me and see where'bouts I'm going to put up a house. Father's promised to help me. It's down by the spring, just beyand your medder fence. Will you go along down?"

"Well, I don't care if I do go down with you, Henry. But it's awful funny to come to such a subject in that way."

Rachel put on her sun-bonnet, and they went through the orchard together.

"We could put up a nice house there. Father's willing to throw in a forty of timber too — the forty that joins this eighty over yander. We'd be well fixed up to begin, no matter what your father done or did n't do for us. Whaddy you think of the plan?"

"You — you have n't said you loved me, or anything," said Rachel, piqued at having her charms quite left out of the account. But she could not hide from herself that Henry's proposition had substantial advantages. She only added, "What a curious man you are!"

"Don't you believe I'd make a good husband?"

"Yes, of course you would."

"And a good provider?"

"Yes, I'm shore of that."

"Well, now, I'm not going to pretend I'm soft on you. If you say 'No,' well and good; there's an end. I sha'n't worry myself into consumption. You've got a right to do as you please. I'm not going to have folks say that I'm another of the fools that's broke their hearts over Rache Albaugh. Once you're mine, I'll set my heart on you fast enough. But I never set my heart on anything I might n't be able to get."

Rachel did not say anything to this bit of philosophy. She had in the last two weeks recognized the advisability of her getting married as soon as she could settle herself. But on taking an inventory of her present stock of beaux, she had mentally rejected them all. They were prospectively an unprosperous lot, and Rachel was too mature to marry adversity for the sake of sentiment. She found herself able to listen to Henry Miller's cool-blooded proposition with rather more tolerance than she felt when hearing the kind of love-talk she had been used to. Why not get her father to do as well by her as the Millers would by Henry, or to do better, seeing he was the richer and had but two children? Then they might begin life with plenty of acres and a good stock of butter cows.

Henry showed her where they could put their house, where the barn would be placed, and where they would have a garden. Rachel felt a certain pleasure in fancying herself the mistress of such a place. But it was contrary to all the precedents laid down in the few romances she had read for a woman to marry a man who was not her "slave": that was the word the old romancers took delight in. She tried to coquet with Henry, in order to draw from him some sort of professions of love. A flirtation with a lay figure would have been quite as successful. He was plain prose, and she presently saw that if she accepted him it must be done in prose. She could n't help liking his very prose; she was a little tired of slaves; it seemed, on the whole, better to have a man at least capable of being master of himself.

In much the same tone — the tone of a man buying, or selling, or proposing a co-partnership for business purposes — Henry Miller carried on the conversation all the way back until they reached the corn-crib, where he came to a stand-still.

"Whaddy yeh say, Rachel? Is it a bargain?"

"Well, Henry, it's sudden like. I want to take time to think it over."

"Then I'll take back the offer and put out for the Ioway country. I'm not a-going to have my skelp a-hanging to your belt for days and days, like the rest of them. What's

the use of thinking? You don't want to take Magill, do you?"

"He's too old, and his nose is rather red," laughed Rachel.

"Nor Tom Grayson, I suppose?" Henry mentioned Tom as the second because he was the one about whom he had misgivings.

"I give him the sack before the shooting, and I'm not going to go back to him now."

Rachel faltered a little in this reply, but she spoke with that resolute insincerity for which women hold an indulgence in advance when their hearts are being searched.

"Well," said Henry, "if you think you can do better by waiting, I'm off. If you think I'm about as good a man as you're likely to pick up, here's your chance. It's going, going, gone with me. Either I marry you and take father's offer, or I put out for the Iowa country. I don't ask you to think I'm perfection, but just to take a sober, common-sense look at things."

Rachel saw that it was of no use to expect

Henry to court her, and she could not help liking him the better for his honest straightforwardness. She looked down a minute, in the hope that he would say something that might make it easier for her to answer, but he kept his silence.

"Henry," she said at length, rolling a corn-cob over and over under the toe of her shoe, "I've got a good mind to say 'Yes.' You don't make me sick, like the rest of them. Father'll be struck when he hears of it. He's always said I'd marry some good-for-nothing town-fellow."

"Is it a bargain, good and fast?" said Henry, holding out his hand, as he would have done to clinch the buying of a piece of timber land or a sorrel horse.

"Yes," said Rachel, laughing at the oddness of it and the suddenness of it, "I'm tired of fooling. It's a bargain, Henry."

"Good fer you, Rache! Now I begin to like you better than ever."

THE END.

Edward Eggleston.

A MEXICAN CAMPAIGN.

BY THOMAS A. JANVIER, AUTHOR OF THE IVORY BLACK STORIES.

IN THREE PARTS. PART I.

THE MOBILIZATION OF THE TROOPS.

MR. PEMBERTON LOGAN SMITH was a member of the Philadelphia Sketch Club; and by his associates in that eminently democratic organization it generally was conceded that if he had not been handicapped by the first two-thirds of his name, and if he had not been born constitutionally lazy, he probably would have made rather a shining light of himself as a landscape painter.

When this opinion was advanced in his presence, as it very frequently was, Pem usually laughed in his easy-going way and said that quite possibly it possessed some of the elements of truth. For Mr. Pemberton Logan Smith knew very well that he was constitutionally lazy, and he as frankly gloried in his double-barreled Philadelphia name as he did in the fact that he was a Philadelphian to the backbone.

"You see, old man," he once explained to his New York friend, the eminent young

figure-painter Vandyke Brown, "you New York people have n't much notion of birth, and family connection, and that sort of thing, anyway. There are, I believe," said Pem, airily, "a few good families in New York, but most of your so-called best people have n't the least notion in the world who their grandfathers were; or else—and this amounts to the same thing—they know so much about them that they want to keep them as dark as possible. All you care for over here is money. Now that is n't our way at all. Of course we don't object to a man's having money; but the first thing we want him to have is birth. If he can show that his people came over with Penn,—or before Penn, as mine did,—and if he belongs to the Assembly, and is certain of his invitation to the Charity Ball, and a few things of that sort, we take him in; but if he has n't this sort of a record—well, we think about it. Of course, now and then a fellow who has only money works his way into good society, provided he knows how to give a really good dinner and does n't stint the terrapin. But these are the exceptions; the rule is the other way."

But while Brown and some of the Sketch Club men regretted that Pem did not buckle down to painting and accomplish some of the good work that he undoubtedly was capable of, Pem himself took the matter very easily. He had succeeded in developing enough energy to paint two or three pictures which deserved the praise that they received, and with this much accomplished he seemed to be quite contented to let his case rest.

In the Social Art Club, where the artistic element was infinitesimal, and where Pem's social high qualifications were accepted at their proper high value, he was regarded as an artistic genius of considerable magnitude. But this was only natural, for he really knew something about pictures — instead of only partly knowing how to talk about them.

And in both of his clubs, and pretty generally by his somewhat extensive personal acquaintance, Pem was set down — quite apart from his qualifications as an artist — as a thoroughly good fellow. As a rule a popular verdict of this nature may be critically examined without being reversed. In certain quarters the fact was recognized that he had been a little narrowed by the circumstances of his birth and environment ; but even in these quarters it was admitted that there was something very pleasant about him — when he was not shying cocoa-nuts from the heights of his Philadelphia family tree. And finally the three or four people who really knew him well, among whom was his friend Brown, believed that there was an underlying strength and earnestness in his character which would be aroused, and so fully as to become the governing force of his life should any great joy or great calamity overtake him that would stir his nature to its depths.

A good-looking young fellow of five or six and twenty, with pleasant manners, plenty of money, a faculty for taking odd and amusing views of life, and having at least a spark of genius in his composition — a young fellow of this sort, I say, is not to be met with on every street corner; and when he is encountered, commonplace humanity, without precisely knowing why, rejoices in him; and uncommonplace humanity, knowing precisely why, rejoices in him too.

On the whole, therefore, it was very natural, when the Browns were casting about them for an eligible man to whom to offer the tenth section in the car that they had chartered for their Mexican expedition, that Mr. Pemberton Logan Smith should have been accorded the suffrages of the Mexican expeditioners with a flattering unanimity. Quite as naturally, when this offer to join what promised to be an exceptionally pleasant party in an exceptionally

pleasant undertaking was made known to him, Mr. Pemberton Logan Smith promptly accepted it. And he was the more disposed to Mexican adventure because he had acquired a very satisfactory command of Spanish in the course of a recently passed delightful year in Spain.

The projector of the Mexican campaign was Mr. Mangan Brown. Through his leather connection in Boston, Mr. Brown had been induced to invest a considerable sum of money in what his Boston friends had described to him, at the time when the investment was made, as the highly philanthropic and very lucrative work of aiding in the railway development of Mexico. A fabulously rich country was waiting, they told him, to be aroused into active commercial life by the provision of adequate means of internal transportation; a sister Republic, they added, was pining to be bound to the great nation of the north by bonds of steel. Honor awaited the men who would accomplish this magnificent international work, while the substantial return for their philanthropy would be unlimited dividends in hard cash. It was a picturesque way of presenting a commercial enterprise, and Mr. Brown was moved by it. Pleased with the prospect of figuring to future generations in the guise of a continental benefactor, and not averse to receiving unlimited dividends, which would be all the more acceptable because they were so honorably earned, he listened to the voice of the Boston charmers — and drew his check in his customary liberal way.

His desire to go to Mexico, in part at least, grew out of his not altogether unnatural wish to find out why some of the promised generous dividends had not been declared. But aside from his financial interest in the sister republic, the erratic visitation of Miss Violet Carmine — now Mrs. Rowney Mauve — had inspired him with a strong curiosity to visit a country that was capable of producing so extraordinary a type of womanhood. And point had been given to this curiosity by the frequent warm invitations extended to him by his remote kinsman, Violet's father, to come to Mexico for a visit of indefinite length, accompanied by his family and a working majority of his friends. Hospitality of so boundless a type, Mr. Brown considered, in itself was a phase of sociology the study of which very well was worth a journey of three thousand miles.

And finally, with an eye to business, Mr. Brown believed that a visit to Mexico might be made to redound very materially to his interest in the matter of the direct importation of Mexican hides.

"The leather business is not what it used

to be, Van," he remarked somewhat gloomily to his nephew, when this feature of the expedition was touched upon. "When I was a young man, serving my time with the late Mr. Orpiment's father, there were chances in leather that nowadays nobody would even dream of. I remember, in '46, our firm brought in two shiploads of hides from Buenos Ayres, which were worth almost their weight in gold. They were made right up into shoes for Scott's army, you see. It always has rested a little heavily on my conscience, Van, that those hides were made up green that way. The shoes that they made of them must have worn out, I should say, in rather less than a week. But I was n't really responsible for it, for I was only a boy in the counting-room; and even Mr. Orpiment was n't responsible for what was done with the hides after they were sold. And our firm certainly made a pot of money out of the transaction. Of course, I can't hope now for anything as good as that was, no matter what I find in Mexico; but I am sure, all the same, that the Mexican leather market is worth looking into — and if all the Mexicans are like our cousin Carmine, they must be worth looking into also.

"By the way, I had a letter from Carmine to-day — he writes extraordinary English — in answer to mine telling him when we are likely to get there; and instead of being horrified at the prospect of having such a lot of us bowling down on him, as I should be, I know, he says that his only regret is that there are not more of us coming. You'd think that being called upon this way to entertain twelve people, with only one in the whole party that he ever has laid eyes on, and, besides Violet, only four — you and I, Verona and your aunt Caledonia — that have the smallest claim of blood relationship, would upset even a Mexican's extended notions of hospitality. But it does n't a bit. He writes in the friendliest way that he is looking forward with delight to having us all with him for three or four months anyway, and urges us to hurry down as quickly as possible.

"I confess, Van," Mr. Brown went on self-reproachfully, "that this whole-souled sort of welcome makes me feel a little mean about the half-hearted way in which we welcomed Violet. And I really am ashamed to remember how thankful I was when she ran off with your friend Rowney Mauve and got married. To be sure, Violet would n't have been such a — such an abnormity, if it had n't been for that confounded parrot. Thank Heaven, she has consented to leave the parrot at home this time. I don't think that I could have gone myself if Violet had insisted, as at first she seemed disposed to, upon taking along that

detestable bird. Parrots — parrots are awful things, Van!" And Mr. Brown obviously permitted his thoughts to wander back ruefully into a parrot-stricken past.

As to the party at large, it may be said — with the exception of Mr. Pemberton Logan Smith — to have organized itself. Van and Rose, Verona and young Orpiment, Mr. and Mrs. Gamboge, were so closely bound by blood, marriage, and friendship to each other and to Mr. Mangan Brown that they were as much a part of his plan as he was himself. Rowney Mauve and Violet, the son-in-law and the daughter of their prospective host in Mexico, naturally could not be left out. That Jaune d'Antimoine and his wife Rose (*née* Carthame) should come along was taken for granted by everybody. Indeed, these young French people were very close to the hearts of their American friends, and leaving them out of any plan as pleasant as this Mexican plan promised to be was not to be thought of.

Jaune, by the way, had made a great success in art since that day when Mr. Badger Brush had given him his first order. To be sure, as an animal-painter he could not hope to do work that would rank with Van's figure-painting; but he considered himself, and his wife considered him, as ranking far above young Orpiment. In this opinion, very naturally, neither young Orpiment nor Verona concurred. As to Verona, she entertained the profound conviction that landscape-painting was the very crown and glory of all forms of artistic expression; and she not less firmly believed that her husband was the highest exponent of that highest form of art. There was a little "Evening on the Hills" that young Orpiment had painted, while they were on their wedding journey in the Catskills, that Verona never permitted him to sell, and that she was accustomed to compare — to her husband's advantage — with the finer work of Claude. It will be observed that some years of married life had not in the least degree diminished — it could not well have augmented — the strength of Verona's wifely affection.

The party thus constituted comfortably filled, with one section to spare, the Pullman car that Mr. Mangan Brown, who cared a great deal for comfort and very little for expense, had chartered for the expedition. Mr. and Mrs. Gamboge, out of respect to their superior age, and because of the need for superior privacy involved in the commercial peculiarity of Mrs. Gamboge's back hair, were accorded the cranny that the Pullman people dignify with the name of a "drawing-room"; and each of the other members of the party had a section apiece.

There was some little debate as to what

should be done with the spare section; for they all were agreed that another nice person would be welcome; and equally agreed that it would be a pity, in the interest of nice persons abstractly, to leave vacant a place that so many people very gladly would fill. The suggestion made by Rose to Van, somewhat timidly, it must be confessed, that old Madder should be invited, never came before the house at all. It was voted down promptly in committee. Van had a great deal of theoretical devotion to his father-in-law, but he did not see his way clear to this form of its practical expression. With a wise diplomacy, however, he refrained from making the matter personal. After Rose was married old Madder had taken a little apartment, and his sister kept house for him. It was here that little Madder and Caledonia were to remain while Rose and Van were in Mexico. What would become of the children, Brown asked, if their grandfather went away? And this, of course, settled it.

A similar suggestion, similarly made in private by his wife to Jaune d'Antimoine, in regard to Madame Carthame, similarly received a firm though less skillful negative.

Old Madder probably never knew that his name had been mentioned in connection with the Mexican expedition at all; and the diplomatic Madame d'Antimoine certainly did not permit her severe maternal relative to imagine for a moment that she had been weighed in her son-in-law's balance and found wanting. But after the party had started, old Madder certainly did say to Cremnitz White and Robert Lake, and one or two more of his especial cronies, that nothing under heaven could have induced him to accompany to Mexico, or to any other part of the world, a gang of painters that had n't a single artist among them. And Madame Carthame likewise remarked, addressing her first-floor lodger, that she would not under any circumstances have permitted herself to associate with these her daughter's friends among the *nouveaux riches*.

It really looked as though the odd section in the Pullman would remain vacant—or that it would be utilized only, as Rose suggested, as a cattery. Rose was very fond of cats, and to her mind the suggestion seemed to be a very reasonable one; for she wanted greatly to take her Persian cat, Beaux-yeux, along.

However, the feline member was not added to the party, for at this stage of proceedings Van put a large spoke in the wheel of his Philadelphia friend's fate by suggesting Mr. Pemberton Logan Smith as an eminently fit person to fill the vacancy. And so the organization of the friendly army of invasion was made complete.

THE ENGAGEMENT AT THE FRONTIER.

MRS. GAMBOGE approached the Mexican border with a heavy heart.

"Are the—the custom-house examinations *very* strict?" she asked of Mr. Gamboge, as they waited at the station in El Paso for the train that was to back across from the Mexican side of the river and hook on their car.

There was something in the tone of the lady's voice that caused her husband to look at her sharply, and to observe with some asperity, "You're not trying to smuggle anything, I hope?"

"N—no," responded Mrs. Gamboge, with a manifest hesitation. "But it—it's so horrid to have one's things all pulled to pieces, you know."

"You've got to make the best of it. You'd have done better if you'd taken my advice and not brought along such a lot of things to pull," replied Mr. Gamboge, unfeelingly. "What possible use you can have for two big trunks on a trip of this sort I'm sure I can't imagine."

Mrs. Gamboge did not respond to this unkind remark. She retired at first into a pained and dignified silence, and then into the privacy of the so-called drawing-room. A few minutes later, when Mr. Gamboge—who was a most amiable little round man—followed her to this their joint apartment to make amends for his mild severity, he found the door locked; nor would Mrs. Gamboge for some moments suffer him to enter. When she emerged from her retreat there was an expression of anxiety upon her usually placid face; and until the custom-house examination was ended—which was in a very few minutes, for the customs officials were refreshingly perfunctory in their methods—it was evident that there was a weight upon her mind.

As the train moved away southward from Paso del Norte, Mr. Gamboge went into the "drawing-room" for his cigar-case, and was startled as he entered the apartment by a little shriek of alarm.

"Oh! I thought I'd locked the door," said Mrs. Gamboge, speaking with some confusion, and at the same time hastily throwing a shawl over a cage-like structure that was lying on the seat. "Do go out, dear. You can come back in a moment."

"Caledonia," said Mr. Gamboge, seriously, "I hope that you have not really been smuggling. Let me see what you have under that shawl."

"I have n't been smuggling. Indeed I have n't—at least nothing that I have n't a perfect right to. Do go away—only for a moment, but do go away."

All this was so out of keeping with the character of his wife—who, excepting in regard to the purely conventional secret of the commercial genesis of her back hair, never had made even an approach towards having a secret from him—that Mr. Gamboge was seriously discomposd.

"Indeed, my dear, you must let me see what you are hiding," he said, at the same time making a step forward and extending his hand towards the shawl.

"Oh, don't! don't, I beg you!" Mrs. Gamboge implored, fairly wringing her plump little white hands. "It's—it's only my—my bustle. I've been taking it off."

"A bustle!" replied Mr. Gamboge with both scorn and indignation. "Bustles are absurdities and monstrosities, and you very well may be ashamed of having anything to do with them. But as you have to my certain knowledge abandoned yourself to this species of deformity for several years past, and never have even remotely hinted that you wanted to make a mystery of your folly, I am at a loss to understand why you want to make a mystery of it now. Come, my dear, you must let me see what you have hidden here. I don't want to hurt your feelings, Caledonia, but indeed I must look." And speaking this firmly, Mr. Gamboge gently disengaged himself from his wife's restraining arms and lifted the shawl.

"It is a bustle, sure enough," he said with some confusion. "But what's this inside of it?" he added in a different tone, as he perceived in the interior of the structure a carefully tied up little package of some apparently soft substance. Mrs. Gamboge made no reply. She was seated upon the sofa, gently sobbing.

"Why, Caledonia," cried Mr. Gamboge in astonishment, as he unwrapped the parcel, "it's your back hair! And yet you have your hair on, just as usual. I—I am very sorry, Caledonia," he went on humbly, being overcome by the conviction that he had contrived at one and the same time to make a fool and a brute of himself. "Indeed, indeed, dear, I had n't the least notion in the world what it was; I had n't, upon my word. Will you—will you forgive me, Caledonia?" Mr. Gamboge seated himself on the little sofa, placed his arm about his wife's plump waist, and gently drew her towards him. He was very contrite.

Mrs. Gamboge, however, resisted his advances. "Go away," she said between her sobs. "Go away! After all these years that you have been so good to me I never thought that you would do a thing like this. Now go and smoke your cigar. Of course, after a while, I shall get over it, but you had better leave me now."

Mr. Gamboge, however, being truly peni-

tent, was not to be thus repulsed. "I have been very rude," he said, "and, without meaning to be, very unkind. But I beg of you, Caledonia, to forgive me. You know how I love you, and you know that I would love you just as much if you were absolutely bald—which you are not, nor anything like it,"

Mr. Gamboge hastened to add, perceiving that the expression of his affection in these terms was unfortunate. "Your front hair is quite thick, positively thick, and that is the important place to have hair, after all." He spoke with more assurance, feeling that he was getting upon firmer ground. "So won't you try to forgive me, Caledonia; won't you try, dear?"

"Will you solemnly, solemnly promise," asked Mrs. Gamboge, still sobbing gently, but nestling her head a little closer on his shoulder as she spoke, "never to say a word about what has happened? I know that you won't speak about it to anybody else; but will you promise, on your sacred word of honor, never to speak about it again to me?"

Mr. Gamboge gave the desired pledge, and so peace was restored.

"I was so—so afraid that the custom-house man might find it, you see," Mrs. Gamboge explained a little later, as she still sat, with her husband's arm around her, on the sofa. "I would n't perhaps have minded the custom man," she continued, "nor even Verona, and not much Rose; but I could n't bear the thought that that French young woman, Mrs. d'Antimoine, you know, should see it, for I know how Violet and she would have laughed."

And then she added, "It's—it's my spare hair, you know. Don't you think that I did right to bring my spare hair along, dear?"

Mr. Gamboge kissed her, and said that he thought she did.

THE PARLEY UNDER FALSE COLORS.

THAT Mrs. Gamboge was a trifle melancholy during the day following her entry into Mexico cannot be denied; but her gloom was of a gentle, unobtrusive sort, and by no means affected the general high spirits of the party at large.

Violet Mauve, to be sure, was disposed to consider herself personally injured by her arrival at El Paso without having had the opportunity to enjoy the enlivening experience of a train robbery in Texas. Her earnest desire had been to come down to Vera Cruz in Rowney's yacht and join the expedition in the City of Mexico; for she was convinced that Lafitte still sailed the Gulf, and it was the highest ambition of her life to be captured by a real pirate. Rowney's diplomatic suggestion

that their train was pretty certain to be held up and robbed by Texan desperadoes alone had reconciled her to making the journey by rail; and as this pleasant possibility had not been realized she felt herself to be a person whose rights, as a lover of spirited adventure, had been trampled upon.

"Don't you think that Rowney has treated me very badly, Mr. Smith?" she asked with a good deal of indignation, when the safe arrival of the party in El Paso had made further chances for encounters with desperadoes impossible. "He as good as promised me that we should have a train robbery,—and I always have so wanted to be in one,—and for all that we have had in the way of adventure, excepting the horrible risks of our lives at the railway restaurants, we might as well have been spending our time in riding backward and forward between Philadelphia and New York. Oh, how I wish now I'd insisted upon coming down in the yacht! Meeting a pirate in a long black schooner, with a black flag and a skull and crossbones and a desperately wicked crew, would have been so delightful! Don't you think so? And don't you think that I have been very badly used indeed?"

"Well, in the matter of train-robbers and pirates, Mrs. Mauve, I can't say that I have had enough personal experience to justify me in venturing on a very positive opinion, though I've no doubt they are great fun, just as you say. But as a Philadelphian I do know about eating,"—Pem spoke with much feeling,—“and I must say that on that score I think that you and all the rest of us have been treated abominably. It is not so much that the food is so wretched at these railway places, you know—for at some of them it really was n't; but it's this horrible fashion the railway people have of treating their passengers as though they were locomotives—things that food and drink can be shoveled into and pumped into at the end of a section with a rush. But even a locomotive, I fancy,” said Pem, gloomily, “would resent having all the coal and water that is to keep it going for the next six hours poked under and into its boiler in twenty minutes; and that's just what happens to the passengers, you know. I assure you, Mrs. Mauve, I have n't had the faintest approach to a comfortable meal since we left the Missouri River; and I know that I have made a long start towards ruining my digestion for the rest of my life.

“Of course the railway officials themselves must feed in this shocking way when they're traveling on their own trains. Now I wonder,” continued Pem, meditatively, “I wonder what a railway official is like? Do you suppose, Mrs. Mauve, that he has an inside, you know,

like ordinary people; or that he is some form of highly specialized life from which environment, and selection, and that sort of thing has eliminated the digestive function altogether? I wish Darwin was n't dead; I'd write and ask him.”

Violet, whose knowledge of the doctrine of evolution was somewhat limited, was rather mystified by the turn that Pem had given to the conversation; but she accepted his suggestions in good part, and, seeing her way clear to answering a portion, at least, of his utterance, asked him, with a very fair show of sympathy, if his friend had been dead long.

Violet did not always quite understand what Pem was talking about; but she recognized the fact that he was a good deal of a piece, in his lazy, easy-going, queer ways, with her own husband, and she liked him accordingly. Indeed, the disposition of the entire party towards its Philadelphia member was of the friendliest sort. In speaking of his great-great-uncle, a distinguished Philadelphian of the past century, he had pleased and interested Mr. Mangan Brown by stating that this gentleman had been extensively engaged in the leather business. He had won the heart of Mrs. Gamboge by telling her—shortly after Mr. Gamboge had been giving one of his rather frequent funny little exhibitions of extreme vacillation of purpose—that he greatly admired her husband because of his firmness of character. He commended himself to Mr. Gamboge by the thorough soundness of his rather old-fashioned views upon dinners. The young women of the party liked him because he had the knack of doing and saying just the right things at the right time; of never being in the way, and of always being amusing. And the young men liked him because he could talk shop with them intelligently, and took a lively interest—since the work was to be done by somebody else—in their several artistic projects. In short, Pem found himself, as he was in the habit of finding himself, a general favorite.

“What a pity it is, Van,” Rose observed to her husband in the privacy of their chamber in the little Hotel Central in Aguas Calientes, “that your friend Mr. Smith does not get married. I'm sure that he has the making of a very good husband. Of course he would n't be a husband like you, dear, and his wife could n't expect to be as happy as I am with you. But for just the ordinary sort of husband I'm sure that he'd be much better than the average.”

“He'd be obliged to you if he heard that somewhat qualified expression of approval.”

“Yes, I suppose he would,” Rose answered in good faith. “But I think that he quite de-

serves it, for I believe that he would make a very good husband indeed. And do you know, Van," she continued presently, "I think that there are a great many happy marriages in the world. I mean," she added, by way of making the matter quite clear, "marriages which are happy when they seem as if they certainly must n't be."

Van looked a little puzzled.

"Now you know those people we have noticed sitting opposite to us in the restaurant: the nice little Mexican woman, you know, and the German-looking man in black with the big nose?"

"The man like an underdone undertaker, who drinks beer, and who never opens his mouth except to give an order to the waiter? You don't mean to say that that is a happy marriage, do you, Rose?"

"Indeed I do, and it was because I was thinking about those people that I said that a great many marriages which did n't seem happy really were. She is a dear little woman, Van, and her life has been a regular romance. She has had such heavy sorrows; and now everything has come right, and she is as happy as the day is long."

"Why, what do you know about her, child? Has she been telling you her life's history?"

"That's just what I'm coming to. It is so interesting—just like a heroine in an old-fashioned novel. This morning—while you were gone to look at those horrid dead, dried-up monks, you know—I wanted Luciano to bring me some drinking-water. I never shall get used to having chambermen instead of chambermaids, Van: I quite agree with Aunt Caledonia—I think it's horrid. Well, I went out into the gallery and clapped my hands, and when Luciano came I said *agua*, and then I pointed to my mouth. And he said something in Spanish, and pointed to the full water-bottle on the wash-stand. 'But I want fresh water, cool water,' I said. And Luciano did not understand at all, and only grinned at me. And just then that dear little Mrs. Heintzbach came out of her room and said in such nice English—she's lived part of her life in California, she told me—that I needed a little help. And then she made Luciano understand what I wanted. So, of course, we got into talk then, and I invited her into our room, and she came, and she was so ladylike and so sweet that we got to be friends almost immediately."

"What! you made friends with that woman in that off-hand way!" Van seemed to be a good deal horrified, and he also seemed to be inclined to burst out laughing.

"I must say that I don't see what there was very remarkable about it," Rose responded,

with some dignity. "She is a very charming woman, and not a 'that woman' sort of person at all. She belongs to very nice people, I'm sure."

"Yes, I'm sure she does too—on her husband's side, especially," Van answered, with a chuckle. "Go on, Rosey; I'm immensely interested."

"It's about her husband that I was going to tell you. For all his silent, grave way, he is a delightful man, Van; as good and as kind as he can be. You see, when Mrs. Heintzbach was a young girl, a mere child of sixteen, her father and mother made her marry a horrid, rich Mexican, a friend of theirs, old enough to be her grandfather. He led her a perfectly shocking life. His jealousy was terrible! Why, he would n't even let her look out of a window on the street. He had all the front windows of their house bricked up, and never let her stir outside of the front door unless he went along with her. She told me, with tears in her eyes, that she knew that it was very wicked, but she could n't help being so glad when he died that she wanted to dance! It was pretty horrible, when you come to think of it, to want to dance because your husband is dead; but, really, considering what sort of husband he was, I don't know that I can blame her."

"And then she married the gam—Mr. Heintzbach, I mean?"

"Yes—at least in a little while. She met him soon after her husband's death. And she had a chance to get to know him then because she was a widow and it was all right for her to see him alone and talk with him comfortably. I never shall get used to the way women are treated here, Van; young girls kept perfect prisoners, and only married women and widows and very old maids given the least bit of freedom. It's shocking."

"Well, she saw a good deal of him, and she liked him from the first; and of course he liked her. And so, as soon as he decently could, he told her that he loved her; and the end of it was that in less than a year they were married. And he has made her such a good husband, Van! He is so loving and trustful and affectionate, so unlike her first husband, she says."

Brown was chuckling softly. "Did she say anything about her husband's business?" he asked.

"No, not directly. She spoke about his going every evening to the bank, I remember. But it can't be managed like our banks," Rose added reflectively; "for our banks are not open in the evening, are they?"

Brown continued to chuckle. "Some of them are," he answered.

"And she spoke about his being kept out very late—till 2 or 3 o'clock in the morning. That is n't like our banks, I'm sure. And they are traveling almost constantly. She says that there is not a large city in Mexico that she has not visited with her husband. Her own home is in Guanajuato, and she has promised to give us letters of introduction to her people there; they must be very important people, from the way she spoke about them. Won't it be nice, Van, to have letters to the best people in Guanajuato? I thanked her ever so much; and I asked her to come and see us when she is in New York, and she said she certainly would. And early to-morrow morning, after she comes back from church,—she is a very religious woman, and goes to church every morning, she says,—we are to take a walk together in the little San Márcos park. She is very lonely in the early morning, she says, for her husband never gets up till 10 o'clock. Are n't you pleased, Van, that all by myself I have made such a pleasant friend?"

Brown was silent for a moment or two, and then startled his wife by exclaiming: "Well, by Jove! Rosey, you have excelled yourself! You've picked up some queer friends at one time and another, but I never thought you'd ring in this way with the wife of a Dutch gambler!"

Rose sprang up with a little gasp. "Van! What do you mean?" she cried.

But her husband, instead of answering her, burst into such fits of laughter that he fairly held his sides. "Oh, what a commentary on all the tracts of the Tract Society," he said at last, speaking with difficulty. "Upon my word, I'll write a tract myself and call it, 'The Mexican Gambler's Wife; or, The Happy Home'—the gambler a model of all the domestic virtues, you know, and his wife a shining example of simple, unostentatious piety! O Rosey! Rosey! what a treasure-house of unexpected delights you are!" And Brown threw himself on one of the little beds and laughed until the tears rolled from his eyes.

"When you are *quite* done laughing, Van," said Rose with severity, but at the same time with a decidedly frightened look, "will you please tell me just what you mean? I know, of course, that this good Mr. Heintzbach is not a gambler; but he may be something—something perhaps a little queer. Oh, have I done anything *very* silly, Van?" And Rose manifested symptoms of collapse, which were intensified as her husband enfolded her in his arms.

"It is as true as gospel, Rose," said Van, still laughing gently. "Your friend's husband is

a gambler, and no mistake. His visits to the principal cities of Mexico are strictly professional. He has come to Aguas Calientes for the fair, and just at present he is the dealer at the table here in the hotel; that's the 'bank' he goes to every evening and stays at until 3 o'clock the next morning. And I don't doubt that every word his wife said about his domestic virtues was the literal truth. In his way Mr. Heintzbach is a person of the utmost respectability; but—but perhaps when you see your friend again you might say something about our return to New York being a little uncertain; and I don't think I'd say anything more about their visiting us, if I were you. If Mr. Heintzbach were on Wall street, now, it would be all right; but as his game is n't in stocks, it might be as well—yes, I'm sure, quite as well—for us to fight a little shy of him. But oh, Rose, my angel, what a delightful thing this is that you have done! And what a perfect howl there will be to-morrow when I tell how you and the gambler's wife have become sworn friends!"

"Van!" cried Rose, springing away from him and facing him with every sign of energy and determination, "if you ever breathe so much as the first syllable of this to anybody I'll—I'll drown myself!"

"No, don't drown yourself, Rose. Think how dragged you'd look. Do it, if you really think you must do it, in some way that will be becoming. Why, my poor little girl!"—Rose was beginning to sob,— "it's wicked to laugh at you," and Brown succeeded by an heroic effort in mastering another outburst. "After all, it was a natural enough sort of thing to do; and nothing will come of it to bother you, child, for we shall leave here day after to-morrow, and of course you'll never lay eyes on the gambler's wife again; and I'll neverspeak about it to a soul, I give you my word. But—but don't you think there is something just a *little* funny in it all, Rose?"

It was one of the small trials of Vandyke Brown's life that his wife never saw the amusing side of this adventure. As for Mrs. Heintzbach, she set down to the general queeriness of Americans the peculiarity of Mrs. Brown's manner when, next day, she presented to that lady the promised letters to her Guanajuato relatives. For while Rose strove hard to maintain a tone of friendly cordiality, the underlying consciousness that she did not really want to be cordial and friendly rather marred the general result. Nor was Mrs. Heintzbach ever able to formulate a satisfactory hypothesis that would account for the fact that while the American party certainly visited Guanajuato, the letters of introduction as certainly remained unused.

THE SKIRMISH AT BUENA VISTA.

MR. MANGAN BROWN and Mr. Gamboge investigated the tanneries of Leon with much interest. In regard to the quality of the raw-hides, they expressed entire approval; but their strictures upon the tanning process, and upon the product in dressed leather, were severe.

"I am glad that the late Mr. Orpiment is not with us, Brown," Mr. Gamboge remarked, with some feeling. "The mere sight of such sole-leather as we have been looking at this morning would have given him an attack of bilious dyspepsia; it would, upon my word! I regard tanning like this," he added slowly and impressively, "as positively immoral. I am not at all surprised, Brown,—not the least bit in the world surprised,—that a nation that accords its tacit approval to tanning of this sort is incapable of achieving a stable government. I may add that I am sure that Mexico will lag behind all other nations in the march of progress until its leather business has been radically remodeled and reformed." And in this possibly extreme opinion Mr. Mangan Brown, who also was deeply moved by what he had seen, entirely concurred.

But the rest of the party, being blissfully ignorant of the tanning iniquities of Leon, were disposed to think the bustling little city altogether charming. Rowney Mauve described it happily as a mixture of the Bowery and the Middle Ages; young Orpiment delightedly made the studies for his well-known picture, "A Mexican Calzada"—the picture that made such a sensation when it subsequently was exhibited in New York; and while Brown was disappointed by his failure to discover so much as a single good picture in any of the churches, his heart was gladdened by finding all around him a rich abundance of material out of which good pictures might be made.

On the whole the verdict of the party already was strongly in favor of Mexico; and after its several members had enjoyed the perfect picturesqueness of Guanajuato—where the noble paintings by Vallejo in the parish church, and the still finer work by Cabrera in the *Compañía*, suddenly opened the eyes of the artists to the greatness of Mexican art—this pleasing sentiment expanded into and thereafter remained (with the exceptions noted below) one of unmingled approval.

Mr. Pemberton Logan Smith avowedly pined for the flesh-pots of Philadelphia. "I am not at all particular about my food, you know, Mauve," he said plaintively; "but hang it, you know, I do like a solid meal now and then; and except at that queer little place at

Lagos, where things certainly were capital, I'll be shot if I've had a solid, well-cooked meal since I came into Mexico."

"Have n't you though?" Mauve asked, with a slight air of skepticism. "Now, I was under the impression that I had seen you several times doing some tolerably serious pecking. Anyhow, you stowed away enough at Lagos to last till you get home again."

"Yes," Pem answered, "I did have some satisfactory feeding there. Jove! what a heaven-born genius in the cooking line that jolly old Gascon is! And don't I just wish that I knew where I could get as good a claret for as little money in Philadelphia or New York!" And Pem smacked his lips feelingly as he remembered Don Pedro's inspiring food and drink. But even sustained by this cheering memory, it was not until he was come to the City of Mexico and reposed, as it were, in the culinary bosom of Father Gatillon at the *Café Anglais* that Pem really was comforted.

The other exception in the matter of entire approval of Mexico was Mrs. Gamboge; and the point of issue in her case was a delicate one. To state it plainly, it was the bare legs of the agricultural laborers. In confidence she confessed to Verona that had she been informed of the custom of excessively rolling up their cotton trousers prevalent among the lower classes of male Mexicans, she certainly would have remained at home. What with this and the equally objectionable custom prevalent among the female Mexicans of the lower classes of insufficiently covering the upper portions of their bodies, Mrs. Gamboge declared that the average of dress among the lower classes of Mexico was reduced to a point considerably below that at which inadequacy of apparel became personally shocking and morally reprehensible. And all the way from Silao to the City of Mexico—which journey, from point to point, was made by the day train—Mrs. Gamboge sat retired within her prison-like "drawing-room," her face resolutely turned away from the windows, and both the blinds close-drawn. Not even the beautiful cañon south of Querétaro, not even the extraordinary loveliness of the Tula Valley, could tempt her forth from the rigid propriety of her retreat.

"Either the railroad company should take the necessary legal measures to compel these men to wear trousers as they are intended to be worn," Mrs. Gamboge declared, "or else it should build a high board fence on each side of the track." And neither from this decided opinion nor from her self-imposed seclusion could she be stirred.

It was with a feeling of some slight relief, therefore, that Mrs. Gamboge found herself,

at the end of the long run from Querétaro, delivered from the prominent presence as a feature of the landscape of unduly bare-legged laborers by the arrival of the train at the Buena Vista station in the City of Mexico. She thought it highly probable that other shocks might here await her; but she had at least the sustaining conviction that the male members of the Mexican lower classes dwelling in cities as a rule kept their trousers rolled down.

As the party moved away from their car towards the gates, at the farther end of the station, they passed the night express train that in a few minutes would start for the north. A little group stood by the steps of the Pullman car, and the central feature of this group was a young woman whose traveling-dress betokened the fact that she was about to depart on the train. "See what stunning eyes she's got, Rose," Vandyke Brown said in a discreetly low tone, "and look how well she carries herself. I'd like to paint her. She'd make no end of an exhibition portrait."

Just at this moment Violet, who was a few steps ahead of them, gave a little shriek; and then the strange young woman gave a little shriek, and then they rushed into each other's arms. Rowney, from whom Violet had broken away to engage in this rather pronounced exhibition of affection, stood by placidly until it should come to an end. He was accustomed to Violet's rather energetic methods, and in the present instance his only regret was that he was not in the running himself. But even Rowney's placidity was a little disturbed when Violet, having detached herself from the young woman, proceeded with a similar vehemence to cast herself first into the arms of an elderly lady, then into those of an elderly gentleman, then into those of a middle-aged gentleman, and finally into the arms of two quite young gentlemen, all of whom embraced her with what Rowney considered, especially upon the part of the young men, most unnecessary fervor, the while patting her vigorously upon the back.

If Rowney had contemplated lodging a remonstrance in regard to this, from a New York standpoint, abnormal exhibition of friendship, he had no opportunity to do so. Before he could open his mouth Violet seized upon him and dragged him into the midst of the little group, where his demoralization for the time being was made complete by finding himself passed rapidly from one pair of arms to another and embraced by these friendly strangers with quite as much enthusiasm as they had manifested in embracing his wife. During this confusing experience he was conscious that for a moment he was clasped in the soft

arms of the handsome young woman, and realized, as he remembered his wish of but a moment before, that the fulfillment of human desires is not necessarily attended with perfect happiness.

"O Rowney!" cried Violet, "do be glad to see them; don't look so scandalized and horrified. They are ever so glad to see you. Don't you understand? This is my very dearest, dearest friend, Carmen Espinosa, and this is her uncle, Señor Antonio Ochoa, and this is his younger brother, Señor Manuel Ochoa, and this is her aunt, Doña Catalina,—Don Antonio's wife, you know,—and these are her cousins, Rafael and Rodolfo. Oh! is n't it perfectly delightful! And to think if our train had n't come in exactly on time we should have missed them; for Carmen and all of them are going to Guanajuato to-night!" And Violet once more threw herself into her friend Carmen's arms.

Meanwhile the American party had halted and had gazed at Violet's demonstrative proceedings with a very lively astonishment, that became a less serious emotion as they contemplated the ill grace with which Rowney suffered himself to be inducted into the amicable customs of Mexico.

"Upon my soul, Gamboge," said Mr. Brown in some alarm, "we'd better get out of this, or Violet will be turning her friends loose at hugging us too. I hope that I should get through with the performance, with the pretty girl, anyway, better than young Mauve did, but there's no telling; and, I must say, I don't want to try." That Violet would have introduced her friends is quite certain, but just as she was about to begin this ceremony, and while Rowney was endeavoring to atone for his want of animation during the period of the embraces by making such civil speeches as were possible with the limited stock of Spanish at his command, the starting-bell sounded, and the Pullman conductor summoned the party with a firm civility to enter the train. This time, greatly to his relief, Rowney found that nothing more than an ordinary shaking of hands was expected of him; and as he knew in a general way the proper speeches to make on such an occasion, he got through with the business of leave-taking in fairly creditable form.

"Only you ought n't to have said 'Adios,' Rowney," said Violet, correctly. "That is the same thing as the French *adieu*, you know. You should have said 'Hasta luego,' for that means *au revoir*, and they had just told you that they would be back in the city in a week. It is dreadfully stupid the way in English you say just as much of a 'good-bye' to a person you are going to see again in two hours as you say to a person who is just starting on a journey

around the world. But is n't it lovely that we met them? And don't you think, Rowney, that *Cármen* is the dearest dear that ever was? It's the *Cármen* I've told you of a thousand times, Rowney; the one who was in the Sisters' school with me. If I were good at letter-writing I should have written to her every week; but I'm not very good that way, you know, and I don't believe she is either, and so we've never heard a single word about each other in two years. She did n't even know I was married; and when I said I was married to 'that handsome man, there'—yes, I did say that, and you ought to be very much obliged to me, Rowney—and pointed to where you all were standing, she actually thought I meant Mr. Smith! Was n't that a funny mistake? Mr. Smith certainly is a nice-looking man; but he is not so nice-looking as you are, Rowney, even if I do say it myself and puff you all up with conceit. And now do let us hurry to the hotel. I know that we'll get something good, and I'm so hungry that I could eat trunk-straps and top-boots, like the people who are wrecked and spend forty-seven days in an open boat at sea."

And as Violet's condition of incipient starvation was that of the whole party,—for they had breakfasted at 1 o'clock in the afternoon at San Juan del Rio, and it now was after 8 o'clock in the evening,—the move towards the *Café Anglais* and dinner was made with the least possible delay.

Pem sat next to Violet at dinner, and before she had swallowed her soup he began to ask rather pointed questions about her charming Mexican friend.

"Now I tell you frankly, Mr. Smith," Violet declared with much positiveness, "that until I have had something to eat I shall not say a single word. I have a perfectly clear conscience, and that means, of course, that I've got a good appetite; and I have. If you've got a bad conscience, and consequently a bad appetite, that's no fault of mine; and I don't intend to suffer for your sins. So, there!"

But even when Violet, having satisfied the cravings of hunger, was disposed to be communicative concerning her friend, her communication was eulogistic rather than informing. Beyond the fact that *Cármen Espinosa* belonged to very nice people whose home was an hacienda up in the Bajío, she had very little to tell. They had been together in the school of the *Sagrado Corazon* for two years. Then Violet had gone back to her father's hacienda, and a year later had gone on her expedition to New York, that had ended in keeping her there as the wife of Rowney Mauve. A letter or two during the first six

months after their separation had been their only attempt at correspondence. Of her friend's life during the past two and a half years she knew nothing. But she was the best and sweetest and dearest girl that ever lived—and so on, and so on.

Pem was rather silent as he smoked his cigar with the other men over their coffee, after the ladies had retired to their rooms. There was some talk among the artists about the work that they intended doing; and presently Pem roused up and said:

"Well, I'll tell you what I'm going to do. I'm going to Guanajuato to paint that view of the Bufo from up by the highest of the *presas*. It's the finest thing I've seen in Mexico, and I mean to get it. I'm going to-morrow."

There was a stir of astonishment at this outburst of vigor on the part of Mr. Smith, and his announcement was met, not unnaturally, with comment tending towards skeptical criticism.

"I did think that you was resolvéd, Mr. Smeeth, not to touch one brush while in thees land," said *Jaune d'Antimoine*, seriously.

"And so did I," added Brown. "What's got into you, old man, to break down your virtuous resolution to be lazier than usual?"

"Look here, my dear fellow," Rowney Mauve put in, "I'd like to know what's to become of me if you take to working? Don't you see that I rely on you for moral support? But you don't mean it, I'm sure."

"I do mean it, and I tell you I'm going to-morrow. I've always meant to take home one picture from Mexico; at least, I've always rather thought I would. And the more I think about that view of the Bufo, the more I'm determined that that shall be what I'll paint."

Pem had been known to make resolutions of this sort before without any very startling practical results ensuing, and not much faith was placed by anybody in his stout assertion. But faith was compelled, early the next evening, when he stated that he was about to have an early dinner in order to catch the north-bound train, and then bade everybody good-bye. And off he went, with the parting shot from Brown that Saul among the prophets was n't a touch to him.

In the privacy of their respective chambers that night Brown and Mauve expressed to their respective wives their astonishment at this extraordinary manifestation of energy on the part of their Philadelphia friend.

Rose smiled in a superior way and said: "Really, Van, I sometimes think that you are about as stupid as even a man can be! Why, don't you see that Mr. Smith has gone after that pretty Mexican girl?"

And Violet, in response to very similar utterances on the part of Rowney Mauve, very similarly replied: "You are a great goose, Rowney. Mr. Smith has gone after Carmen, of course. I knew what he was up to at once, and I thought I'd help him a little, and so I

— I asked him if it would be too much trouble, since he was going to Guanajuato anyway, to take a letter from me to my friend. And you just ought to have seen how very grateful the poor fellow was! But you must n't tell, Rowney; that would n't be the square thing."

(To be continued.)

Thomas A. Janvier.

THE CRYING BOG.

A LEGEND OF NARRAGANSETT.

THE sun sinks slowly to the west,
The night comes veiled in fleecy mist
It rolls across the ocean's breast,
Each swelling wave is lightly kissed,
It pauses at the sunlit land,
Then softly covers sea and strand.

Beside the Petaquamscutt shore,
Beneath the shadow of the hill,
A traveler passes, and once more
Looks toward the mist so white and still.
With hurried steps his way he makes
Among the rushes and the brakes.

His foot is on the oozy marsh,
He backward starts in wild affright,
Above his head he hears the harsh,
Strange cry of hawks: down comes the night,
The whispering rushes bode of ill;
Down comes the night, soft, pale, and chill.

Sudden he hears from out the dark
A baby's cry. Poor little child,
What does it here? Again, and hark,
The cry is clear, and strong, and wild;
Some frightened child is surely near,
A child who cries a cry of fear.

He plunges onward through the reeds,
Relief and succor fain would bring —
The fog is thick, but some one needs,
He strives to find the suffering thing.
Though beast or bird, his manly breast
Would give it shelter, warmth, and rest.

Lo, on the bare and humid ground
A woman crouches, dark of face,
An Indian woman: all unbound,
Her black hair falls in maiden grace;
Her ghastly looks are wan and wild,
Beside her lies a newborn child.

The baby cries its plaintive cry,
The mother answers with a groan;
Recoils in terror, then draws nigh,
And lifts the child with sobbing moan.
She drags her wearied limbs with pain,
The baby cries its cry again.

She feebly hastens toward the shore,
With horror scans her baby's face.
Then hastens faster than before —
The child is of an alien race.
They reach the marsh, the water's nigh,
The baby cries its plaintive cry.

The traveler shudders, strives to run,
His spell-bound feet his will refuse.
This dreadful deed must not be done,
His muscles tense he cannot use.
He strives to give a warning cry —
He utters it, a voiceless sigh.

Alone he sees the dreadful deed:
Far in the marsh the child is thrown;
Caught in strange spell, he cannot plead.
And now the mother stands alone
In solitude, despair, and shame,
In wretchedness without a name.

Men call the place the Crying Bog,
And hasten by its tangled reeds;
When night comes veiled in fleecy fog
The ghostly child for pity pleads —
The child whose voice can never die,
Whose only life is in its cry.

Caroline Hazard.

THE EXPERIMENTS OF MISS SALLY CASH.

BY RICHARD MALCOLM JOHNSTON.

THE front gate of Mr. Singleton Hooks opened almost immediately upon the public road. Several large white-oaks stood just outside the yard, each with its couple of horse-shoes, for the accommodation both of visitors and of those who came on business. For one of his negro men constantly worked in the blacksmith's shop at the intersection with the main thoroughfare of a neighborhood road that, coursing alongside the garden and front yard, crossed and continued on in a southeasterly direction towards the county-seat.

Half a mile farther west, equally near to the road, but on the south side of it, dwelt Mr. Matthew Tuggle. Claiming to be only a farmer, yet, by trading in horses and by other speculations, he kept himself about even with his next neighbor in prosperity, and it would not have been easy to say which of the two owned the more valuable property.

Different as they were, good friends they had been always. They ought to have been indeed; for their wives were cousins, and fond to affection of each other, as were their daughters, Emeline Hooks and Susan Ann Tuggle. The difference between the heads of these families may have served as a foil to unite them more closely. Mr. Hooks, tall, slender, whose long iron-gray hair and solemn port made him look above though he was somewhat under forty-five; a justice of the peace; a sometimes reader of books judicial, medical, and theological; a deacon, even an occasional exhorter — imagined that he would have more loved and respected his kinsman by marriage but for his worldliness. On the other hand, Mr. Tuggle, stubby, but active as a cat, without a single white streak in his fair bushy hair, professed in every company affection, admiration, even reverence for his Unk Swingle, as, in spite of some not very urgent remonstrances, he always called him.

The most besetting of Mr. Tuggle's sins was dancing. Mourning, as Mr. Hooks often did, the prevalence of this amusement, even among many leading families, yet he neither would nor could deny that, even after he had become a married man, he had liked both the cotillon and the reel, and sometimes indulged even in the jig. Mortifying as it was to confess,

down to this very time the sound of the fiddle was so pleasing to his ears that he had to keep himself beyond its reach. Yet he was truly thankful that before it was everlastingly too late he had seen himself a sinner in the broad road, and betaken himself to the strait and narrow way. Often in his affectionate solicitude for Mr. Tuggle, he would say about thus:

"Now there 's Matthy Tuggle: as everybody that know Matthy is ableged to acknowledge, he 's a toler'ble, passable, good-hearted creeter, ef he could jes ric'lect that his young days is over, and a man 'ith a family of his age ought to set a' egzample by good rights to the risin' generations of his own and other people, 'stid of prancin' his legs, short as they might be, to the fiddle, and no great shakes at dancin' at that which, because he 'll tell you hisself that, in them times when I followed the practice, he never much as hilt a light to the foot I slung in a quintillion when my dander were up, the fiddle chuned accordin' to the scale, and my pard'nter ekal to her business. But, the deffunce betwix' me and Matthy, I see they were a jumpin'-off place to sech as that, and I had the jedgment to git out o' the way o' the wrath to come; but Matthy let *his* legs, duck-legs ef they might be, keep on a-runnin' off 'ith him; and which exceptin' o' that, Matthy Tuggle might be'n one o' the pillars o' the church; because he not a bad man in his heart, and Brer Roberts give his opinions he 'll git converted from his ways; but ef so, seem to me like high time; and, tell the truth, a body can't help prayin' for him, ef it do look like flingin' away powder and shot. As for him a-callin' me his Unk Swingle, everybody know Matthy will have his jokes, spite o' his knowin' they ain't more 'n a munt in me and his age. Yit I can't help lovin' Matthy, spite o' his young, childless ways. When a man want advices in his business he know how to give it; and when a body need sech a thing, they ain't nobody got a better back-bone to prize him out o' de-ficulties. That 's Matthy Tuggle, and ef he jes had grace, they — positively, they ain't no tellin'."

Mr. Tuggle, far less loquacious, yet indulged in an occasional antiphon.

"Unk Swingle is a good man, a' excellent good man. Fact, Unk Swing Hooks what I call righteous man, well as bein' of a smart man. I got nothin', course, ag'in his right-

eousness, but yit I cannot foller him in makin' out dancin' sech a devilish, oudacious piece o' business all of a suddent, and special when I ain't forgot before he were converted, and his ekal on the floor I have yit to see; but yit he were then jest as honest as he is now; and, natchel supple as them legs o' his'n is, I would n't swear he'd never spread 'em ag'in to the fiddle, provided he 's overtook sometime and he can do it ruther onbeknownst. He ain't the old man he make out like, not nigh."

Each of the young ladies had inherited her father's most striking characteristics, physical and moral. Miss Hooks, serious, tall, although religious, was rather more charitable than her father towards the worldly-minded. Miss Tuggle, petite and gay, was fond of the dance and other sports that she believed to be innocent. Both were handsome and nearing to twenty years of age. It had come to be understood that whoever was to marry either would have to bring other things besides good looks, good habits, and good social standing. Nobody could have foreseen that the confidence and affection between these young ladies, so fine, so closely knit in sentiment and in kin, would give place to coldness, suspicion, and jealousy. Indeed nobody, however wise and prudent, can foretell upon any sort of persons, to say nothing of young ladies in special, the effect of domestic afflictions on the one hand, and on the other, the settlement in the neighborhood of a new marriageable man, giving promise of a successful career in an interesting business.

II.

THE plantations, each comprising several hundreds of acres, lay on both sides of the road, and were adjoined, east of Mr. Tuggle, south-east of Mr. Hooks, by that of Miss Sally Cash, near by whose residence led the neighborhood way aforementioned and another, beginning at a point on the main thoroughfare a mile east from Mr. Hooks. Here a country store had been set up lately.

Professing to be as independent a woman as ever drew the breath of life, yet Miss Cash, partly for company's sake, partly for convenience, usually had with her one or another of the young sons of her cousin, Mr. Abram Grice. Left, when a young child, an orphan and poor, with the work of her hands she had paid fully for the care bestowed by her kinsfolk during her minority, and afterwards, by industry, economy, and judicious investments, become owner of a good plantation and about a dozen slaves, all paid for. For some years last past upon her countenance and in her deportment

had been visible the air of conscious prosperity.

A tall woman was she, somewhat thin, blue-eyed, reddish-haired. It was only lately that had appeared on her cheek the blush that through her earlier years had delayed. This advent was due, she claimed, to release from her most arduous work, but perhaps mainly to the fact of her never having had a man about the house to delve and work for, and try to please, and be hectored over, and so-forths of various sorts. Hitherto she had not been supposed to be or wish herself on the matrimonial carpet. For men in the abstract I don't remember that she ever had been heard to express either earnest hostility or contempt, because, as often in conversation she frankly admitted, her own father before his death had been a man; not only so, but her own blessed, dear brother, if she had ever had one, must have belonged to the same sex. But when the question came to taking one of these creatures into her house, and giving up to him not only her name, but the property for which so long and laboriously she had toiled, that, to use one of her favorite metaphors, was a gray horse of entirely another color.

Of late, however, contemporaneously with the new sheen upon her face, the tone of her remarks touching the male sex had begun to show some change. Sometimes, after remarks sounding of sarcasm, she would moderate their sharpness, and say about as follows:

"And yit," smiling in the careless manner so common and so secure in ladies of property, "don't you know, thes here lately I be'n a-studyin', and I be'n a-runnin' over in my mind, that ef—that 's that I did n't know but what—good opechunity, you mind—I might make a expeermunt, ef thes only to see what they is in it that make so many women go through what they go through with, ruther than they 'll run the resk of being called old maids, and exact' the same of widders when their husbands has died off and left 'em. Now, fur as the being of dead in love with any man person as ever trod the ground, like warous women that I have knew, and that no matter how much trouble and sickness, and hives and measles, and whoopin'-cough, and the ackuil dyin' o' their offsprings and childern, and husbands in the bargain, and then afterwards gittin' of another, which of course my expeunce have nothin' to do 'ith all nor none of sech; and, as fur my a-sendin' roses and pinks, and bubbly-blossoms, and even makin' pincushions and knittin' money-pusses for their beaux, as some girls does these days, of course sech as that and them is not to be expected of me, a not'ith-standin' they are a plenty o' women older than what I call for, and them not married at that;

but it would not suit my idees of delicate, sech as that and them. And — yit — well, thes here lately, a thes a-settin' by myself, I be'n, er ruther my mind be'n, a-consatin' what sech might be if it was to happen onexpected like. Because, don't you know, when a person of my time o' life, and special when she's a female person, and which I've freckwent thought, though of course I know that were not the fault of my parrents, although it look right hard *some-where*s, that a orphin child 'ith no more prop'ty than she have, nother father ner mother, ner brother ner sister, she were left in the female kinditions I be'n every sence I knewed myself, and have to scuffle and baffle my own way along and up to my present ockepation o' life, which, a not'ithstandin' I am thankful that not a dollar nor a cent do I owe for this plantation and niggers, hous'le and kitchen furnichurs, stock ner utenchul. But — and ah! there come' in the question — to who? And my meaning is: 'ith a female person in my kinditions, who shall the said prop'ty of sech warous kind go to, when, as the Scriptur' say, the thief knock-eth at the door when he ain't be'n a-expectin'; because prop'ty cannot foller a body in the ground, and it would n't be no use ner enjoyment of it could. So you see fur yourself, that they is more than thes one views to take of thes one loned female, ef indeed she may try to keep herself perfect cool, spite of iduil thoughts occasional. I try to be thankful to the good Lord ef I've be'n a person that had to work hard, I've be'n a person as had appetites for my victuals and a plenty o' them. But it go to show what warous thoughts a female person like me their mind will run on sometimes, that she live by her lone self, a not countin' Abom Grice's Tony, and special these long nights, that it's too soon to go to bed, and she git through the reelin' of broaches and windin' of balls, and she got more stockin's now than she have any use fur, and then to thes set and study in their mind till they git sleepy, which I'm honest thankful that don't take more 'n 9 o'clock never; and when my head do once touch the pillar, then 'Farewell, world,' tell the chickens crow next mornin'."

Talks like these, new to Miss Cash, but becoming more and more oft repeated, led in time to the suspicion that her mind, however resistant theretofore to love's influences, was approaching a reasonable degree of receptivity thereto. But I advance no opinion on the possible connection between the late diversion in her views touching her own possible change of condition and the unexpected demise of Mrs. Tuggle.

For a time the loss of so dear a companion depressed Mr. Tuggle to a degree that hopes were indulged by Mr. Hooks that his afflic-

tion might prove a blessing in disguise, and lead him to knock at the door of the church. Much of his time was spent with the Hooks family, from whom, particularly the ladies, he sought the consolation that his daughter had not the heart to offer. These occasions, and others whereat he may have been present, Mr. Hooks essayed to improve by such counsel and warnings as seemed needful and apposite. By degrees, however, it appeared likely that the mourner would look for his most satisfactory relief in substituting, if one every way suited could be found and obtained, another woman in the place of her who had departed from him. Not that Mr. Tuggle made any great change in his dress, or indulged in unseemly gayeties. It was mostly that, when in the company of marriageable ladies, or when being only among gentlemen the subject of marriageable ladies was under discussion, his face evinced an attentiveness that was believed to indicate that his mind was not only interested but decently alert.

Mr. Hooks was sorry to have to admit that he was disappointed.

"It do look like," he said one day to his wife and daughter, "that Matthy, 'stid of takin' of warnin' from his affliction and lookin' forrards to his own latter end, is a-makin' of prip'rations for another lease o' his life, which he ought to know he can't count on no great lenks; but it only go to show when a worldly man like him git to be widowers, what they'll be fur up and doin' before grace can git a holt on 'em. Now, I'm not a-denyin' that him and Sally Cash jinds plantations, as both o' 'em jinds along 'ith me; and ef it's their desires to fling both into one, that's their business. And, tell the truth, Sally a good, industrious woman that have a good prop'ty, and I'm not a-findin' fau't 'ith her for sprucin' up so fine lately and carryin' about 'ith her so much red o' one kind and another. For Matthy Tuggle a man worth all her whiles. But it do seem to me, ef I was in Matthy's place, I should ask the question, and I should ask it on my knees —"

"Pshaw, Mr. Hooks!" interrupted his wife. "It's easy enough asking questions. The thing is answerin' 'em. As for widowers getting married again, they'll all do it, and them generally does it the quickest that's the surest they won't in their mind when their wives is a-living. As for Cousin Matthy, I think he behave very decent, considering, and Emeline think the same. He have told us both that if it may n't be impossible for him to look out for another companion, he have made up his mind to be keerful; and a better husband no woman ever had than poor Cousin Betsy. But Mr. Hooks, I wish you would n't be supposening you was in Matthy's place."

"I was only a-sayin', my dear wife, how in sech a case it would be grace, and nothin' but grace would let me stand it; and ef I could only make you more keeful about your l—"

"Do, pray, Mr. Hooks, don't begin on that everlasting subject."

Then she rose and left the room.

"Pa," said Emeline, "if I was in your place, I would n't talk to Ma so much about her bad health, and specially what she says you are always bringing up about her liver."

"Emeline, my darlin'," he said with mournful remonstrance, "you know what your ma is to me and you too, and that what make me so anxious, and try to make her take better keef of herself. You think your ma hain't acknowledged to me, time and time ag'in, that not untwell she were married to me and I told her, that folks *had* livers, when it 's the very importantest, and delicatest, and danjousest cons'titution o' people? My advices to you is to try to convince her of the needcessity of whut she eat, and how she eat. Her appetites is not large, but they *is* resky."

III.

THE changes in the tone of conversation and other deportment of Miss Cash were followed by another that was particularly gratifying to Mr. Abner Hines, a young man anywhere between thirty and forty, who not long before had come into the community and set up the store aforementioned. The merchant was polite, courteous, social, obliging, reasonably easy to be intreated about his prices, and it soon appeared that in time he would do better than had been expected. In the case of Miss Cash, who from the first had regarded the enterprise with considerable interest, her purchases, careful, even stinted at first, lately had been growing notably more generous. Mr. Hines had an ambition to get as much as possible of her ready specie, consistently of course with the rendering of just equivalent, and he began to believe that he had cause to congratulate himself.

"Not," he would say confidentially to several customers, one at a time,— "it's not that Miss Sally don't yit beat you down in the price, like she always have. But here lately she go for a finer article, and a article that 's fashionabler than what she used to be willin' to put up with. She want the best, she say; and knowin' I got to fall, I generally raises on her in the askin' price, so as to leave room for not droppin' too fur not to make a livin' profit."

Mr. Tuggle was one of those who had commented, though always without any sarcasm, on some of the lady's peculiarities. Yet now he spoke of her invariably in terms not only of

much respect but of admiration. Respecting his daughter's feelings and neighborhood opinions of decency, he did not yet go to Miss Cash's house; but whenever he saw her riding-nag standing at a neighbor's gate or at the store he would alight, and deport himself now as if recently he had been studying manners with special reference to her. Outsiders believed that they could see in both a tendency towards each other that understood itself enough not to be in special haste. Mr. Tuggle, although improved in his dress, behaved with more decency than is common with widowers. The seriousness that he took on at the beginning of his bereavement continued, and it was gratifying to all the Hookses; for the ladies of the family, like their head, if coming short of his outward degree, were religious. For a man that had not studied the art of music specially, he was a good singer; and often, on Sunday evenings, when perhaps Mr. Hines (who was fond of visiting, particularly at these two houses) may have called on Susan Ann, and their conversation was not very interesting to one in his lonely condition, he strolled to his next neighbor's, and he and Emeline, joined by her mother, when well enough, would spend quite a time in the singing of hymns. Mr. Hooks liked these exercises, mainly for the hope, feeble as it had become, that before his serious season had fully passed, Mr. Tuggle might see the need of diverging from the broad road along which he had been traveling for, lo! those so many years.

"Ef Matthy," he said one evening after Mr. Tuggle had left—"ef he only had the sperrit ekal to his woices, they 'd be some hopes of his convictions and conversions, in course under grace; for everybody that have studied Scriptur' know that 'ithout grace 't ain't worth whiles for a sinner to try to move one blessed peg. But I do think the idee a man at his time o' life a-wishin' and a-wantin' and a actuil' a-desirin' to git married ag'in—"

"Need n't talk to me about widowers," abruptly put in Mrs. Hooks. "They're as certain to marry again as the days is long. The thing is for 'em to try to marry suitable."

"Well, ef it 's to be Matthy and Sally, the question 'll be how she and Susan Ann is to congeal together; because they've both of 'em got a temper o' their own, that nary one of 'em is willin' to be runned over, jes dry so."

"My opinions is," said Mrs. Hooks, "that right there 'll be the difficulty, and I have told Matthy so in them words."

"What Matthy say?"

"He said nothing; but he look like he were pestered and jubous in his mind."

"Umph, humph! Well, I 'm thankful it ain't me; and I should never expect it to be

me of my advices would be took for the rig'lations—"

But he again, though reluctantly, suspended when approaching a subject painful to his wife to hear discussed.

Many such conversations were had between this loving husband and his wife, always interspersed with affectionate salutary admonitions. Mr. Hooks used to say—that is, before he had become a church-member—that really he had his doubts which he was most cut out for, a lawyer or a doctor; but since that momentous epoch, he was confident in his mind that his proper sphere, had he only known it in time, would have been that the center whereof was the pulpit; and he used almost to intimate what he might do therein even now but for his justice bench, his blacksmith's shop, and his large gin house, in which a considerable portion of the public had interests coördinate with his own.

During all this while Susan Ann Tuggle had grown more and more anxious at the thought of the marriage of her father, especially with Miss Cash. Confidence between parent and child had been checked by the former's prompt rebuke of some sharp words spoken by the latter touching the lady in question, and afterwards they had gotten into the habit of carrying their burdens separately to their relations down the road.

"O Emeline! Emeline! If Pa brings another woman to our house to hector over me, and special' old Miss Sally, I leave for the—for the first place I can find a home at with respectable people."

"Be calm, Susan Ann, and don't be scared and go to fretting before the time comes. I think Cousin Matthy have behaved right well so far, considering. I never heard a parrent talk more affectionate of their daughter than he have been talking about you here lately."

"Oh, these widowers can be affectionate enough, but the more affectionate they are, the more they go on the idea that they must have a mother for their orphan children; but I want nobody in Ma's place, and special' old Miss Sally. Yet I mean to try to hope for the best; but I tell you now, Emeline, that if it come to the worst, I shall take the first chance that comes that's decent, and get married myself."

More serious, far more pious, than her cousin, Miss Hooks was accustomed to employ Scriptural phrases for her own and others' comfort. With calm earnestness she counseled Susan Ann to possess her soul in patience, and endeavor to remember in all circumstances that afflictions, though they seem severe, are oft in mercy sent.

"And which, Susan Ann," she said in con-

clusion, "no longer than last Sunday evening, when me and Cousin Matthy were singing for Ma, who was n't well enough to join in with us, and we were a-singing that veriest hymn, and I happen to look at Cousin Matthy, I think I see his eyes water, and I know I see his mouth trimble."

IV.

PROFOUND as was the sense of loss in the breast of Mr. Hooks, when, a few weeks after the events last herein told, his wife followed her cousin on the old-fashioned, unavoidable way, there was no telling to what deeper depths it might have descended but for the merciful fact that he was thoroughly cognizant of the cause to which mainly her departure was attributable. Her pious resignation, he hoped, was credited for all that it had contributed to the comfort that he was enabled to take. But that which seemed the controlling element in that behalf was the recollection of having made an unerring diagnosis of the malady which had torn her from his arms.

"The de-ficulty 'ith my poor, dear Malviny," with calm melancholy he said often during the season of mourning, "were her liver, that kyard her off from this spears of action like the thief of a night when no man can work, but people's asleep and a not a-lookin' for no sech. I have saw, and I have freckwent noticed, and that more than a munt before she taken down; and it were her complexions and weak stomach she have for her victuals, because her appetites, ever sence I have knowed her, and special' lately, they has not been large, but they has been resky; and I has told her so time and time again, in course in a affectionate way; and when the doctor have to besent fur, I told *him*, plain as I could speak, no matter what he give, 'ithout they'd rig'l'ate her liver they would n't fetch her back to her wanted healths. And I give him the credic, he done his lev'lest best; not only bleedin', but calomel and jalap. In course, I'm not a-denyin' that my poor, dear wife had to go when her time come; but yit, I can't but be thankful I knewd the de-ficulty, and I left down no gaps in the tryin' to powide ag'inst it."

The consolations from this benignant source supported Mr. Hooks to a degree that made him extremely thankful. Recognizing that duties to the living could not be paid fully by a man (especially with his various vast responsibilities) who went about mourning all his days, he turned, after a brief while, his back upon the graveyard, and tried to present, first a resigned, soon a cheerful, face to the world outside of it. It began to be remarked that his conversation, general carriage, even

his person, were brighter than for years. For now he dressed and brushed himself with much care; and before long, instead of bestowing monitory looks and words upon jests and other frivolities of the young and the gay, he not only smiled forgivingly, but occasionally with his own mouth put forth a harmless anecdote at which he laughed as cordially as he knew how, and seemed gratified when others enjoyed it.

Singular as was the contrast, the seriousness in the whole being of Mr. Tuggle seemed to deepen after the affliction that had fallen upon the Hooks family.

"The fack is, Emeline," he said one Sunday evening, "sorry as I'm obleeged to be fur myself, I can't help symp'thizin' 'ith you, a-knowin' what your ma were to you, and how you miss her. Now Susan Ann, poor girl, she look to me like she think less about her ma than about her who 's to take her place."

"Cousin Matthy," answered Emeline, "if anybody ever stood in need of symp'thy in this wide and sorrowful world, it's me. Law, Cousin Matthy, you think Pa mean anything by his jokes and getting so many Sunday clothes?"

"Less said about 'em, Emeline,—that is, by me,—soonest mended."

After reflecting a while, she said, "I think Miss Sally a fine woman, don't you?"

"Remockable, remockable; and so do your pa."

"O Cousin Matthy! Do, pray, please, Cousin Matthy, don't let Pa go to courting—at least before poor Ma have been in her grave a decent time, and special' that—oh me! What is a poor orphan girl to do like me!"

"What to do, Emeline? Why, wait and see. Your pa not an old man, by no manner o' means, and it's natchel he may not be willin' to pass for one before the time come. But wait and see, and be cool and keerful. Any advices I can give, you know I'll do it."

Much of other like conversation was had after they had been singing together for some time. For a while Mr. Hooks, while sitting or promenading on his piazza, had listened with more or less interest, until by some chance the selections began to grow extremely sorrowful; when, taking his new hat and his new cane, he walked up the road.

"Evenin', Susan Ann. I left your pa and Emeline a-singin' of hymes. I listened to 'em tell they got on them solemn and solemncholy ones, that somehow don't congeal along 'ith me in the troubles be'n on my mind, and I come up here to see ef you could n't stir up somethin' to help out a feller's feelings. What's all the liveliest times 'ith you, Susan Ann?"

"Glad to see you, Cousin Sing'ton," Susan

Ann said cordially. "Well, now, let me see. Ay, I've got it! Did n't Miss Sally look nice and young to-day at church with her new red frock, and her new green calash, and her new pink parasol, and her new white crane-tail fan, and her new striped ribbons, and her cheeks that just blazed like a peach, did n't she?"

"That she did! that she did! Miss Sally begin to look these days nigh same as a young girl, special' sence they have got to be more marryin' men, ah ha! I notice her startin' to spruce up soon arter your—howbe'ever, a man ought n't to express hisself undilicate to them that 's interested in the case, ahem!"

Her tone changed instantly.

"Cousin Sing'ton, you don't mean Pa? I'm sure—that is, I think—Miss Sally is setting her cap for *you*, and seem to me she'd suit; she certain' have been more dressy and pink in the face since—since you come on the carpet."

"Well, it only go to show the deffunce they is in people. Now Emeline say she shore in her mind Miss Sally, ef she had to choose betwix' us, she'd lay ch'ice on your pa."

"Did Emeline say that, Cousin Sing'ton?" she asked with darkling brow.

"Now, Susan Ann," with prudent tone, "I don't say them was her wery langwidge, and I don't know as I were ad-zactly in order to name to you them words o' Emeline, because it would seem like a pity fur you and her not to keep on o' bein' the affection't' couples you've always be'n."

"If Emeline Hooks is trying to marry off Pa to that—the fact of the business, it is n't fair all around, nowhere, Cousin Sing'ton."

"As for suitin' all parties, fur your pa and Sally to jind in banes, Susan Ann, I might have my doubts—that is, in my own minds, and not a-expressin' 'em. Thar, right thar, they is a deffunce, and I should n't wish by no manner o' means for even these few primary remarks to be named, either to Emeline or your pa."

Susan Ann was silent for a while, then said, "Don't you think Mr. Hines wants to court Emeline, Cousin Sing'ton?"

"Well, now, Susan Ann," he answered, in the manner of one desirous to avoid full disclosures of family secrets, "ef Mr. Hines do, him ner Emeline have named sech to me. I would n' be thunderstruck surprised ef he might desires sech a thing ef he had the prop'ty to put it through. They both know, I supposen, that a man that have the prop'ty I pay taxes on, and it a-increasin' every constant in warous way, I should expect a son-in-law to fetch, ef he can't fetch land, fur him, besides of what goods he have visible in his stow, to fetch along a reason'ble, size'ble pile

"EVENIN', SUSAN ANN."

o' niggers. These would be my advices to Emeline and to all young wimming. I don't know how freckwent the times I've 'membered what my father used to say freckwent when he was a-livin', about people a not allays bein' keerful enough who they got married to, and that is that people ought to be allays keerful not only to look whar they leap, but whar they lope. As for me, that is, my own self, a not'ithstandin' I feel a'most a right young man jes grown, sech is my healths, and my strength, and my sperrit, yit my intentions is to look same as a hawk whar I'm a-leapin' and whar I'm a-lopin' both; and as I can't talk 'ith any satisfaction along 'ith Emeline, I shall 'casional' consult your advices, which, my opinions is, you have a stronger jedgment than her on them important subjects."

The words of Mr. Hooks during this and much other conversation were interpreted by Susan Ann as intimating his wish for her in-

fluence in his behalf with Miss Cash, counting upon her exerting it freely after learning that Emeline was rendering like service to Mr. Tuggle.

v.

FRIEND as well as neighbor Miss Cash had been to both the ladies lately deceased. A famous nurse in sickness, she had tended their decline with assiduous, tender care, and the tears shed by her at their departure were as hearty as they were copious. Yet, while observing proper decorum whenever in the company of the bereaved, she grew constantly more lively in gait and conversation, more addicted to visiting, and far more expensive and pronounced in apparel.

"It ruther astonish," Mr. Hines one day said to Mr. Hooks, after selling to him the materials for yet another suit, "and it put me up to get things fine enough for Miss Sally."

"Right, Mr. Hines, she's right. A' excellent, a fine, a what I call a superfine woman, and I would n't object anybody a-tellin' her I made them remarks. And how young she look! and her jaws red same as a rose. My, my! what a wife and kimpanion, 'ith them looks, and them ways, and them niggers, and warous prop'ty, she would make! Think she have a notion or idees that way, Mr. Hines?"

"That question oversize my information,

she won't hizitate. A superfine female! No man, sir,—I say it bold and above-bode,—no man that's either too old or wo' out ought to, dares n't to offer hisself to be a party o' the second part in Miss Sally Cash expeermunts, or whatsomever she mind to name 'em."

Interesting to all the neighbors, most especially to Mr. Hines, became movements made by the two widowers, their daughters, and Miss Cash. For Mr. Hines, as was believed, hoped to

"THAT QUESTION OVERSIZE MY INFORMATION, SIR."

sir; but I have heard her say that her mind been running on a expeermunt, as she call it, and she don't know what she might do if the right man was to come, and he did n't prove to be too old and wore out."

"Umph, humph! I suppose not, of course; young female, like her. Yaas. I'm told she drap in your stow right freckwent these days. When she come next time, Mr. Hines, you may 'member my respects, and tell her anything I can help her in any her business of all kind, my requestes is, and also is my desires,

be able to win for himself that one of the young ladies whose father Miss Cash would accept eventually. The coolness and reserve that had risen between the cousins neither Miss Cash nor the gentlemen objected to. Indéed, there was no doubt that every one of the six felt that the hand that he or she held had to be played with utmost discretion. Miss Cash manifested great respect for the late serious conversations of Mr. Tuggle, and she laughed consumedly at the new jokes of Mr. Hooks. Nobody doubted that she could choose be-

tween the two; and each of these, conscious that the other was his equal, or nearly so, advanced with slowness and caution. As for the young ladies, each convinced that the other was working against her wishes and interests in the case of Miss Cash, and perhaps remotely in that of Mr. Hines, they became reserved to the degree that, not visiting each other at all, whenever they happened to meet they spoke, but nothing more. With entire coolness Miss Cash seemed to contemplate their cross-firing, and not infrequently she indulged in partly confidential chat about it with Mr. Hines at the store, or at her house, to which, in answer to her kind invitations, he sometimes went.

"Yes," Miss Cash said one day, "ef you have ever heard two girls praise up fathers that 's not their'n, it 's them. Look like they don't count their own fathers no shakes at all hardly, but it 's they of the other. I agrees with both what they say; because both their parents is excellent good men, and them fine, good girls."

"People say, Miss Sally," here Mr. Hines ventured to remark, "that in all prob'ility the Cash plantation will jind in either with the Hooks or the Tuggle."

"They all three jinds now already, Mr. Hines; but I know what your meanin's is in your mischievious. It take more than one consents for sech as that, Mr. Hines; which a young lady like me, that have no expeunce, even ef she do think sometimes in a iduil hour of makin' sech a expeermunt, yit she can't but have her doubts, I may even say she can't but be jubous, and in fact downright hizitate on sech a dilicate, and I might actuil' say skeary kinclusion she might have on the subjects of our present remarks. But, Mr. Hines,"—and now she smiled distantly and pleasantly,— "a person might have more than thes one expeermunt in her mind-eye, as the preacher say, and when the time come, you 'll see ef Sairey Cash, which people in gener'l call her Sally, but you 'll see ef she 's the young lady she took herself, ef she understan' herself, and she think she do. For, somehow, I talk with you freer than I talk with some. But I actuil' do want to see them girls do well, and for whoever gets 'em to not have to wait for prop'ty as I am now thankful that I ain't hendered from the havin' of comforts, and even lujuries when I want 'em."

Noticing his interest in the conversation, she continued to talk at much length, saying, among other things:

"I 'm older than them girls, Mr. Hines,—that is, I 'm some older; and I know them fathers better than they do, and I know them better than their fathers do. Both them girls

MR. MATTHEW TUGGLE.

think they know me perfic', and their fathers has their sispicions about me, which their sispicions is pine blank defernt. It would all be ruther funny if my mind *were* made up, which it ain't, and it look hard a loned female person have nobody to go to for advices. But ef you name those few remarks to any or every body, Mr. Hines, I shall never forgive you while the breath is in my body, as in the good healths I always enjoys, I should hope would be for many a years yit to come."

The neighbors at last were growing impatient at the delay of a consummation the more eagerly looked for because of its uncertainty.

"It look like nip and tuck betwix' Sing'ton and Matthy," said old Mr. Pate several times, "and ut 'pear to me like they both of 'em a-expectin' and a-countin' on officiatin' Sally, so to speak. Sing'ton—well, I don't 'member as I ever see a yearlin' boy livelier and jokier. I tell him sometimes don't look out they 'll fetch him up in the church about his world'y ways. But sher! that jes only make him go on yit more livelier. As for Matthy, he ain't

OLD MR. PATE.

peart and gaily as he used to wus; but he look solid and studdy as a jedge that have the case done made up in his head, and he ain't a-pesterin' hisself about how much them lawyers palavvers, and jaws, and jowers 'ith one 'nother and the jury. I jokes Sally too sometimes, and ask her which she goin' take; but she smile, and say them that astes the fewest queschins gits told the fewest lies. But — and you may take my words for it — people ain't a-goin' to be kept waitin' much longer, to my opinions. Sing'ton and Matthy, both of 'em, is men that when they means business they bound to bring it to a head, and see if there any profic in it or not. You mind what I tell you."

VI.

MISS CASH gave a party.

By candlelight the guests arrived. The hostess shone in a white frock whose flounces, furbelows, and gathers — if these be their names — I feel it to be vain at my time of life to undertake to describe. Her hair, I admit, was red; but her cheeks — well, she would have contended, if necessary, that their color was her business; and certain it is, that for every stick of cinnamon that may have been used by her for any purpose under the sun the hard cash had been paid down on Mr. Hines's counter and no grumbling.

Whoever had supposed that Mr. Hooks

would have declined an invitation to a party at that house, even when it was understood that there was to be dancing, knew not the man. That very evening he had ridden down to the store and purchased not only the shiniest pair of silk stockings that could be found in the whole store, and the sleekest pair of pumps, but the longest, widest, stripedest silk cravat; and the latter he had Mr. Hines to tie around his neck, enjoining him to come as nigh the Augusta knot as was possible in a provincial region so remote from that great metropolis.

"Them feet and them legs," contemplating these interesting objects, he remarked at the party to several ladies and gentlemen, as if imparting a pleasant secret—"them legs and them feet 'pear like they forgot tell here lately what they made fur; but my intenchins is, before they git much older, to convince 'em o' their ric'lection."

He sat by Susan Ann, and Mr. Tuggle by Emeline; and it was evident that each of these young ladies was intent upon exhibiting before Miss Cash her own especial knight to the best possible advantage.

To one who loves the sound of the fiddle, there is something in its voice that imparts an exhilaration seldom coming from any other music. In the breast of Mr. Hooks on the present occasion that emotion was perhaps the more pronounced because of several years' suppression. When Morris, a negro man belonging to the rich Mr. Parkinson, was called in, even while putting his instrument in tune, the eyes of Mr. Hooks were lit up into fiery brilliancy; his face quivered with almost angry smiles; and he had to breathe, and that hotly, through his nostrils alone; while his elevated mouth was puckered in every possible approach to a point, in order to hold within its accumulating waters.

It was pleasant to everybody to notice how well Mr. Hines looked and behaved. On the whole he was better dressed—that is, more stylishly and perhaps expensively—than any other gentleman present. But of course he had been to Augusta far more often than anybody else there; and besides, being his own buyer as well as seller, he could afford to dress as he pleased. Having confessed to Miss Cash that his early education in dancing had been neglected, she, with kind thoughtfulness for the embarrassment that he must feel otherwise, deputed him to assist in the entertainment of her guests, in which office he deported himself with a satisfaction that hardly could have been greater if it had been his own house.

"Choose pardners!" at length cried Morris in the commanding, menacing tone that only negro-fiddlers ever knew fully how to employ.

Instantly rose Mr. Hooks, and, violently seizing the hand of Susan Ann, led her forth. Mr. Tuggle glanced at Emeline, then lowered his head far down, as if to be more able thus to control his feelings. Emeline did the same.

The surprise manifested by the whole company at the prompt rise of Mr. Hooks and his march to the head of the cotillon was feeble compared with that experienced when they witnessed what he could do in that line. At first, as the figures were called, he moved with measured dignity, his long arms with deliberate exactitude describing immense, majestic arcs, both in the preliminaries of rotary movements and in their consummation. Susan Ann was a noted dancer, and the sight of her agility and grace, together with her appreciative words, inspired her partner to repetition of the noblest exploits of his youth.

"You are the best partner I ever danced with," she whispered.

"Laws, girl!" he answered, indifferent, "wait tell I git warm, and come down 'ith a few o' my double dimmersimmerquibbers."

"Give them some," she replied, looking at Miss Cash, whom she saw already running over with admiration.

"Sashay W' all!"

When came the turn of Mr. Hooks to obey the command, if ever a pair of human legs exhibited suppleness, sprightliness, precision of calculation, the faculty to intertwine and outertwine, to wrap themselves around each other when high lifted from the floor, unwrap themselves at the instant of return, and afterwards to reverse these apparently reckless spires, then surely was the time. There were moments when all, including Susan Ann, evinced apprehension that in one of these audacious exaltations a man so tall and slender, so long disused to such exercise, might lose his balance and fall bodily, perchance head-foremost, in the arena. But no! The arm of the daring vaulter, sometimes both, sometimes alternately extended, sometimes pointing to the zenith, sometimes to the horizon, sometimes at various angles intermediate to horizon and zenith, kept him true as any gyroscope. His countenance the while wore a serious, even threatening, aspect. When Morris, panting and dripping with sweat, gave the last shrieking note and called, "Honors to pardners," the hero descended heavily on one foot, and, extending the other, rested its toes easily on their extreme points, and while one hand hung in the direction towards these, the other's forefinger, far above all heads, pointed to the heavens. Amidst the applause that rose irresistibly, after conducting Susan Ann to her seat, not taking that by her side, he promenaded around the room for some minutes suffering

himself to be admired. Then, pausing in front of his rival, he said :

"Matthy, ain't you goin' to j'in in the eg-zitin' spote Miss Sally have powided so liber'l' fur the enj'yments and 'ospital'ties of us all?"

"Now that," on his way home said Mr. Pate, "it did n't look like quite fa'r in Sing'ton, him a-knowin' Matthy, 'ith his duck-legs, were onpossible to foller him in them climbin's, the oudaciousest I ever 'spected to live to see. Yit

MISS SALLY CASH.

Matthy not a man people can skeer. He look like he know what he were about, and he smile and answer calm, he have made up his minds to quit dancin'."

VII.

DURING the last wane of the evening, somewhat of abstraction, not wholly unattended by embarrassment, began to be noticeable in the carriage of Miss Cash. She was observed to whisper several times alternately with Mr.

Hooks and Mr. Tuggle, who nodded respectfully. As the party was breaking up, Mr. Pate, apparently reluctant to leave, in view of the briefness of human life, especially the fewness of occasions similar to the present that were likely to occur during his own briefer remnant, full of good wishes as of things good to eat and to drink, felt that he ought not to go away without a few valedictory words.

"Sally," he said, with moistened eyes, "a better party, and a more liber'l' powided, I never should hope to put on my Sunday close and go too; no, never endurin' what little balance o' time they is left me to be 'ith you all, which I hope the good Lord, ef he spar' my life, he 'll find he hain't so very many better friends than what I 've tried to be. And I 'll say for Sing'ton Hooks and Matthy Tuggle, I 've knewed 'em from babies, and their ekals for a marry'n' female person to make their ch'ice betwix', other people may know, I don't. And, tell the truth, I don't 'member as ever I have wish', before here lately, they was more 'n one Sally Cash to diwvide betwix' 'em — boys, as I call 'em, compar'd to me. And my advices is for you not to be forever and deternal a-hizitatin' about a marter which it ain't possible no way to make any big mistakes. Because them boys is, both of 'em, business boys, and natchel' speakin' they don't want to be al'ays hilt betwix' hawk and buzzard in this kind o' style. Good-bye; good-bye. Good-bye, Sing'ton; I did not know you was ekal to sech awful performance. Good-bye, Matthy; you done right not follerin' Sing'ton on that line; but a dignifieder behavior than you I would never wish to go to nobody's party. And it's a pleasure to see how honer'ble you and Sing'ton has been in the whole case. And my ricommends to both you boys, is to keep on standin' squar' up to the rack tell the fodder fall; and when she do, let him that 's disapp'inted, ef he can't be satisfied, let him least-ways try to git riconciled, and then gether up his fishin'-pole, his hook and line, and his bait-gourd, and move to some other hole in the mill-pond; because you both got sense enough to know that the good Lord ain't one that make jes' one lone fish by itself. Good-bye, Sing'ton; good-bye, Matthy; good-bye, all."

When all had departed except the Hookses and the Tuggles, who were requested to remain for a few minutes, the gentlemen were asked to take seats on one side of the room and Emeline and Susan Ann on the opposite, while Miss Cash took her position, from which she could command, in flank, the view of all.

After several modest, significant coughs, she began :

"I ast you all to stay behind because I

wanted to make these few, feeble, and interesting remarks about me and you all. You are all my neighbors, and I've tried to be you-all's friends, and none of you has knew the extents. I ain't a-blamin' none of you; because I never yit has told you, nary one. And I never told not even myself, not untell here lately, because not untell here lately did I know the ewents and how they would all turns out; and I has never be'n so much conwincend in my own minds that the good Lord know more about me than I do about myself than I be'n thes here lately. Howbe'ever, let me and them keep behind for the present time a-bein'.

"Mr. Hooks, you and Susan Ann has be'n a-thinkin' that me and Mr. Tuggle was a-goin' to nunite in the banes of mattermony. And then again, Mr. Tuggle, you and Emeline has be'n a-countin' on the same 'ith me and Mr. Hooks, which I needs not say you has all be'n mistakened, but in a deffer'nt and warous way! In nary case have I let on ef it was to be, or not so: one reason, because a lady owe it to herself not to be kickin' before she have be'n spurred, and not to say yea nor nay tell she 's ast; which both of you all may n't be surprised hain't never be'n done by none of them gent'men here on the present occasion in this very same room. And I am thankful they did n't. Because I am a person that have my own p'int's o' views and my own ch'ices o' kimpanions like other people, and, not ef I know myself, would it be my desires to pass for the mothers of childern which is not my ownd; ner not their step-mothers even, ef some has be'n a-sispicionin' to the kin-traries."

Looks of surprise went around at the close of this paragraph. Slightly shifting her position, the speaker resumed:

"And yit, both you men has be'n a-co'tin' close and heavy, a'most amejiant when their wife deparched from the famblies in their charges, and, not to save my life, could I turn my backs when both o' you ast me to help you out; and it's because, I sometimes be'n a-supposenin', they is or they may be somethin' in the a'r that, in sech times, make sech things interestin' and ketchin', even to a moduest female like me."

During the bashful pause ensuing here, the gentlemen looked at each other inquiringly, and the young ladies, moving their chairs some space farther apart, turned and faced alternately the opposite walls.

"Yes, sirs, and yes, ma'ams, you girls; you knewed yourselves, but you knewed not t' other couple; and nary one, nor nary couple betwix' you, has knewed Sally Cash, what little time may be left she may call, or t' other people may call, her by them fambliliar names. Yit, before I come as fur downd as myself,

I want to settle up the expeerinunts I be'n a-makin' a clean a outside o' Sally Cash; and which I 'll begin by askin' of you, Mr. Hooks, a certing queschin, and that is, is you willin' or is you not, to give Emeline to Mr. Tuggle?"

Here Susan Ann turned and stared at Emeline as if she were a ghost, while Emeline kept her eyes upon the wall, studying it curiously, as if it were covered all over with frescoes from the most ancient masters.

"Well; now, Sally," began Mr. Hooks in much calmness, considering the situation, "the queschin—it ketch me by surprises, and—I may say—"

"That you 'll have to hear," Miss Cash interrupted, "what Mr. Tuggle 'll say to the queschin I'm a-goin' to put to him in the amejiant spurs o' the awful an' interestin' minutes; and which, that is, Mr. Tuggle, will you let Mr. Hooks have Susan Ann? There 's the whole case betwix' you all."

"Jes so; perpendic'lar; the same as a gatepost," said Mr. Hooks, with deliberate yet utmost emphasis.

Then Emeline, turning, sought the face of Susan Ann, which by this time had become absorbed in the contemplation of the masterpieces on *her* wall. In another moment they were weeping, hugged in each other's arms.

"Come, come; set down, set down," said Miss Cash, "and let me git through 'ith the rest o' my tale. It won't be so very much to you, but it 's everything to me."

Then the native blood rose even through the cinnamon, and a something much like beauty overspread her face.

"When I first begun to talk about makin' a' expeerment of the gittin' of married myself, it were mostly iduil talk. But somehow, or somehow else, I don't know as I may never know how sech things comes about, yit I got to ruther love to let my mind runned on the interestin' subjects. And then, it come to me, and I begin to think, mayby,—who knows?—ef it were the will of the good Lord, that him, a-knowin' how I have always be'n a orphin and had to work hard to help take keer of myself, and that a'most every sence I were a baby—that, I say, mayby it were His will for me not to git old thes by myself, and never have any pleasant siciety, like other people, o' them to keer anything about, exceptin' o' them might natchil' expects to git whut prop'ty I got, and then a possible a-wantin' me out o' the way before my time come to deparch, like poor Betsy Tuggle, and poor Malviny Hooks, good friends as they wus to me, and me to them. And not that Abom Grice never even hint sech a thing, but he have freckwent told me that it were my very first juty to look out

"AFTER A DECENT MOMENT STEPPED FORTH MR. ABNER HINES."

for myself. Yit, I know, because I have saw what it is for women to git old thes by their-selves, 'ith no husband, and no childern, and no nobody o' the kinds; and even when their kinfolks may n't want 'em to die, they sispicions 'em of it. And so I thought mayby it were the will o' the good Lord to hender sech as that to me, him a-knowin' how I've had to scuffle and baffle every sence I were a little bit of a orphin child, and ef anybody ever loved me thes for myself, the good Lord know I don't know who it was—*untell now*. And—O Mr. Hooks, don't ask me yit, not quite yit! I'll acknowledge everytling, and then tell you what I want you to do, when I can git a little more compoged in my mind."

Rising, she went to a table whereon were tumblers and a pitcher of water. As she lifted the latter with tottering hand, Mr. Hooks went briskly and took it just as it would have dropped. He poured a glass that with difficulty she drank; then, reseating herself, continued:

"When I see you two men a-courtin' of them girls, it got to be that interestin' to me, that I got so I could n't go to sleep o' nights, tell away yonder a'most midnight; a thes a-layin' and a-thinkin' ef you two men, that have be'n young and happy before, can be young and happy ag'in, why not me, thes one time, that have al'ays be'n a loned female by myself."

She paused, and the tears streamed from her eyes. Emeline and Susan Ann wept in genuine sympathy, and the eyes of Mr. Tugle were very moist. Mr. Hooks looked down at his pumps and silk stockings, and, perhaps because he recognized the incongruity between what they had been doing so lately and any degree of sadness which he might express, simply rose from his chair.

"Set down, Mr. Hooks; set down. I'm a'most thoo. But, and, I tell you now, all of you, I'd of died before I'd of even peached sech a thing to ary man person that ever pre-ambulated on top o' the ground, first. And

when one o' that same seck of people name to me the very subjects I be'n a-thinkin' and a actuil' a-dreamin' about, ef it did n't 'pears like to me the good Lord sent him a-purpose."

With hand yet trembling, she took from her bosom a marriage-license, and, handing it to Mr. Hooks, said:

"There 's a paper for you, Mr. Hooks, which people is now ready and a-waitin' for you to 'tend to it."

Turning her face towards the dining-room, she called aloud:

"Mimy, you may come in, and the balance of 'em."

The door opened, Mimy and the other negroes, having on every item of Sunday clothes that that plantation had on hand, filed in and took position near the walls. After a decent

moment, a-tiptoe, his arm already curved to receive that of his bride, stepped forth Mr. Abner Hines.

"And I do believe, on my soul," Mr. Hooks said some time afterwards, "that arfter I have jinded them two together, hard and fast, a'cordin' to law *and* gospul, that it were in me to make prob'ble the biggest, everlastin'est speech I ever spread myself before a augence; but the fact were, everybody got to laughin' and cryin' so they drowned my woices. Ah, well! it were a ruther egzitin' time all thoo. But everything have swaged down peaceable. The breth'en they forgive me for dancin', when Susan Ann give in the pooty expeunce she told, and it were give' out I would n't do so no more."

R. M. Johnston.

THE KNIGHT IN SILVER MAIL.

SHE left the needle in the rose
And put her broidery by,
And leaning from her casement tall
She heard the owlets cry.
The purple sky was thick with stars,
And in the moonlight pale
She saw come riding from the wood
A knight in silver mail.

His plume was like the snowy foam
That wreathes the roaring tide,
The glory of his golden locks
His helmet could not hide.
She took the lily from her breast
(Like hers, its beauty frail),
And dropped it as he rode beneath —
The knight in silver mail.

About her gown of crimson silk
She drew a mantle dark.
She saw the stately castle-towers
Uprising from the park,
And on the lake the mated swans,
Asleep in shadow, sail,
But left it all to follow him,
The knight in silver mail.

"Oh, I would see thy face, my love,
Oh, I would see thy face!
Why dost thou keep thy visor down?
It is a lonely place."
His voice was like the hollow reeds
That rustle in the gale:
"'T is lonelier in my castle," said
The knight in silver mail.

Hè let his steed go riderless,
He took her by the hand
And led her over brake and brier
Into a lonesome land.
"Oh, are they headstones all a-row
That glimmer in the vale?"
"My castle-walls are white," replied
The knight in silver mail.

"So close unto thy castle-doors
Why buryest thou the dead?"
"For ten long years I've slept with them:
Ah, welcome home!" he said.
He clasped her dainty waist around,
And in the moonlight pale
Upraised his visor, and she saw
The knight in silver mail.

At dawn her father's men-at-arms
Went searching everywhere,
And found her with the churchyard dews
A-sparkle in her hair.
And lo! a sight to make the best
And bravest of them quail,
Beside her in the tangled grass,
A skeleton in mail.

Minna Irving.

ABRAHAM LINCOLN: A HISTORY.*

TENNESSEE AND KENTUCKY.

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

HALLECK.

IN sending General Hunter to relieve Frémont, the President did not intend that he should remain in charge of the Department of the West. Out of its vast extent the Department of Kansas was created a few days afterward, embracing the State of Kansas, the Indian Territory, and the Territories of Nebraska, Colorado, and Dakota, with headquarters at Fort Leavenworth, and Hunter was transferred to its command. General Halleck was assigned to the Department of the Missouri, embracing the States of Missouri, Iowa, Minnesota, Wisconsin, Illinois, Arkansas, and that portion of Kentucky west of the Cumberland River.

Henry Wager Halleck was born in Oneida County, New York, January 15, 1815. Educated at Union College, he entered the military academy at West Point, where he graduated third in a class of thirty-one, and was made second lieutenant of engineers July 1, 1839. While yet a cadet he was employed at the academy as assistant professor of engineering. From the first he devoted himself with constant industry to the more serious studies of his profession. He had attained a first lieutenantcy when the Mexican war broke out, and was sent to the Pacific coast. Valuable services in the military and naval operations prosecuted there secured him the brevet of captain from May 1, 1847. On the conquest of California by the United States forces, he took part in the political organization of the new State, first as Secretary of State under the military governors, and afterward as leading member of the convention which framed the constitution under which California was admitted to the Union.

He remained in the army and in charge of various engineering duties on the Pacific coast until August 1, 1854, having been meanwhile promoted captain of engineers. At that date he resigned his commission to engage in civil pursuits. He became a member of a law firm, and was also interested in mines and railroads,

when the outbreak of the rebellion called him again into the military service of the Government. He was not only practically accomplished in his profession as a soldier, but also distinguished as a writer on military art and science. Halleck's high qualifications were well understood and appreciated by General Scott, at whose suggestion he was appointed a major-general in the regular army to date from August 19, 1861, with orders to report himself at army headquarters in Washington. A phrase in one of Scott's letters, setting forth McClellan's disregard for his authority, creates the inference that the old general intended that Halleck should succeed him in chief command. But when the latter reached Washington, the confusion and disasters in the Department of the West were at their culmination, and urgent necessity required him to be sent thither to succeed Frémont.

General Halleck arrived at St. Louis on November 18, 1861, and assumed command on the 19th. His written instructions stated forcibly the reforms he was expected to bring about, and his earlier reports indicate that his difficulties had not been overstated—irregularities in contracts, great confusion in organization, everywhere a want of arms and supplies, absence of routine and discipline. Added to this was reported danger from the enemy. He telegraphs under date of November 29:

I am satisfied that the enemy is operating in and against this State with a much larger force than was supposed when I left Washington, and also that a general insurrection is organizing in the counties near the Missouri River, between Boonville and Saint Joseph. A desperate effort will be made to supply and winter their troops in this State, so as to spare their own resources for a summer campaign.

An invasion was indeed in contemplation, but rumor had magnified its available strength. General Price had, since the battle of Lexington, lingered in south-western Missouri, and was once more preparing for a northward march. His method of campaigning was peculiar, and needed only the minimum of organization and preparation. His troops were made up mainly of young, reckless, hardy Missourians, to whom a campaign was

* Copyright by J. G. Nicolay and John Hay, 1886. All rights reserved.

an adventure of pastime and excitement, and who brought, each man, his own horse, gun, and indispensable equipments and clothing. The usual burdens of an army commissariat and transportation were of little moment to these partisans, who started up as if by magic from every farm and thicket, and gathered their supplies wherever they went. To quote the language of one of the Missouri rebel leaders: "Our forces, to combat or cut them off, would require only a haversack to where the enemy would require a wagon." The evil of the system was, that such forces vanished quite as rapidly as they appeared. The enthusiastic squads with which Price had won his victory at Lexington were scattered among their homes and haunts. The first step of a campaign, therefore, involved the gathering of a new army, and this proved not so easy in the opening storms of winter as it had in the fine midsummer weather. On the 26th of November, 1861, Price issued a call for 50,000 men. The language of his proclamation, however, breathed more of despair than of confidence. He reminded his adherents that only one in forty had answered to the former call, and that "Boys and small property-holders have in main fought the battles for the protection of your property." He repeated many times, with emphasis, "I must have 50,000 men." * His prospects were far from encouraging. McCulloch, in a mood of stubborn disagreement, was withdrawing his army to Arkansas, where he went into winter quarters. Later on, when Price formally requested his coöperation, McCulloch as formally refused. For the moment the Confederate cause in south-western Missouri was languishing. Governor Jackson made a show of keeping it alive by calling the fugitive remnant of his rebel legislature together at Neosho, and with the help of his sole official relic—the purloined State seal—enacting the well-worn farce of passing a secession ordinance, and making a military league with the Confederate States.

The Confederate Congress at Richmond responded to the sham with an act to admit Missouri to the Confederacy. An act of more promise at least, appropriating a million dollars to aid the Confederate cause in that State, had been passed in the preceding August. Such small installment of this fund, however, as was transmitted failed even to pay the soldiers, who for their long service had not as yet received a penny. In return the Richmond authorities asked the transfer of Missouri troops to the Confederate service; but with this request the rebel Missouri leaders

were unable immediately to comply. When, under date of December 30, 1861, Governor Jackson complained of neglect and once more urged that Price be made commander in Missouri, Jefferson Davis responded sarcastically that not a regiment had been tendered, and that he could not appoint a general before he had troops for him. † From all these causes Price's projected winter campaign failed, and he attributed the failure to McCulloch's refusal to help him. ‡

The second part of the rebel programme in Missouri, that of raising an insurrection north of the Missouri River, proved more effective. Halleck was scarcely in command when the stir and agitation of depredations and the burning of bridges, by small squads of secessionists in disguise, were reported from various counties of northern Missouri. Federal detachments went promptly in pursuit, and the perpetrators as usual disappeared, only however to break out with fresh outrages when quiet and safety had apparently been restored. It was soon evident that this was not merely a manifestation of neighborhood disloyalty, but that it was part of a deliberate system instigated by the principal rebel leaders. "Do you intend to regard men," wrote Price to Halleck, January 12, 1862, "whom I have specially dispatched to destroy roads, burn bridges, tear up culverts, etc., as amenable to an enemy's court-martial, or will you have them to be tried as usual, by the proper authorities, according to the statutes of the State?" § Halleck, who had placed the State under martial law, to enable him to deal more effectually with this class of offenders, stated his authority and his determination, with distinct emphasis, in his reply of January 22, 1862:

You must be aware, general, that no orders of yours can save from punishment spies, marauders, robbers, incendiaries, guerrilla bands, etc., who violate the laws of war. You cannot give immunity to crime. But let us fully understand each other on this point. If you send armed forces, wearing the garb of soldiers and duly organized and enrolled as legitimate belligerents, to destroy railroads, bridges, etc., as a military act, we shall kill them, if possible, in open warfare; or, if we capture them, we shall treat them as prisoners of war. But it is well understood that you have sent numbers of your adherents, in the garb of peaceful citizens and under false pretenses, through our lines into northern Missouri, to rob and destroy the property of Union men and to burn and destroy railroad bridges, thus endangering the lives of thousands, and this, too, without any military necessity or possible military advantage. Moreover, peaceful citizens of Missouri, quietly working on their farms, have been instigated by your emissaries to take up arms as insurgents, and to rob and plunder, and to commit arson and murder. They do not even act under the garb of soldiers, but under false pretenses and in the

* War Records.

§ Price to Halleck. Ibid.

guise of peaceful citizens. You certainly will not pretend that men guilty of such crimes, although "specially appointed and instructed by you," are entitled to the rights and immunities of ordinary prisoners of war.

One important effect which Price hoped to produce by the guerrilla rising he was instigating was to fill his army with recruits. "The most populous and truest counties of the State," he wrote, "lie upon or north of the Missouri River. . . . I sent a detachment of 1100 men to Lexington, which after remaining only a part of one day gathered together about 2500 recruits, and escorted them in safety to me at Osceola." His statement was partly correct, but other causes contributed both to this partial success and the partial defeat that immediately followed. Just at the time this expedition went to Lexington, the various Federal detachments north of the Missouri River were engaged in driving a number of secession guerrilla bands southward across that stream. Halleck was directing the joint movements of the Union troops, and had stationed detachments of Pope's forces south of the Missouri River, with the design of intercepting and capturing the fugitive bands. A slight failure of some of the reports to reach him disconcerted and partly frustrated his design. The earliest guerrilla parties which crossed at and near Lexington escaped and made their way to Price, but the later ones were intercepted and captured as Halleck had planned. Pope reports, September 19:

Colonel Davis came upon the enemy near Milford late this afternoon, and having driven in his pickets assailed him in force. A brisk skirmish ensued, when the enemy, finding himself surrounded and cut off, surrendered at discretion. One thousand three hundred prisoners, including 3 colonels and 17 captains, 1000 stand of arms, 1000 horses, 65 wagons, tents, baggage, and supplies have fallen into our hands. Our loss is 2 killed and 8 wounded.*

On the next day he found his capture was still larger, as he telegraphs: "Just arrived here. Troops much embarrassed with nearly 2000 prisoners and great quantity of captured property."

In anticipation of the capture or dispersion of these north-western detachments of rebels, Halleck had directed the collection of an army at and about Rolla, with the view to move in force against Price. General Samuel R. Curtis was, on December 25, assigned to the command of the Union troops to operate in the south-western district of Missouri. Some 10,000 men were gathered to form his column; and had he known Price's actual condition, the possibility of a short and successful campaign was before him. But the situation

was also one of difficulty. The railroad ended at Rolla; Springfield, the supposed location of Price's camp, was a hundred and twenty miles to the south-west, with bad roads, through a mountainous country. Rebel sentiment and sympathy were strong throughout the whole region, and the favoring surroundings enabled Price to conceal his designs and magnify his numbers. Rumors came that he intended to fight at Springfield, and the estimates of his strength varied from 20,000 to 40,000. The greatest obstacle to a pursuit was the severity of the winter weather; nevertheless the Union soldiers bore their privations with admirable patience and fortitude, and Halleck urged a continuance of the movement through every hindrance and discouragement. He writes to McClellan, January 14, 1862:

I have ordered General Curtis to move forward, with all his infantry and artillery. His force will not be less than 12,000. The enemy is reported to have between 35 and 40 guns. General Curtis has only 24; but I send him 6 pieces to-morrow, and will send 6 more in a few days. I also propose placing a strong reserve at Rolla, which can be sent forward if necessary. The weather is intensely cold, and the troops, supplied as they are with very inferior clothing, blankets, and tents, must suffer greatly in a winter campaign, and yet I see no way of avoiding it. Unless Price is driven from the State, insurrections will continually occur in all the central and northern counties, so as to prevent the withdrawal of our troops.

A few days later (January 18) Halleck wrote to Curtis that he was about to reënforce him with an entire division from Pope's army, increasing his strength to fifteen thousand; that he would send him mittens for his soldiers:

Get as many hand-mills as you can for grinding corn. . . . Take the bull by the horns. I will back you in such forced requisitions when they become necessary for supplying the forces. We must have no failure in this movement against Price. It must be the last.

And once more, on January 27, he repeated his urgent admonition:

There is a strong pressure on us for troops, and all that are not absolutely necessary here must go elsewhere. Pope's command is entirely broken up; 4000 in Davis's reserve and 6000 ordered to Cairo. Push on as rapidly as possible and end the matter with Price.

This trying winter campaign led by General Curtis, though successful in the end, did not terminate so quickly as General Halleck had hoped. Leaving the heroic Western soldiers camping and scouting in the snows and cutting winds of the bleak Missouri hills and prairies, attention must be called to other incidents in the Department of the Missouri. While Halleck was gratifying the Government and the Northern public with the ability and

* Pope to Halleck. War Records.

vigor of his measures, one point of his administration had excited a wide-spread dissatisfaction and vehement criticism. His military instincts and methods were so thorough that they caused him to treat too lightly the political aspects of the great conflict in which he was directing so large a share. Frémont's treatment of the slavery question had been too radical; Halleck's now became too conservative. It is not probable that this grew out of his mere wish to avoid the error of his predecessor, but out of his own personal conviction that the issue must be entirely eliminated from the military problem. He had noted the difficulties and discussions growing out of the dealings of the army with fugitive slaves, and hoping to rid himself of a perpetual dilemma, one of his first acts after assuming command was to issue his famous General Order No. 3 (November 20, 1861), the first paragraph of which ran as follows:

It has been represented that important information respecting the numbers and condition of our forces is conveyed to the enemy by means of fugitive slaves who are admitted within our lines. In order to remedy this evil, it is directed that no such persons be hereafter permitted to enter the lines of any camp or of any forces on the march, and that any now within such lines be immediately excluded therefrom.*

This language brought upon him the indignant protest of the combined antislavery sentiment of the North. He was berated in newspapers and denounced in Congress, and the violence of public condemnation threatened seriously to impair his military usefulness. He had indeed gone too far. The country felt, and the army knew, that so far from being generally true that negroes carried valuable information to the enemy, the very reverse was the rule, and that the "contrabands" in reality constituted one of the most important and reliable sources of knowledge to the Union commanders in the various fields, which later in the war came to be jocosely designated as the "grape-vine telegraph." Halleck soon found himself put on the defensive, and wrote an explanatory letter to the newspapers. A little later he took occasion officially to define his intention:

The object of these orders is to prevent any person in the army from acting in the capacity of negro-catcher or negro-stealer. The relation between the slave and his master, or pretended master, is not a matter to be determined by military officers, except in the single case provided for by Congress. This matter in all other cases must be decided by the civil authorities. One object in keeping fugitive slaves out of our camp is to keep clear of all such questions. . . . Orders No. 3 do not apply to the authorized private servants of officers nor the negroes employed by proper author-

ity in the camps. It applies only to fugitive slaves. The prohibition to admit them within our lines does not prevent the exercise of all proper offices of humanity in giving them food and clothing outside where such offices are necessary to prevent suffering.†

It will be remembered that the Missouri State Convention in the month of July appointed and inaugurated a provisional State government. This action was merely designed to supply a temporary executive authority until the people could elect new loyal State officers, which election was ordered to be held on the first Monday in November. The convention also, when it finished the work of its summer session, adjourned to meet on the third Monday in December, 1861, but political and military affairs remained in so unsettled a condition during the whole autumn that anything like effective popular action was impracticable. The convention was therefore called together in a third session at an earlier date (October 11, 1861), when it wisely adopted an ordinance postponing the State election for the period of one year, and for continuing the provisional government in office until their successors should be duly appointed.

With his tenure of power thus prolonged, Governor Gamble, also by direction of the convention, proposed to the President to raise a special force of Missouri State militia for service within the State during the war there, but to act with the United States troops in military operations within the State or when necessary to its defense. President Lincoln accepted the plan upon the condition that whatever United States officer might be in command of the Department of the West should also be commissioned by the governor to command the Missouri State militia; and that if the President changed the former, the governor should make the corresponding change, in order that any conflict of authority or of military plans might be avoided. This agreement was entered into between President Lincoln and Governor Gamble on November 6, and on November 27 General Schofield received orders from Halleck to raise, organize, and command this special militia corps. The plan was attended with reasonable success, and by the 15th of April, 1862, General Schofield reports, "an active efficient force of 13,800 men was placed in the field," nearly all of cavalry.

The raising and organizing of this force, during the winter and spring of 1861-62, produced a certain degree of local military activity just at the season when the partisan and guerrilla operations of rebel sympathizers were necessarily impeded or wholly suspended by severe weather; and this, joined with the vigorous administration of General Hal-

leck, and the fact that Curtis was chasing the army of Price out of south-western Missouri, gave a delusive appearance of quiet and order throughout the State. We shall see how this security was rudely disturbed during the summer of 1862 by local efforts and uprisings, though the rebels were not able to bring about any formidable campaign of invasion, and Mis-

tion became, in the public estimation, rather a sign of suspicion than an assurance of honesty and good faith. It grew into one of the standing jests of the camps that when a Union soldier found a rattlesnake, his comrades would instantly propose with mock gravity, "Administer the oath to him, boys, and let him go."

souri as a whole remained immovable in her military and political adherence to the Union.

With the view still further to facilitate the restoration of public peace, the State convention at the same October (1861) session, extended amnesty to repentant rebels in an ordinance which provided that any person who would make and file a written oath to support the Federal and State governments, declaring that he would not take up arms against the United States, or the provisional government of Missouri, nor give aid and comfort to their enemies during the present civil war, should be exempt from arrest and punishment for previous rebellion.

Many persons doubtless took this oath and kept it with sincere faith. But it seems no less certain that many others who also took it so persistently violated both its spirit and letter as to render it practically of no service as an external test of allegiance to the Union. In the years of local hatred and strife which ensued, oaths were so recklessly taken and so willfully violated that the ceremony of adjura-

THE TENNESSEE LINE.

In the State of Kentucky the long game of political intrigue came to an end as the autumn of 1861 approached. By a change almost as sudden as a stage transformation-scene, the beginning of September brought a general military activity and a state of qualified civil war. This change grew naturally out of the military condition, which was no longer compatible with the uncertain and expectant attitude the State had hitherto maintained. The notes of preparation for Frémont's campaign down the Mississippi could not be ignored. Cairo had become a great military post, giving the Federal forces who held it a strategical advantage both for defense and offense against which the Confederates had no corresponding foothold on the great river. The first defensive work was Fort Pillow, 215 miles below, armed with only twelve 32-pounders. To oppose a more formidable resistance to Frémont's descent was of vital importance, which General

Polk's West Point education enabled him to realize.

But the Mississippi, with its generally level banks, afforded relatively few points capable of effective defense. The one most favorable to the Confederate needs was at Columbus, in the State of Kentucky, eighteen miles below Cairo, on a high bluff commanding the river for about five miles. Both the Union and Confederate commanders coveted this situation, for its natural advantages were such that when fully fortified it became familiarly known as the "Gibraltar of the West." So far, through the neutrality policy of Kentucky, it had remained unappropriated by either side. On the first day of September, the rebel General Polk, commanding at Memphis, sent a messenger to Governor Magoffin to obtain confidential information about the "future plans and policy of the Southern party in Kentucky," explaining his desire to "be ahead of the enemy in occupying Columbus and Paducah." Buckner at the same time was in Richmond, proposing to the Confederate authorities certain military movements in Kentucky, "in advance of the action of her governor." On September 3 they promised him, as definitely as they could, countenance and assistance in his scheme; and a week after, he accepted a brigadier-general's commission from Jefferson Davis. While Buckner was negotiating, General Polk initiated the rebel invasion of Kentucky. Whether upon information from Governor Magoffin or elsewhere, he ordered Pillow with his detachment of six thousand men to move up the river from New Madrid and occupy the town of Columbus.

The Confederate movement created a general flurry in neutrality circles. Numerous protests went to both Polk and the Richmond authorities, and Governor Harris hastened to assure Governor Magoffin that he was in entire ignorance of it, and had appealed to Jefferson Davis to order the troops withdrawn. Even the rebel Secretary of War was mystified by the report, and directed Polk to order the troops withdrawn from Kentucky. Jefferson Davis however, either with prior knowledge or with truer instinct, telegraphed to Polk: "The necessity justifies the action."* In his letter to Davis, the general strongly argued the propriety of his course: "I believe, if we could have found a respectable pretext, it would have been better to have seized this place some months ago, as I am convinced we had more friends then in Kentucky than we have had since, and every hour's delay made against us. Kentucky was fast

melting away under the influence of the Lincoln Government." He had little need to urge this view. Jefferson Davis had already written him, "We cannot permit the indeterminate quantities, the political elements, to control our action in cases of military necessity";† and to Governor Harris, "Security to Tennessee and other parts of the Confederacy is the primary object. To this all else must give way."‡

To strengthen further and consolidate the important military enterprises thus begun, Jefferson Davis now adopted a recommendation of Polk that

They should be combined from west to east across the Mississippi Valley, and placed under the direction of one head, and that head should have large discretionary powers. Such a position is one of very great responsibility, involving and requiring large experience and extensive military knowledge, and I know of no one so well equal to that task as our friend General Albert S. Johnston.

Johnston, with the rank of general, was duly assigned, on September 10, to the command of Department No. 2, covering in general the States of Tennessee, Arkansas, part of Mississippi, Kentucky, Missouri, Kansas, and the Indian Territory. Proceeding at once to Nashville and conferring with the local authorities, he wrote back to Richmond, under date of September 16:

So far from yielding to the demand for the withdrawal of our troops, I have determined to occupy Bowling Green at once. . . . I design to-morrow (which is the earliest practicable moment) to take possession of Bowling Green with five thousand troops, and prepare to support the movement with such force as circumstances may indicate and the means at my command may allow.

The movement was promptly carried out. Buckner was put in command of the expedition; and seizing several railroad trains, he moved forward to Bowling Green on the morning of the 18th, having sent ahead five hundred men to occupy Munfordville, and issuing the usual proclamation, that his invasion was a measure of defense. Meanwhile the third column of invaders entered eastern Kentucky through Cumberland Gap. Brigadier-General Zollicoffer had eight or ten thousand men under his command in eastern Tennessee, but, as elsewhere, much scattered, and badly armed and supplied. Under his active supervision, during the month of August he somewhat improved the organization of his forces and acquainted himself with the intricate topography of the mountain region he was in. Prompted probably from Kentucky, he was ready early in September to join in the combined movement into that State. About the 10th he advanced with six regiments through

* Davis to Polk, Sept. 4, 1861. War Records.

† Davis to Polk, Sept. 15, 1861. Ibid.

‡ Davis to Harris, Sept. 13, 1861. Ibid.

Cumberland Gap to Cumberland Ford, and began planning further aggressive movements against the small Union force, principally Home Guards, which had been collected and organized at Camp Dick Robinson.

The strong Union legislature which Kentucky elected in August met in Frankfort, the capital, on the 2d of September. Polk, having securely established himself at Columbus, notified the governor of his presence, and offered as his only excuse the alleged intention of the Federal troops to occupy it. The legislature, not deeming the excuse sufficient, passed a joint resolution instructing the governor "to inform those concerned that Kentucky expects the Confederate or Tennessee troops to be withdrawn from her soil unconditionally."* The governor vetoed the resolution, on the ground that it did not also embrace the Union troops; the legislature passed it over his veto. Governor Magoffin now issued his proclamation, as directed. Polk and Jefferson Davis replied that the Confederate army would withdraw if the Union army would do the same. To this the legislature responded with another joint resolution, that the conditions prescribed were an insult to the dignity of the State, "to which Kentucky cannot listen without dishonor," and "that the invaders must be expelled." The resolution further required General Robert Anderson to take instant command, with authority to call out a volunteer force, in all of which the governor was required to lend his aid. Kentucky was thus officially taken out of her false attitude of neutrality, and placed in active coöperation with the Federal Government to maintain the Union. Every day increased the strength and zeal of her assistance. A little later in the session a law was enacted declaring enlistments under the Confederate flag a misdemeanor and the invasion of Kentucky by Confederate soldiers a felony, and prescribing heavy penalties for both. Finally, the legislature authorized the enlistment of forty thousand volunteers to "repel invasion," providing also that they should be mustered into the service of the United States and coöperate with the armies of the Union. This was a complete revolution from the anti-coercion resolutions that the previous legislature had passed in January.

Hitherto there were no Federal forces in Kentucky except the brigade which Lieutenant Nelson had organized at Camp Dick Robinson; the Home Guards in various counties, though supplied with arms by the Federal Government, were acting under State militia laws. General Robert Anderson, commanding the military department which embraced Kentucky, still kept his headquarters

at Cincinnati, and Rousseau, a prominent Kentuckian, engaged in organizing a brigade of Kentuckians, had purposely made his camp on the Indiana side of the Ohio River. Nevertheless President Lincoln, the governors of Ohio and Indiana, and the various military commanders had for months been ready to go to the assistance of the Kentucky Unionists whenever the emergency should arise. Even if the neutral attitude of Kentucky had not been brought to an end by the advance of the Confederate forces, it would have been by that of the Federals. A point had been reached where further inaction was impossible. Three days before General Pillow occupied Hickman, Frémont sent General Grant to south-eastern Missouri, to concentrate the several Federal detachments, drive out the enemy, and destroy a rumored rebel battery at Belmont. His order says finally, "It is intended, in connection with all these movements, to occupy Columbus, Kentucky, as soon as possible." It was in executing a part of this order that the gun-boats sent to Belmont extended their reconnaissance down the river, and discovered the advance of the Confederates on the Kentucky shore. An unexpected delay in the movement of one of Grant's detachments occurred at the same time; and that commander, with the military intuition which afterward rendered him famous, postponed the continuance of the local operations in Missouri, and instead immediately prepared an expedition into Kentucky, which became the initial step of his brilliant and fruitful campaign in that direction a few months later. He saw that Columbus, his primary objective point, was lost for the present; but he also perceived that another, of perhaps equal strategical value, yet lay within his grasp, though clearly there was no time to be wasted in seizing it. The gun-boat reconnaissance on the Mississippi River, which revealed the rebel occupation of Kentucky, was begun on September 4. On the following day General Grant, having telegraphed the information to Frémont and to the Kentucky legislature, hurriedly organized an expedition of 2 gun-boats, 1800 men, 16 cannon for batteries, and a supply of provisions and ammunition on transports. Taking personal command, he started with the expedition from Cairo at midnight of the 5th, and proceeded up the Ohio River to the town of Paducah, at the mouth of the Tennessee, where he arrived on the morning of the 6th. A contraband trade with the rebels, by means of small steamboats plying on the Tennessee and Cumberland rivers, had called special attention to the easy communication between this point and central Tennessee. Helanded without opposition and took possession, making

* War Records.

arrangements to fortify and permanently hold the place; having done which, he himself returned to Cairo the same afternoon, to report his advance and forward reinforcements. The importance of the seizure was appreciated by the rebels, for, on the 13th of September, Buckner wrote to Richmond, "Our possession of Columbus is already neutralized by that of Paducah."

The culmination of affairs in Kentucky had been carefully watched by the authorities in Washington. From a conference with President Lincoln, Anderson returned to Cincinnati on September 1, taking with him two subordinates of exceptional ability, Brigadier-Generals Sherman and Thomas. A delegation of prominent Kentuckians met him, to set forth the critical condition of their State. He dispatched Sherman to solicit help from Frémont and the governors of Indiana and Illinois, and a week later moved his headquarters to Louisville, also sending Thomas to Camp Dick Robinson, to take direction of affairs in that quarter. By the time that Sherman returned from his mission the crisis had already developed itself. The appearance of Polk's forces at Columbus, the action of the legislature, the occupation of Paducah by Grant, and the threatening rumors from Buckner's camp, created a high degree of excitement and apprehension. On September 16 Anderson reported Zollicoffer's invasion through Cumberland Gap, upon which the President telegraphed him to assume active command in Kentucky at once. Added to this, there came to Louisville on the 18th the positive news of Buckner's advance to Bowling Green. This information set all central Kentucky in a military ferment; for the widely published announcement that the State Guards, Buckner's secession militia, would meet at Lexington on September 20, to have a camp drill under supervision of Breckinridge, Humphrey Marshall, and other leaders, seemed too plainly coincident with the triple invasion to be designed for a mere holiday. A rising at Lexington and a junction with Zollicoffer might end in a march upon Frankfort, the capital, to disperse the legislature; a simultaneous advance by Buckner in force and capture of Louisville would, in a brief campaign, complete the subjugation of Kentucky to the rebellion. There remains no record to show whether or not such a plan was among the movements, "in advance of the governor's action," which Buckner discussed with Jefferson Davis on September 3 at Richmond. The bare possibility roused the Unionists of Kentucky to vigorous action. With an evident distrust of Governor Magoffin, a caucus of the Union members of the legislature as-

sumed quasi-executive authority, and through the speakers of the two Houses requested General Thomas, at Camp Dick Robinson, to send a regiment, "fully prepared for fight," to Lexington in advance of the advertised "camp drill" of the State Guards; also promising that the Home Guards should rally in force to support him. Thomas ordered the movement, and, in spite of numerous obstacles, Colonel Bramlette brought his regiment to the Lexington fair ground on the night of the 19th of September. His advent was so sudden that he came near making important arrests. Breckinridge, Humphrey Marshall, Morgan, and other leaders were present, but, being warned, fled in different directions, and the "camp drill," shorn of its guiding spirits, proved powerless for the mischievous ends which had evidently been intended.

At Louisville, General Anderson lost no time in the effort to meet Buckner's advance. There were no organized troops in the city, but the brigade Rousseau had been collecting on the Indiana shore was hastily called across the river and joined to the Louisville Home Guards, making in all some 2500 men, who were sent out by the railroad towards Nashville, under the personal command of Sherman. An expedition of the enemy had already burned the important railroad bridges, apparently, however, with the simple object of creating delay. Nevertheless, Sherman went on and occupied Muldraugh's Hill, where he was soon reinforced; for the utmost efforts had been used by the governors of Ohio and Indiana to send to the help of Kentucky every available regiment. If Buckner meditated the capture of Louisville, this show of force caused him to pause; but he remained firm at Bowling Green, also increasing his army, and ready to take part in whatever movement events might render feasible.

No serious or decisive conflicts immediately followed these various moves on the military chess-board. For the present they served merely to define the hostile frontier. With Polk at Columbus, Buckner at Bowling Green, and Zollicoffer in front of Cumberland Gap, the Confederate frontier was practically along the northern Tennessee line. The Union line ran irregularly through the center of Kentucky. One direct result was rapidly to eliminate the armed secessionists. Humphrey Marshall, Breckinridge, and others who had set up rebel camps hastened with their followers within the protection of the Confederate line. Before further operations occurred, a change of Union commanders took place. The excitement, labors, and responsibilities proved too great for the physical strength of General Anderson. Relieved at his own re-

quest, on October 8, he relinquished the command to General Sherman, who was designated by General Scott to succeed him. The new and heavy duties which fell upon him were by no means to Sherman's liking. "I am forced into the command of this Department against my will," he wrote. Looking at his field with a purely professional eye, the disproportion between the magnitude of his task and the immediate means for its accomplishment oppressed him like a nightmare. There were no troops in Kentucky when he came. The recruits sent from other States were gradually growing into an army, but as yet without drill, equipments, or organization. Kentucky herself was in a curious transition. By vote of her people and her legislature, she had decided to adhere to the Union; but as a practical incident of war, many of her energetic and adventurous young men drifted to Southern camps, while the Union property-holders and heads of families were unfit or unwilling immediately to enlist in active service to sustain the cause they had espoused. The Home Guards, called into service for ten days, generally refused to extend their term. The arms furnished them became easily scattered, and, even if not seized or stolen by young secession recruits and carried to the enemy, were with difficulty recovered for use. Now that the General Government had assumed command and the State had ordered an army, many neighborhoods felt privileged to call for protection rather than furnish a quota for offense. Even where they were ready to serve, the enlistment of the State volunteers, recently authorized by the legislature, had yet scarcely begun.

About the middle of October, Mr. Cameron, Secretary of War, returning from a visit to Frémont, passed through Louisville and held a military consultation with Sherman. General Sherman writes:

I remember taking a large map of the United States, and assuming the people of the whole South to be in rebellion, that our task was to subdue them, showed that McClellan was on the left, having a frontage of less than 100 miles, and Frémont the right, about the same; whereas I, the center, had from the Big Sandy to Paducah, over 300 miles of frontier; that McClellan had 100,000 men, Frémont 60,000, whereas to me had only been allotted about 18,000. I argued that for the purpose of defense we should have 60,000 men at once, and for offense would need 200,000 before we were done. Mr. Cameron, who still lay on the bed, threw up his hands and exclaimed, "Great God! where are they to come from?" I asserted that there were plenty of men at the North, ready and willing to come if he would only accept their services; for it was notorious that regiments had been formed in all the North-western States whose services had been refused by the War Department, on the ground that they would not be needed. We discussed all these matters fully,

in the most friendly spirit, and I thought I had aroused Mr. Cameron to a realization of the great war that was before us, and was in fact upon us.*

While recognizing many of the needs which Sherman pointed out, the Secretary could not immediately promise him any great augmentation of his force.

Complaints and requests of this character were constantly coming to the Administration from all the commanders and governors, and a letter of President Lincoln, written in reply to a similar strain of fault-finding from Indiana, plainly indicates why such requirements in all quarters could not be immediately supplied:

WASHINGTON, D. C., Sept. 29, 1861.

HIS EXCELLENCY GOV. O. P. MORTON: Your letter by the hand of Mr. Prunk was received yesterday. I write this letter because I wish you to believe of us (as we certainly believe of you) that we are doing the very best we can. You do not receive arms from us as fast as you need them; but it is because we have not near enough to meet all the pressing demands, and we are obliged to share around what we have, sending the larger share to the points which appear to need them most. We have great hope that our own supply will be ample before long, so that you and all others can have as many as you need. I see an article in an Indianapolis newspaper denouncing me for not answering your letter sent by special messenger two or three weeks ago. I did make what I thought the best answer I could to that letter. As I remember, it asked for ten heavy guns to be distributed with some troops at Lawrenceburgh, Madison, New Albany, and Evansville; and I ordered the guns and directed you to send the troops if you had them. As to Kentucky, you do not estimate that State as more important than I do; but I am compelled to watch all points. While I write this I am if not in *range* at least in *hearing* of cannon shot, from an army of enemies more than a hundred thousand strong. I do not expect them to capture this city; but I know they would if I were to send the men and arms from here to defend Louisville, of which there is not a single hostile armed soldier within forty miles, nor any force known to be moving upon it from any distance. It is true the army in our front may make a half-circle around southward and move on Louisville; but when they do, we will make a half-circle around northward and meet them; and in the mean time we will get up what forces we can from other sources to also meet them.

I hope Zollicoffer has left Cumberland Gap (though I fear he has not), because, if he has, I rather infer he did it because of his dread of Camp Dick Robinson, reinforced from Cincinnati, moving on him, than because of his intention to move on Louisville. But if he does go round and reinforce Buckner, let Dick Robinson come round and reinforce Sherman, and the thing is substantially as it was when Zollicoffer left Cumberland Gap. I state this as an illustration; for in fact I think if the Gap is left open to us Dick Robinson should take it and hold it; while Indiana, and the vicinity of Louisville in Kentucky, can reinforce Sherman faster than Zollicoffer can Buckner. . . .

Yours, very truly, A. LINCOLN.†

The conjectures of the President proved substantially correct. Great as was the need of arms for Union regiments, the scarcity among the rebels was much greater. Of the 30,000

* Sherman, "Memoirs," Vol. I., p. 203.

† Unpublished MS.

stands which Johnston asked for when he assumed command, the rebel War Department could only send him 1000. Ammunition and supplies were equally wanting. He called out 50,000 volunteers from Tennessee, Mississippi, and Arkansas, but reinforcements from this and other sources were slow. His greatest immediate help came by transferring Hardee with his division from Missouri to Bowling Green. If, as Sherman surmised, a concentration of his detachments would have enabled him to make a successful march on Louisville, he was unwilling to take the risk. The contingency upon which the rebel invasion was probably based, the expected rising in Kentucky, had completely failed. Johnston wrote to Richmond:

We have received but little accession to our ranks since the Confederate forces crossed the line; in fact, no such enthusiastic demonstration as to justify any movements not warranted by our ability to maintain our own communications.*

One of his recruiting brigadiers wrote:

The Kentuckians still come in small squads; I have induced the most of them to go in for the war. This requires about three speeches a day. When thus stirred up they go, almost to a man. Since I have found that I can't be a general, I have turned recruiting agent and sensation speaker for the brief period that I shall remain.†

For the present Johnston's policy was purely defensive; he directed Cumberland Gap to be fortified, and completed the works at Columbus, "to meet the probable flotilla from the North, supposed to carry two hundred heavy guns," while Buckner was vigorously admonished to "Hold on to Bowling Green." He made this order when Buckner had six thousand men; but even when that number was doubled, after the arrival of Hardee, Johnston was occupied with calculations for defense and asking for further reinforcements.‡

LINCOLN DIRECTS COÖPERATION.

At the beginning of December, 1861, the President was forced to turn his serious personal attention to army matters. Except to organize, drill, and review the Army of the Potomac, to make an unfruitful reconnaissance and to suffer the lamentable Ball's Bluff disaster, McClellan had nothing to show for his six months of local and two months of chief command. The splendid autumn weather, the wholesome air and dry roads, had come and gone. Rain, snow, and mud, crippling clogs to military movements in all lands and

epochs, were to be expected for a quarter if not for half of the coming year. Worse than all, McClellan had fallen seriously ill. With most urgent need of early action, every prospect of securing it seemed to be thus cut off. In this dilemma Lincoln turned to the Western commanders. "General McClellan is sick," he telegraphed to Halleck on the last day of the year. "Are General Buell and yourself in concert?" The following day, being New Year's, he repeated his inquiry, or rather his prompting suggestion, that, McClellan being incapable of work, Buell and Halleck should at once establish a vigorous and hearty co-operation. Their replies were not specially promising. "There is no arrangement between General Halleck and myself," responded Buell, adding that he depended on McClellan for instructions to this end; while Halleck said, "I have never received a word from General Buell. I am not ready to coöperate with him"; adding, in his turn, that he had written to McClellan, and that too much haste would ruin everything. Plainly, therefore, the military machine, both East and West, was not only at a complete standstill, but was without a programme.

Of what avail, then, were McClellan's office and function of General-in-Chief, if such a contingency revealed either his incapacity or his neglect? The force of this question is immensely increased when we see how in the same episode McClellan's acts followed Lincoln's suggestions. However silent and confiding in the skill and energy of his generals, the President had studied the military situation with unremitting diligence. In his telegram of December 31 to Halleck, he started a pregnant inquiry. "When he [Buell] moves on Bowling Green, what hinders it being reinforced from Columbus?" And he asked the same question at the same time of Buell. Halleck seems to have had no answer to make; Buell sent the only reply that was possible: "There is nothing to prevent Bowling Green being reinforced from Columbus if a military force is not brought to bear on the latter place."

Lincoln was not content to permit this know-nothing and do-nothing policy to continue. "I have just been with General McClellan, and he is much better," he wrote the day after New Year's; and in this interview the necessity for action and the telegrams from the Western commanders were fully discussed, as becomes evident from the fact that the following day McClellan wrote a letter to Halleck containing an earnest suggestion to remedy the neglect and need pointed out by Lincoln's dispatch of December 31. In this letter McClellan advised an expedition up the Cumberland River, a dem-

* War Records.

† Alcorn to Buckner, Oct. 21, 1861. Ibid.

‡ Johnston to Cooper, Oct. 17, 1861. Ibid.

onstration on Columbus, and a feint on the Tennessee River, all for the purpose of preventing reinforcements from joining Buckner and Johnston at Bowling Green, whom Buell was preparing to attack.

Meanwhile Lincoln's dispatch of inquiry had renewed the attention, and perhaps aroused the ambition, of Buell. He and Halleck had, after Lincoln's prompting, interchanged dispatches about concerted action. Halleck reported a withdrawal of troops from Missouri "almost impossible"; to which Buell replied that "the great power of the rebellion in the West is arrayed" on a line from Columbus to Bowling Green, and that two gun-boat expeditions with a support of 20,000 men should attack its center by way of the Cumberland and Tennessee rivers, and that "whatever is done should be done speedily, within a few days." Halleck, however, did not favorably entertain the proposition. His reply discussed an altogether different question. He said it would be madness for him with his forces to attempt any serious operation against Camp Beauregard or Columbus; and that if Buell's Bowling Green movement required his help it ought to be delayed a few weeks, when he could probably furnish some troops. Leaving altogether unanswered Buell's suggestion for the movement up the Cumberland and the Tennessee, Halleck stated his strong disapproval of the Bowling Green movement, and on the same day he repeated these views a little more fully in a letter to the President. Premising that he could not at the present time withdraw any troops from Missouri, "without risking the loss of this State," he said:

I know nothing of General Buell's intended operations, never having received any information in regard to the general plan of campaign. If it be intended that his column shall move on Bowling Green while another moves from Cairo or Paducah on Columbus or Camp Beauregard, it will be a repetition of the same strategic error which produced the disaster of Bull Run. To operate on exterior lines against an enemy occupying a central position will fail, as it always has failed, in ninety-nine cases out of a hundred. It is condemned by every military authority I have ever read. General Buell's army and the forces at Paducah occupy precisely the same position in relation to each other and to the enemy as did the armies of McDowell and Patterson before the battle of Bull Run.

Lincoln, finding in these replies but a continuation of not only the system of delay, but also the want of plans, and especially of energetic joint action, which had thus far in a majority of cases marked the operations of the various commanders, was not disposed further to allow matters to remain in such unfruitful conditions. Under his prompting McClellan, on this same 6th of January, wrote to

Buell, "Halleck, from his own account, will not soon be in a condition to support properly a movement up the Cumberland. Why not make the movement independently of and without waiting for that?" And on the next day Lincoln followed this inquiry with a still more energetic monition: "Please name as early a day as you safely can, on or before which you can be ready to move southward in concert with Major-General Halleck. Delay is ruining us, and it is indispensable for me to have something definite. I send a like dispatch to Major-General Halleck." This somewhat peremptory order seems to have brought nothing except a reply from Halleck: "I have asked General Buell to designate a day for a demonstration to assist him. It is all I can do till I get arms." Three days later, Halleck's already quoted letter of the 6th reached Washington by mail, and after its perusal the President indorsed upon it, with a heart-sickness easily discernible in the words, "The within is a copy of a letter just received from General Halleck. It is exceedingly discouraging. As everywhere else, nothing can be done."

Nevertheless, something was being done: very little at the moment, it is true, but enough to form the beginning of momentous results. On the same day on which Halleck had written the discouraging letter commented upon above by the President, he had also transmitted to Grant at Cairo the direction, "I wish you to make a demonstration in force on Mayfield and in the direction of Murray." The object was, as he further explained, to prevent reinforcements being sent to Buckner at Bowling Green. He was to threaten Camp Beauregard and Murray, to create the impression that not only was Dover (Fort Donelson) to be attacked, but that a great army to be gathered in the West was to sweep down towards Nashville, his own column being merely an advance guard. Commodore Foote was to assist by a gun-boat demonstration. "Be very careful, however," added Halleck, "to avoid a battle; we are not ready for that; but cut off detached parties and give your men a little experience in skirmishing."

If Halleck's order for a demonstration against Mayfield and Murray, creating an indirect menace to Columbus and Dover, had gone to an unwilling or negligent officer, he could have found in his surrounding conditions abundant excuses for evasion or non-compliance. There existed at Cairo, as at every other army post, large or small, lack of officers, of organization, of arms, of equipments, of transportation, of that multitude of things considered necessary to the efficiency of moving troops. But in the West the sudden increase of armies brought to command,

and to direction and management, a large proportion of civilians, lacking methodical instruction and experience, which was without question a serious defect, but which left them free to invent and to adopt whatever expedients circumstances might suggest, or which rendered them satisfied, and willing to enter upon undertakings amidst a want of preparation and means that better information might have deemed indispensable.

The detailed reports and orders of the expedition we are describing clearly indicate these latter characteristics. We learn from them that the weather was bad, the roads heavy, the quartermaster's department and transportation deficient, and the gun-boats without adequate crews. Yet nowhere does it appear that these things were treated as impediments. Halleck's instructions dated January 6 were received by Grant on the morning of the 8th, and his answer was that immediate preparations were being made for carrying them out, and that Commodore Foote would coöperate with three gun-boats. "The continuous rains for the last week or more," says Grant, "have rendered the roads extremely bad, and will necessarily make our movement slow. This however will operate worse upon the enemy, if he should come out to meet us, than upon us." The movement began on the evening of January 9, and its main delay occurred through Halleck's orders. It was fully resumed on the 12th. Brigadier-General McClelland, with five thousand men, marched southward, generally parallel to the Mississippi River, to Mayfield, midway between Fort Henry and Columbus, and pushed a reconnaissance closely up to the latter place. Brigadier-General Smith, starting from Paducah, marched a strong column southward, generally parallel to the Tennessee River, to Calloway, near Fort Henry. Foote and Grant, with three gun-boats, two of them new iron-clads, ascended the Tennessee to Fort Henry, drew the fire of the fort, and threw several shells into the works. It is needless to describe the routes, the precautions, the marching and counter-marching to mystify the enemy. While the rebels were yet expecting a further advance, the several detachments were already well on their return. "The expedition," says Grant, "if it had no other effect, served as a fine reconnaissance." But it had more positive results. Fort Henry and Columbus were thoroughly alarmed and drew in their outposts, while the Union forces learned from inspection that the route offered a feasible line of march to attack and invest Columbus, and demonstrated the inherent weakness and vulnerability of Fort Henry. This, be it remembered, was done with raw forces and

without preparation, but with officers and men responding alike promptly to every order and executing their task more than cheerfully, even eagerly, with such means as were at hand when the order came. "The reconnaissance thus made," reports McClelland, "completed a march of 140 miles by the cavalry, and 75 miles by the infantry, over icy or miry roads, during a most inclement season." He further reports that the circumstances of the case "prevented me from taking, on leaving Cairo, the five-days' supply of rations and forage directed by the commanding officer of this district; hence the necessity of an early resort to other sources of supply. None other presented but to quarter upon the enemy or to purchase from loyal citizens. I accordingly resorted to both expedients as I had opportunity."

Lincoln's prompting did not end with merely having produced this reconnaissance. The President's patience was well-nigh exhausted; and while his uneasiness drove him to no act of rashness, it caused him to repeat his admonitions and suggestions. In addition to his telegrams and letters to the Western commanders between December 31 and January 6, he once more wrote to both, on January 13, to point out how advantage might be taken of the military condition as it then existed. Halleck had emphasized the danger of moving on "exterior lines," and insisted that it was merely repeating the error committed at Bull Run and would as inevitably produce disaster. Lincoln in his letter shows that the defeat at Bull Run did not result from movement on exterior lines, but from failure to use exterior lines with judgment and concert; and he further illustrated how the Western armies might now, by judicious coöperation, secure important military results.

MY DEAR SIR: * Your dispatch of yesterday is received, in which you say, "I have received your letter and General McClelland's, and will at once devote all my efforts to your views and his." In the midst of my many cares I have not seen nor asked to see General McClelland's letter to you. For my own views, I have not offered, and do not now offer, them as orders; and while I am glad to have them respectfully considered, I would blame you to follow them contrary to your own clear judgment, unless I should put them in the form of orders. As to General McClelland's views, you understand your duty in regard to them better than I do. With this preliminary, I state my general idea of this war to be, that we have the greater numbers, and the enemy has the greater facility of concentrating forces upon points of collision; that we must fail unless we can find some way of making our advantage an overmatch for his; and that this can only be done by menacing him with superior forces at different points at the same time, so that we can safely attack one or both if he makes no

* This letter was addressed to Buell, but a copy of it was also sent to Halleck. [War Records.]

change; and if he weakens one to strengthen the other, forbear to attack the strengthened one, but seize and hold the weakened one, gaining so much. To illustrate: Suppose last summer, when Winchester ran away to reinforce Manassas, we had forborne to attack Manassas, but had seized and held Winchester. I mention this to illustrate, not to criticize. I did not lose confidence in McDowell, and I think less harshly of Patterson than some others seem to. In application of the general rule I am suggesting, every particular case will have its modifying circumstances, among which the most constantly present and most difficult to meet will be the want of perfect knowledge of the enemy's movements. This had its part in the Bull Run case; but worse in that case was the expiration of the terms of the three-months' men. Applying the principle to your case, my idea is that Halleck shall menace Columbus and "down river" generally, while you menace Bowling Green and east Tennessee. If the enemy shall concentrate at Bowling Green do not retire from his front, yet do not fight him there either; but seize Columbus and east Tennessee, one or both, left exposed by the concentration at Bowling Green. It is a matter of no small anxiety to me, and one which I am sure you will not overlook, that the east Tennessee line is so long and over so bad a road.

Buell made no reply to this letter of Lincoln's; but Halleck sent an indirect answer a week later, in a long letter to General McClellan, under date of January 20. The communication is by no means a model of correspondence when we remember that it emanates from a trained writer upon military science. It is long and somewhat rambling; it finds fault with politics and politicians in war, in evident ignorance of both politics and politicians. It charges that past want of success "is attributable to the politicians rather than to the generals," in plain contradiction of the actual facts. It condemns "pepper-box strategy," and recommends detached operations in the same breath. The more noticeable point of the letter is that, while reiterating that the General-in-Chief had furnished no general plan, and while the principal commanders had neither unity of views nor concert of action, it ventures, though somewhat feebly, to recommend a combined system of operations for the West. Says Halleck, in this letter:

The idea of moving down the Mississippi by steam is, in my opinion, impracticable, or at least premature. It is not a proper line of operations, at least now. A much more feasible plan is to move up the Cumberland and Tennessee, making Nashville the first objective point. This would turn Columbus and force the abandonment of Bowling Green. . . . This line of the Cumberland or Tennessee is the great central line of the western theater of war, with the Ohio below the mouth of Green River as the base, and two good navigable rivers extending far into the interior of the theater of operations. But the plan should not be attempted without a large force—not less than 60,000 effective men.

The idea was by no means new. Buell had tentatively suggested it to McClellan as early as November 27; McClellan had asked further details about it December 5; Buell had

again specifically elaborated it, "as the most important strategical point in the whole field of operations," to McClellan on December 29, and as the "center" of the rebellion front in the West, to Halleck on January 3. Yet, recognizing this line as the enemy's chief weakness, McClellan at Washington, Buell at Louisville, and Halleck at St. Louis, holding the President's unlimited trust and authority, had allowed nearly two months to elapse, directing the Government power to other objects, to the neglect, not alone of military success, but of plans of coöperation, of counsel, of intention to use this great and recognized military advantage, until the country was fast losing confidence and even hope. Even now Halleck did not propose immediately to put his theory into practice. Like Buell, he was calling for more troops for the "politicians" to supply. It is impossible to guess when he might have been ready to move on his great strategic line, if subordinate officers, more watchful and enterprising, had not in a measure forced the necessity upon his attention.

GRANT AND THOMAS IN KENTUCKY.

IN the early stage of military organization in the West, when so many volunteer colonels were called to immediate active duty in the field, the West Point education of Grant and his practical campaign training in the Mexican war made themselves immediately felt and appreciated at the department headquarters. His usefulness and superiority were at once evident by the clearness and brevity of his correspondence, the correctness of routine reports and promptness of their transmission, the pertinence and practical quality of his suggestions, the readiness and fertility of expedient with which he executed orders. Any one reading over his letters of this first period of his military service is struck by the fact that through him something was always accomplished. There was absence of excuse, complaint, or delay; always the report of a task performed. If his means or supplies were imperfect, he found or improvised the best available substitute; if he could not execute the full requirement, he performed so much of it as was possible. He always had an opinion, and that opinion was positive, intelligible, practical. We find therefore that his allotted tasks from the very first rose continually in importance. He gained in authority and usefulness, not by solicitation or intrigue, but by services rendered. He was sent to more and more difficult duties, to larger supervision, to heavier responsibilities. From guarding a station at Mexico on the North

Missouri railroad, to protecting a railroad terminus at Ironton in south-east Missouri; from there to brief inspection duty at Jefferson City, then to the command of the military district of south-east Missouri; finally to the command of the great military depot and rendezvous at Cairo, Illinois, with its several outlying posts and districts, and the supervision of its complicated details about troops, arms, and supplies to be collected and forwarded in all directions,—clearly it was not chance which brought him to such duties, but his fitness to perform them. It was from the vantage ground of this enlarged command that he had checkmated the rebel occupation of Columbus, by immediately seizing Paducah and Smithland. And from Cairo also he organized and led his first experiment in field fighting, at what is known as the battle of Belmont.

Just before Frémont was relieved, and while he was in the field in nominal pursuit of Price, he had ordered Grant to clear south-eastern Missouri of guerrillas, with the double view of restoring local authority and preventing reinforcements to Price. Movements were in progress to this end when it became apparent that the rebel stronghold at Columbus was preparing to send out a column.

Grant organized an expedition to counteract this design, and on the evening of November 6 left Cairo with about 3000 men on transports, under convoy of 2 gun-boats, and steamed down the river. Upon information gained while on his route, he determined to break up a rebel camp at Belmont Landing, on the Missouri shore opposite Columbus, as the best means of making his expedition effective. On the morning of the 7th he had landed his troops at Hunter's Point, three miles above Belmont, and marched to a favorable place for attack back of the rebel encampment, which was situated in a large open field and was protected on the land side by a line of abatis. By the time Grant reached his position the rebel camp, originally consisting of a single regiment, had been reinforced by four regiments under General Pillow, from Columbus. A deliberate battle, with about equal forces, ensued. Though the Confederate line courageously contested the ground, the Union line, steadily advancing, swept the rebels back, penetrating the abatis and gaining the camp of the enemy, who took shelter in disorder under the steep river-bank. Grant's troops had gained a complete and substantial victory, but they now frittered it away by a disorderly exultation, and a greedy plunder of the camp they had stormed. The record does not show who was responsible for the unmilitary conduct, but it quickly brought its

retribution. Before the Unionists were aware of it, General Polk had brought an additional reinforcement of several regiments across the river and hurriedly marched them to cut off the Federal retreat, which, instead of an orderly march from the battle-field, became a hasty scramble to get out of danger. Grant himself, unaware that the few companies left as a guard near the landing had already embarked, remained on shore to find them, and encountered instead the advancing rebel line. Discovering his mistake, he rode back to the landing, where "his horse slid down the river-bank on its haunches and trotted on board a transport over a plank thrust out for him."* Belmont was a drawn battle; or, rather, it was first a victory for the Federals and then a victory for the Confederates. The courage and the loss were nearly equal: 79 killed and 289 wounded on the Union side; 105 killed and 419 wounded on the Confederate side.

Brigadier-General McClelland, second in command in the battle of Belmont, was a fellow-townsmen of the President, and to him Lincoln wrote the following letter of thanks and encouragement to the troops engaged:

This is not an official but a social letter. You have had a battle, and without being able to judge as to the precise measure of its value, I think it is safe to say that you, and all with you, have done honor to yourselves and the flag, and service to the country. Most gratefully do I thank you and them. In my present position, I must care for the whole nation; but I hope it will be no injustice to any other State for me to indulge a little home pride, that Illinois does not disappoint us. I have just closed a long interview with Mr. Washburne, in which he has detailed the many difficulties you and those with you labor under. Be assured, we do not forget or neglect you. Much, very much, goes undone; but it is because we have not the power to do it faster than we do. Some of your forces are without arms; but the same is true here, and at every other place where we have considerable bodies of troops. The plain matter-of-fact is, our good people have rushed to the rescue of the Government faster than the Government can find arms to put into their hands. It would be agreeable to each division of the army to know its own precise destination; but the Government cannot immediately, nor inflexibly at any time, determine as to all; nor, if determined, can it tell its friends without at the same time telling its enemies. We know you do all as wisely and well as you can; and you will not be deceived if you conclude the same is true of us. Please give my respects and thanks to all.†

Belmont having been a mere episode, it drew after it no further movement in that direction. Grant and his command resumed their routine work of neighborhood police and observation. Buell and Halleck, both coming to their departments as new commanders shortly afterward, were absorbed with difficulties at other points. Secession was not yet

* Force, "From Fort Henry to Corinth," p. 23.

† Lincoln to McClelland, Nov. 10, 1861. Unpublished MS.

quieted in Kentucky. The Union troops at Cairo, Paducah, Smithland, and other river towns yet stood on the defensive, fearing rebel attack rather than preparing to attack rebels. Columbus and Bowling Green were the principal Confederate camps, and attracted and received the main attention from the Union commanders.

The first noteworthy occurrence following Belmont, as well as the beginning of the succession of brilliant Union victories which distinguished the early months of the year 1862, was the battle of Mill Springs, in eastern Kentucky. It had been the earnest desire of President Lincoln that a Union column should be sent to seize and hold east Tennessee, and General McClellan had urged such movement upon General Buell in several dispatches almost peremptory in their tone. At first Buell seemed to entertain the idea and promised compliance; but as his army increased in strength and discipline his plans and hopes centered themselves in an advance against Bowling Green, with the design to capture Nashville. General Thomas remained posted in eastern Kentucky, hoping that he might be called upon to form his column and lead it through the Cumberland Gap to Knoxville; but the weeks passed by, and the orders which he received only tended to scatter his few regiments for local defense and observation. With the hesitation of the Union army at this point, the Confederates became bolder. Zollicoffer established himself in a fortified camp on the north bank of the Cumberland River, where he could at the same time defend Cumberland Gap and incite eastern Kentucky to rebellion. Here he became so troublesome that Buell found it necessary to dislodge him, and late in December sent General Thomas orders to that effect. Thomas was weak in numbers, but strong in vigilance and courage. He made a difficult march during the early weeks of January, 1862, and halted at Logan's Cross Roads, within ten miles of the rebel camp, to await the junction of his few regiments. The enemy, under Zollicoffer and his district commander, Crittenden, resolved to advance and crush him before he could bring his force together. Thomas prepared for and accepted battle. The enemy had made a fatiguing night march of nine miles, through a cold rain and over muddy roads. On the morning of January 19 the battle, begun with spirit, soon had a dramatic incident. The rebel commander, Zollicoffer, mistaking a Union regiment, rode forward and told its commanding officer, Colonel Speed S. Fry, that he was firing upon friends. Fry, not aware that Zollicoffer was an enemy, turned away to order his men to stop firing. At this moment one of

Zollicoffer's aides rode up, and seeing the true state of affairs drew his revolver and began firing at Fry, wounding his horse. Fry, wheeling in turn, drew his revolver and returned the fire, shooting Zollicoffer through the heart.* The fall of the rebel commander served to hasten and complete the defeat of the Confederates. They retreated in disorder to their fortified camp at Mill Springs. Thomas ordered immediate pursuit, and the same night invested their camp and made preparations to storm their intrenchments the following morning. When day came, however, it was found that the rebels had precipitately crossed the Cumberland River during the night, abandoning their wounded, twelve pieces of artillery, many small-arms, and extensive supplies, and had fled in utter dispersion to the mountains. It was one of the most remarkable Union victories of the war. General Thomas's forces consisted of a little over six regiments, those of Crittenden and Zollicoffer something over ten regiments.† It was more than a defeat for the Confederates. Their army was annihilated, and Cumberland Gap once more stood exposed, so that Buell might have sent a Union column and taken possession of eastern Tennessee with but feeble opposition. It is possible that the brilliant opportunity would at last have tempted him to comply with the urgent wishes of the President and the express orders of the General-in-Chief, had not unexpected events in another quarter diverted his attention and interest.

There was everywhere, about the months of December, 1861, and January, 1862, a perceptible increase of the Union armies by fresh regiments from the Northern States, a better supply of arms through recent importations, an increase of funds from new loans, and the delivery for use of various war material, the product of the summer's manufacture. Of prime importance to the military operations which centered at Cairo was the completion and equipment of the new gun-boats. A word of retrospect concerning this arm of the military service is here necessary. Commander John Rodgers was sent West in the month of May, 1861, to begin the construction of war vessels for Western rivers. Without definite plans he had purchased, and hastily converted, and armed as best he might, three river steamers. These were put into service in September. They were provided with cannon, but had no iron plating. They were the *Tyler*,‡ of 7 guns; the *Lexington*, of 6 guns; and the *Con-*

* Cist, "Army of the Cumberland," pp. 17, 18.

† Van Horne, "History of the Army of the Cumberland," Vol. I., p. 57.

‡ This vessel seems to have been named the *Tyler* at one time and the *Taylor* at another.

estoga, of 3 guns. Making Cairo their central station, they served admirably in the lighter duties of river police, in guarding transports, and in making hasty trips of reconnaissance. For the great expedition down the Mississippi, projected during the summer and fall of 1861, a more powerful class of vessels was provided.* The distinguished civil engineer James B. Eads designed and was authorized to build 7 new gun-boats, to carry 13 guns each, and to be protected about the bows with iron plating capable of resisting the fire of heavy artillery. They were named the *Cairo*, *Carondelet*, *Cincinnati*, *Louisville*, *Mound City*, *Pittsburg*, and *St. Louis*. Two additional gun-boats of the same type of construction, but of larger size,—the *Benton*, of 16 guns, and the *Essex*, of 5 guns,—were converted from other vessels about the same time. At the time Flag-Officer Foote finally accepted the first seven (January 15, 1862), it had been found impossible to supply them with crews of Eastern seamen. Resort was had to Western steamboatmen, and also to volunteers from infantry recruits. The joint reconnaissance of Grant and Foote to Fort Henry on the Tennessee River, January 14, has been related. A second examination was made by General Smith, who on January 22 reports that he had been within two miles and a half of the fort; that the river had risen fourteen feet since the last visit, giving a better opportunity to reconnoiter; more important, that the high water had drowned out a troublesome advance battery, and that, in his opinion, two iron-clad gun-boats could make short work of it. It is evident that, possessed of this additional information, Grant and Foote immediately resolved upon vigorous measures. Grant had already asked permission to visit Halleck at St. Louis. This was given; but Halleck refused to entertain his project. So firmly convinced was Grant, however, that his plan was good, that, though unsuccessful at first, he quickly renewed the request.† “Commanding-General Grant and myself,” telegraphed Foote to Halleck (January 28, 1862), “are of opinion that Fort Henry on the Tennessee River can be carried with four iron-clad gun-boats and troops to permanently occupy. Have we your authority to move for that purpose when ready?” To this Grant on the same day added the direct proposal, “With permission, I will take Fort Henry on the Ten-

nessee, and establish and hold a large camp there.” It would appear that no immediate answer was returned, for on the following day Grant renews his proposition with more emphasis.‡

It is easy to perceive what produced the sudden change in Halleck’s mind. Grant’s persistent urging was evidently the main influence, but two other events contributed essentially to the result. The first was the important victory gained by Thomas at Mill Springs in eastern Kentucky on January 19, the certain news of which was probably just reaching him; the second was a telegram from Washington, informing him that General Beauregard, with fifteen regiments from the Confederate army in Virginia, was being sent to Kentucky to be added to Johnston’s army.§ “I was not ready to move,” explains Halleck afterward, “but deemed best to anticipate the arrival of Beauregard’s forces.” It is well also to remember in this connection that two days before, President Lincoln’s War Order No. 1 had been published, ordering a general movement of all the armies of the Union on the coming 22d of February. Whatever induced it, the permission now given was full and hearty. “Make your preparations to take and hold Fort Henry,” Halleck telegraphed to Grant on the 30th of January. “I will send you written instructions by mail.”

Grant and Foote had probably already begun their preparation. Receiving Halleck’s instructions on February 1, Grant on the following day started his expedition of 15,000 men on transports, and Foote accompanied him with 7 gun-boats for convoy and attack. Their plan contemplated a bombardment by the fleet from the river, and assault on the land side by the troops. For this purpose General McClelland, with a division, was landed four miles below the fort on February 4. They made a reconnaissance on the 5th, and being joined by another division, under General Smith, were ordered forward to invest the fort on the 6th. This required a circuitous march of eight miles, during which the gun-boats of Flag-Officer Foote, having less than half the distance to go by the river, moved on and began the bombardment. The capture proved easier than was anticipated. General Tilghman, the Confederate commander of the

* To show the unremitting interest of the President in these preparations, and how his encouragement and prompting followed even their minor details, we quote from his autograph manuscript a note to the Secretary of War:

EXECUTIVE MANSION, Jan. 24, 1862.

HON. SECRETARY OF WAR.

MY DEAR SIR: On reflection I think you better make a peremptory order on the ordnance officer at

VOL. XXXVI.—80.

Pittsburg to ship the ten mortars and two beds to Cairo instantly, and all others as fast as finished, till ordered to stop, reporting each shipment to the Department here.

Yours truly,

A. LINCOLN.

† Grant, “Memoirs,” Vol. I., p. 287.

§ McClellan to Halleck and Buell, January 29, 1862. War Records.

fort, had, early that morning, sent away his 3000 infantry to Fort Donelson, being convinced that he was beset by an overpowering force. He kept only one company of artillery to work the eleven river guns of the fort; with these he defended the work about two hours, but without avail. Foote's 4 iron-plated gun-boats steamed boldly within 600 yards. The bombardment, though short, was well sustained on both sides, and not without its fluctuating chances. Two of the heaviest guns in the fort were soon silenced, one by bursting, the other being rendered useless by an accident with the priming wire. At this point a rebel shot passed through the casemate and the boiler of the gun-boat *Essex*, and she drifted helplessly out of the fight. But the remaining gun-boats continued their close and fierce attack, and five more of the rebel guns being speedily disabled, General Tilghman hauled down his flag and came on board to surrender the fort. McClellan's troops, from the land side, soon after entered the work and took formal possession. On the same day Grant telegraphed to Halleck, "Fort Henry is ours"; and his dispatch bore yet another significant announcement eminently characteristic of the man, "I shall take and destroy Fort Donelson on the 8th."

FORT DONELSON.

THE news of the capture of Fort Henry created a sudden consternation among the Confederate commanders in Tennessee. It seemed as if the key-stone had unexpectedly fallen out of their arch of well-planned defenses. Generals Johnston, Beauregard, and Hardee immediately met in a council of war at Bowling Green, and after full discussion united in a memorandum acknowledging the disaster and resolving on the measures which in their judgment it rendered necessary. They foresaw that Fort Donelson would probably also fall; that Johnston's army must retreat to Nashville to avoid capture; that since Columbus was now separated from Bowling Green, the main army at Columbus must retreat to Humboldt, or possibly to Grand Junction, leaving only a sufficient garrison to make a desperate defense of the works and the river;* and immediate orders were issued to prepare for these movements. Nevertheless, Johnston, to use his own language, resolved "to fight for Nashville at Donelson." For this purpose he divided the army at Bowling Green, starting 8000 of his men under Generals Buckner and Floyd, together with 4000 more under

Pillow from other points, on a rapid march to reinforce the threatened fort,† while General Hardee led his remaining 14,000 men on their retreat to Nashville.‡ This retreat was not alone a choice of evils. Even if Fort Henry had not fallen and Donelson been so seriously menaced, the overwhelming force of Buell would have compelled a retrograde movement. Had Buell been a commander of enterprise he would have seized this chance of inflicting great damage upon the diminished enemy in retreat. His advance guard, indeed, followed; but Johnston's remnant, marching night and day, succeeded in reaching the Cumberland River opposite Nashville, where, after preparations to cross in haste, the rebel commander awaited with intense eagerness to hear the fate of Donelson.

Of the two commanders in the West, the idea of the movement up the Tennessee and Cumberland rivers was more favorably thought of by Halleck than by Buell. Buell pointed out its value, but began no movement that looked to its execution. Halleck, on the contrary, not only realized its importance, but immediately entertained the design of ultimately availing himself of it; thus he wrote at the time he ordered the reconnaissance which demonstrated its practicability: "The demonstration which General Grant is now making I have no doubt will keep them [the enemy] in check till preparations can be made for operations on the Tennessee or Cumberland."§ His conception of the necessary preparations was, however, almost equivalent to the rejection of the plan. He thought that it would require a force of 60,000 men; and to delay it till that number and their requisite material of war could be gathered or detached under prevailing ideas would amount to indefinite postponement.

When at last, through Grant's importunity, the movement was actually begun by the advance to capture Fort Henry, a curious interest in the expedition and its capabilities developed itself among the commanders. Grant's original proposition was simply to capture Fort Henry and establish a large camp. Nothing further was proposed, and Halleck's instructions went only to the same extent, with one addition. As the reported arrival of Beauregard with reinforcements had been the turning influence in Halleck's consent, so he proposed that the capture of Fort Henry should be immediately followed by a dash at the railroad bridges across the Tennessee and their destruction, to prevent those reinforcements from reaching Johnston. But

with the progress of Grant's movement the chances of success brightened, and the plan began correspondingly to expand. On the 2d of February, when Grant's troops were preparing to invest Fort Henry, Halleck's estimate of coming possibilities had risen a little. He wrote to Buell:

At present it is only proposed to take and occupy Fort Henry and Dover [Donelson], and, if possible, cut the railroad from Columbus to Bowling Green.

Here we have Donelson added to Henry in the intention of the department commander. That the same intention existed in Grant's mind is evident, for, as already related, on the fall of Henry on the 6th, he immediately telegraphed to Halleck: "Fort Henry is ours. . . . I shall take and destroy Fort Donelson on the 8th and return to Fort Henry." It is to be noted, however, that in proposing to destroy Fort Donelson, he still limits himself to his original proposition of an intrenched camp at Fort Henry.

At the critical moment Halleck's confidence in success at Fort Henry wavered, and he called upon Buell with importunity for sufficient help to make sure work of it. Buell's confidence also seems to have been very weak; for, commanding 72,502 men,—46,150 of them "in the field,"—he could only bring himself to send a single brigade* to aid in a work which he had described as of such momentous consequence. Afterward, indeed, he sent eight regiments more; but these were not from his 70,000 in the field. They were raw troops from Ohio and Indiana, which McClellan, with curious misconception of their usefulness, had ordered to Buell, who did not need them, instead of to Halleck, who was trying to make every man do double duty.

Out of this uncertainty about the final result at Fort Henry, the indecision of Buell's character becomes deplorably manifest. McClellan, satisfied that Buell could not advance against Johnston's force at Bowling Green over the difficult winter roads, and having not yet heard of the surrender of Fort Henry, suggested to both Buell and Halleck the temporary suspension of operations on other lines in order to make a quick combined movement up the Tennessee and the Cumberland. This was on February 6. Buell's fancy at first caught at the proposal, for he replied that evening:

This whole move, right in its strategical bearing, but commenced by General Halleck without appreciation, preparative or concert, has now become of vast magnitude. I was myself thinking of a change of the line to support it when I received your dispatch. It will have to be made in the face of 50,000, if not 60,000 men, and is hazardous. I will answer definitely in the morning.†

Halleck was more positive in his convictions. He telegraphed to McClellan on the same day:

If you can give me, in addition to what I have in this department, 10,000 men, I will take Fort Henry, cut the enemy's line, and paralyze Columbus. Give me 25,000, and I will threaten Nashville and cut off railroad communication, so as to force the enemy to abandon Bowling Green without a battle.

News of the fall of Fort Henry having been received at Washington, McClellan twenty-four hours later telegraphed to Halleck: "Either Buell or yourself should soon go to the scene of operations. Why not have Buell take the line of [the] Tennessee and operate on Nashville, while your troops turn Columbus? These two points gained, a combined movement on Memphis will be next in order." The dispatch was in substance repeated to Buell, who by this time thought he had made up his mind, for two hours later he answered: "I cannot, on reflection, think a change of my line would be advisable. . . . I hope General Grant will not require further reinforcements. I will go if necessary." Thus on the night of the 7th, with the single drilled brigade from Green River and the eight raw regiments from Ohio and Indiana, he proposed to leave the important central line on which Grant had started to its chances.

A night's reflection made him doubt the correctness of his decision, for he telegraphed on the morning of the 8th, "I am concentrating and preparing, but will not decide definitely yet." Halleck's views were less changeable: at noon on the 8th, he again urged that Buell should transfer the bulk of his forces to the Cumberland River, to move by water on Nashville. To secure this coöperation, he further proposed a modification of department lines to give Buell command on the Cumberland and Hitchcock or Sherman on the Tennessee, with superior command for himself over both.

No immediate response came from Washington, and three days elapsed when Halleck asked Buell specifically: "Can't you come with all your available forces and command the column up the Cumberland? I shall go to the Tennessee this week."‡ Buell's desire, vibrating like a pendulum between the two brilliant opportunities before him, now swings towards Halleck's proposal, but with provoking indefiniteness and fatal slowness. He answers that he will go either to the Cumberland or to the Tennessee, but that it will require ten days to transfer his troops.§ In this emergency,

‡ Halleck to Buell, Feb. 11, 1862. War Records.

§ Buell to Halleck, Feb. 12, 1862. War Records.

when hours counted as weeks, Buell showed himself almost as helpless and useless as a dismayed ship, rolling uneasily and idly in the trough of the sea. With, by this time, nearly 100,000 men* in the field, and with certainly a larger proportion of drilled and instructed regiments than could be found either in the camp of Grant or in the camps of the enemy, he could not make himself felt in any direction; he would neither attack the enemy in front nor send decisive help to Grant. He gives forth the everlasting cry of preparation, of delay, of danger.

During his painful hesitation, events forced him to a new conclusion. News came that the rebels had evacuated Bowling Green, and he telegraphed:

The evacuation of Bowling Green, leaving the way open to Nashville, makes it proper to resume my original plan. I shall advance on Nashville with all the speed I can.

From this last determination, Halleck appealed beseechingly to the General-in-Chief. He announced that Grant had formally invested Fort Donelson and that the bombardment was progressing favorably, but he further explained that since the evacuation of Bowling Green, the enemy were concentrating against Grant. He claimed that it was bad strategy for Buell to advance on Nashville over broken bridges and bad roads, and this point he reiterated with emphasis. He telegraphed on February 16:

I am still decidedly of the opinion that Buell should not advance on Nashville, but come to the Cumberland with his available forces. United to Grant we can take and hold Fort Donelson and Clarksville, and by another central movement cut off both Columbus and Nashville. . . . Unless we can take Fort Donelson very soon we shall have the whole force of the enemy on us. Fort Donelson is the turning-point of the war, and we must take it, at whatever sacrifice.

But his appeal was unavailing. McClellan took sides with Buell, insisting that to occupy Nashville would be most decisive. Buell had, indeed, ordered Nelson's division to go to the help of Grant; but in the conflict of his own doubts and intentions the orders had been so tardy that Nelson's embarkation was only beginning on the day when Donelson surrendered. McClellan's further conditional order to Buell, to help Grant if it were necessary, offered

a yet more distant prospect of success. If the siege of Donelson had been prolonged, assistance from these directions would of course have been found useful. In the actual state of facts, however, they show both Buell and McClellan incapable, even under continued pressure, of seizing and utilizing the fleeting chances of war which so often turn the scale of success, and which so distinctly call out the higher quality of military leadership.

Amidst the sluggish counsels of commanders of departments, the energy of Grant and the courage and intrepidity of his raw Western soldiers had already decided one of the great crises of the war. Grant had announced to Halleck that he would storm Fort Donelson on the 8th of February, but he failed to count one of the chances of delay. "I contemplated taking Fort Donelson to-day with infantry and cavalry alone," reported he, "but all my troops may be kept busily engaged in saving what we now have from the rapidly rising waters."† This detention served to change the whole character of the undertaking. If he could have marched and attacked on the 8th, he would have found but 6000 men in the fort, which his own troops largely outnumbered; as it turned out, the half of Johnston's army sent from Bowling Green and other points, conducted by Generals Pillow, Floyd, and Buckner, arrived before the fort was invested, increasing the garrison to an aggregate of 17,000 and greatly extending the lines of rifle-pits and other defenses.‡ This presented an altogether different and more serious problem. The enemy before Grant was now, if not superior, at least equal in numbers, and had besides the protection of a large and well-constructed earth-work, armed with seventeen heavy and forty-eight field-guns. It is probable that this changed aspect of affairs was not immediately known to him; if it was, he depended on the reinforcements which Halleck had promised, and which soon began to arrive. Early on the morning of the 12th he started on his march, with the divisions of McClernand and Smith, numbering 15,000. At noon they were within two miles of Donelson. That afternoon and all the following day, February 13, were occupied in driving in the rebel pickets, finding the approaches, and drawing the lines of investment around the

* The following is the force in the whole of the late Department of the Ohio, as nearly as can be ascertained at present: 92 regiments infantry, 60,882 for duty; 79,334 aggregate, present and absent. 11 regiments, 1 battalion, and 7 detached companies cavalry, 9222 for duty; 11,496 aggregate, present and absent. 23 field and 2 siege batteries, 3368 for duty; 3953 aggregate, present and absent. [Buell to Thomas, February 14, 1862. War Records.]

† Grant to Cullum, February 8, 1862. War Records.

‡ General Grant's estimate of the Confederate forces is 21,000. He says he marched against the fort with but 15,000, but that he received reinforcements before the attack, and their continued arrival had, at the time of the surrender, increased his army to about 27,000. Grant, "Personal Memoirs," Vol. I., pp. 299 and 315.

fort. A gallant storming assault by four Illinois regiments upon one of the rebel batteries was an exciting incident of the afternoon's advance, but was unsuccessful.

To understand the full merit of the final achievement, the conditions under which the siege of Donelson was thus begun must be briefly mentioned. The principal fort, or earth-work which bore the military name, lay on the west bank of the Cumberland River, half a mile north of the little town of Dover. The fort occupied the terminal knoll of a high ridge ending in the angle between the river and the mouth of Hickman Creek. This main work consisted of two batteries of heavy guns, primarily designed to control the river navigation. But when General Johnston resolved to defend Nashville at Donelson and gathered an army of 17,000 men for the purpose, the original fort and the town of Dover, and all the intervening space, were inclosed by a long, irregular line of rifle-pits connecting more substantial breastworks and embankments on the favorable elevations, in which field-batteries were planted; the whole chain of intrenchments, extending from Hickman Creek on the north till it inclosed the town of Dover on the south, having a total length of about two and a half miles. Outside the rifle-pits were the usual obstructions of felled trees and abatis, forming an interlacing barrier difficult to penetrate.

The Union troops had had no fighting at Fort Henry; at that place the gun-boats had done the whole work. The debarkation on the Tennessee, the reconnaissance, the march towards Donelson, the picket skirmishing during the 12th and 13th, had only been such as to give them zest and exhilaration. When, on the morning of the 12th, the march began, the weather was mild and agreeable; but on the afternoon of the 13th, while the army was stretching itself cautiously around the rebel intrenchments, the thermometer suddenly went down, a winter storm set in with rain, snow, sleet, ice, and a piercing north-west wind, that made the men lament the imprudence they had committed in leaving overcoats and blankets behind. Grant's army was composed entirely of Western regiments; fifteen from the single State of Illinois, and a further aggregate of seventeen from the States of Kentucky, Ohio, Indiana, Missouri, and Iowa. Some of these regiments had seen guerrilla fighting in Missouri, some had been through the battle of Belmont, but many were new to the privations and dangers of an active campaign. Nearly all the officers came from civil life; but a common thought, energy, and will animated the whole mass. It was neither discipline nor mere military ambition; it was

patriot work in its noblest and purest form. They had left their homes and varied peaceful occupations to defend the Government and put down rebellion. They were in the flush and exaltation of a common heroic impulse: in such a mood, the rawest recruit was as brave as the oldest veteran; and in this spirit they endured hunger and cold, faced snow and ice, held tenaciously the lines of the siege, climbed without flinching through the tangled abatis, and advanced into the deadly fire from the rifle-pits with a purpose and a devotion never excelled by soldiers of any nation or epoch.

Flag-Officer Foote, with six gun-boats, arrived the evening of the 13th; also six regiments sent by water. Fort Henry had been reduced by the gun-boats alone, and it was resolved first to try the effect of these new and powerful fighting machines upon the works of Donelson. Accordingly on Friday, February 14, the assault was begun by an attack from the six gun-boats. As before, the situation of the fort enabled the four iron-clads to advance up-stream towards the batteries, the engines holding them steadily against the swift current, presenting their heavily plated bows as a target for the enemy. The attack had lasted an hour and a half. The iron-clads were within 400 yards of the rebel embankments, the heavy armor was successfully resisting the shot and shell from the fort, the fire of the enemy was slackening, indicating that the water-batteries were becoming untenable, when two of the gun-boats were suddenly disabled and drifted out of the fight, one having her wheel carried away, and the other her tiller-ropes damaged.

These accidents, due to the weakness and exposure of the pilot-houses, compelled a cessation of the river attack and a withdrawal of the gun-boats for repairs, and gave the beleaguered garrison corresponding exultation and confidence. Flag-Officer Foote had been wounded in the attack, and deeming it necessary to take his disabled vessels temporarily back to Cairo, he requested Grant to visit him for consultation. Grant therefore went on board one of the gun-boats before dawn on the morning of the 15th, and it was arranged between the commanders that he should perfect his lines and hold the fort in siege until Foote could return from Cairo to assist in renewing the attack.

During all this time there had been a fluctuation of fear and hope in the garrison — from the repulse of McClernand's assault on the 13th, the prompt investment of the fort, the gun-boat attack and its repulse. There was want of harmony between Floyd, Pillow, and Buckner, the three commanders within the fort.

Prior to the gun-boat attack a bold sortie was resolved upon, which project was, however, abandoned through the orders or non-compliance of Pillow. That night the second council of war determined to make a serious effort to extricate the garrison. At 6 o'clock on the morning of the 15th the divisions of Pillow and Buckner moved out to attack McClelland's division, and if possible open an avenue of retreat by the road running southward from Dover to Charlotte. The Confederates made their attack not only with spirit but with superior numbers. Driving back McClelland's right, they were by 11 o'clock in the forenoon in complete possession of the coveted Charlotte road. Buckner, who simultaneously attacked McClelland's left, did not fare so well. He was repulsed, and compelled to retire to the intrenchments from which he had issued. At this critical point Grant returned from his visit to Foote. What he found and what he did is stated with brevity in the message he hastily sent back:

If all the gun-boats that can will immediately make their appearance to the enemy it may secure us a victory. Otherwise all may be defeated. A terrible conflict ensued in my absence, which has demoralized a portion of my command, and I think the enemy is much more so. If the gun-boats do not show themselves, it will reassure the enemy and still further demoralize our troops. I must order a charge, to save appearances. I do not expect the gun-boats to go into action, but to make appearance and throw a few shells at long range.*

In execution of the design here announced, Grant sent an order to General C. F. Smith, commanding the second division, who held the extreme left of the investing line, to storm the intrenchments in front of him. His men had as yet had no severe fighting, and now went forward enthusiastically to their allotted task, carrying an important outwork with impetuous gallantry. Learning of his success, Grant in turn ordered forward the entire remainder of his force under Wallace and McClelland. This order was also executed during the afternoon, and by nightfall the whole of the ground lost by the enemy's morning attack was fully regained. There is a conflict of testimony about the object of the attack of the enemy. Buckner says it was to effect the immediate escape of the garrison; Pillow says he had no such understanding, and that neither he nor any one else made preparation for departure. The opportunity, therefore, which his division had during the forenoon to retire by the open road to Charlotte was not improved. By evening the chance was gone, for the Federals had once more closed that avenue of escape.

* Grant to Foote, Feb. 15, 1862. War Records.

During the night of the 15th, the Confederate commanders met in council to decide what they should do. Buckner, the junior, very emphatically gave the others to understand that the situation of the garrison was desperate, and that it would require but an hour or two of assault on the next morning to capture his portion of the defenses. Such a contingency left them no practical alternative. Floyd and Pillow, however, had exaggerated ideas of the personal danger they would be in from the Government if they permitted themselves to become prisoners, and made known their great solicitude to get away. An agreement was therefore reached through which Floyd, the senior general, first turned over his command to Pillow; then Pillow, the second in command, in the same way relinquished his authority to Buckner, the junior general. This formality completed, Floyd and Pillow made hasty preparations, and taking advantage of the arrival of a rebel steamer boarded it, with their personal followers, during the night, and abandoned the fort and its garrison.

As usual, the active correspondents of Western newspapers were with the expedition, and through their telegrams something of the varying fortunes of the Kentucky campaign and the Donelson siege had become known to the country, while President Lincoln at Washington gleaned still further details from the scattering official reports which came to the War Department through army channels. His urgent admonitions to Buell and Halleck in the previous month to bring about efficient coöperation have already been related. The new and exciting events again aroused his most intense solicitude, and prompted him to send the following suggestion by telegraph to Halleck:

You have Fort Donelson safe, unless Grant shall be overwhelmed from outside, to prevent which latter will, I think, require all the vigilance, energy, and skill of yourself and Buell, acting in full coöperation. Columbus will not get at Grant, but the force from Bowling Green will. They hold the railroad from Bowling Green to within a few miles of Fort Donelson, with the bridge at Clarksville undisturbed. It is unsafe to rely that they will not dare to expose Nashville to Buell. A small part of their force can retire slowly towards Nashville, breaking up the railroad as they go, and keep Buell out of that city twenty days. Meantime Nashville will be abundantly defended by forces from all South and perhaps from here at Manassas. Could not a cavalry force from General Thomas on the Upper Cumberland dash across, almost unresisted, and cut the railroad at or near Knoxville, Tennessee? In the midst of a bombardment at Fort Donelson, why could not a gun-boat run up and destroy the bridge at Clarksville? Our success or failure at Fort Donelson is vastly important, and I beg you to put your soul in the effort. I send a copy of this to Buell.

Before this telegram reached its destination, the siege of Donelson was terminated.

On Sunday morning, the 16th of February, when the troops composing the Federal line of investment were preparing for a final assault, a note came from Buckner to Grant, proposing an armistice to arrange terms of capitulation. The language of Grant's reply served to crown the fame of his achievement:

Yours of this date, proposing armistice and appointment of commissioners to settle terms of capitulation, is just received. No terms except unconditional and immediate surrender can be accepted. I propose to move immediately upon your works.

His resolute phrase gained him a prouder title than was ever bestowed by knightly accolade. Thereafter, the army and the country, with a fanciful play upon the initials of his name, spoke of him as "Unconditional Surrender Grant." Buckner had no other balm for the sting of his defeat than to say that Grant's terms were ungenerous and unchivalric, but the necessity compelled him to accept them. That day Grant was enabled to telegraph to Halleck:

We have taken Fort Donelson and from 12,000 to 15,000 prisoners, including Generals Buckner and Bushrod R. Johnson; also about 20,000 stand of

arms, 48 pieces of artillery, 17 heavy guns, from 2000 to 4000 horses, and large quantities of commissary stores.

By this brilliant and important victory Grant's fame sprang suddenly into full and universal recognition. Congress was in session at Washington; his personal friend and representative, Hon. Elihu B. Washburne, member from the Galena district of Illinois, lost no time in proposing a resolution of thanks to Grant and his army, which was voted without delay and with generous gratitude. With even more heartiness, President Lincoln nominated him major-general of volunteers, and the Senate at once confirmed the appointment. The whole military service felt the inspiring event. Many of the colonels in Grant's army were made brigadier-generals; and promotion ran, like a quickening leaven, through the whole organization. Halleck also reminded the Government of his desire for larger power. "Make Buell, Grant, and Pope major-generals of volunteers," he telegraphed the day after the surrender, "and give me command in the West. I ask this in return for Forts Henry and Donelson."

LINCOLN CATHEDRAL.

SEAL OF THE SEE OF LINCOLN.

NO man by taking thought can add a cubit to his stature, but dignity of carriage and a masterful air may accomplish many inches; — the yard-stick bears false witness to a Louis Quatorze, a Napoleon, or a Nelson. And as it is with men, so it is with cities. Canterbury counts twenty thousand souls and looks small, weak, and rural. Lincoln counts only a few thousand more, but, domineering on its hill-top, makes so brave a show of municipal pride, has so truculent an air and attitude, that no tourist thinks to patronize it as a mere provincial town. It is a city to his eye; and the greatness of its church simply accentuates the fact. Canterbury's cathedral almost crushes Canterbury, asleep in its broad vale. Durham's rock-borne minster projects so boldly from the town behind it that it still seems what it really was in early years —

at once the master of Durham and its bulwark against aggression. But Lincoln's church, though quite as big and as imperial as the others, seems but the crown and finish of the city which bears it aloft in a close, sturdy grasp. Like Durham cathedral, it stands on a promontory beneath which runs a river. But the hill is very much higher, and the town, instead of spreading away behind the church, tumbles steeply down the hill and far out beyond the stream. Here for the first time in England we feel as we almost always do in continental countries — not that the cathedral church has gathered a city about it, but that the city has built a cathedral church for its own glory and profit.

I.

In truth, the importance of Lincoln as a town long antedates its importance as an ecclesiastical center. We cannot read far enough back in its history to find a record of its birth. When the Romans came — calling it *Lindum*

Colonia, making it mark the meeting-place of two of their great roads, and fortifying it as one of their chief stations—a British town was already lying a little to the northward of the spot they chose. After their departure and the coming of the English, Lindum flourished again, and still more conspicuously when the Danes took and kept it. At the advent of William the Norman it was one of the four chief towns in England, ruled in almost entire independence by a Danish oligarchy of twelve hereditary “lawmen,” and containing 1150 inhabited houses, many of them mansions according to the standard of the age. William came from the north after his conquest of York and probably entered by that Roman gate-way which still stands not far from the cathedral; and with his coming began a new and yet more prosperous era for the town. In one corner of the

from Paulinus, the famous archbishop of the north, and was at first included in the wide diocese of Lichfield. In 678 a new see was formed which was called of Lindsey after the province, or of Sidnacester after the episcopal town—probably the modern town of Stow. Two years later it was divided, another chair being set up at Leicester. About the year 870 this chair was removed to Dorchester, and hither about 950 the chair of Sidnacester was likewise brought. When the Normans took control the chief place of the united sees was changed again, Lincoln being chosen because of that dominant station and that civic importance which to continental eyes seemed characteristic of the episcopal name.

II.

REMIGIUS was the first Norman bishop of Dorchester, the first bishop of Lincoln; and about the year 1075, “in a place strong and fair,” he began “a strong and fair church to the Virgin of virgins, which was both pleasant to God’s servants and, as the time required, invincible to his enemies”; and he gave it in charge to secular canons, although he was himself a Benedictine. It was injured by a great fire in 1141, quickly repaired by Bishop Alexander in the later Norman style, and then almost utterly destroyed in 1185 by an earthquake which “split it in two from top to bottom.” Nothing remains of the first cathedral of Lincoln to-day except a portion of Remigius’s west-front (built into the vast Early-English façade), and the lower stages of the western towers, which, like the doorways in the front itself, were parts of Alexander’s reconstructions.

Bishop Hugh of Avalon or of Burgundy—in the calendar, St. Hugh of Lincoln—began the present church, building the choir, the minor transepts, and a piece of the great transepts; and his immediate successors, by the middle of the thirteenth century, had completed these transepts, together with the nave, the west façade and its turrets and chapels, the great

Roman inclosure a great Norman castle soon began to rear its walls, and in another corner the first Norman bishop laid the foundations of a vast cathedral church.

This part of England had received the gospel

Galilee-porch on the southern side, the vestry, the chapter-house, and the two lower stories of the central tower. These parts are all still the same and are all in the Lancet-Pointed (Early-English) style. The presbytery beyond the minor transepts—the famous “Angel Choir”—was built between 1255 and 1280, the cloisters before 1300, and the upper stages of the central tower immediately after, all in the Decorated style. The

and Perpendicular art brings its accent into the majestic whole.

111.

If the traveler is wise he will not choose a hostelry in the lower part of the town, for it is a long walk thence to the cathedral, and a walk that means a climb up the steepest streets I saw in England. Fortunately there is a very good inn just beyond the cathedral precincts, within the precincts of the old Roman

THE EXCHEQUER GATE AND THE WEST-FRONT OF THE CATHEDRAL.

earliest Perpendicular manner—close akin to the latest Decorated—is revealed in the upper stories of the western towers; and in many of the older portions of the church both Decorated and Perpendicular windows were inserted.

The church of Lincoln is thus a most interesting one to study after we have been at Salisbury and Lichfield. At Salisbury we found a church wholly in the Early-English manner with a Decorated spire. At Lichfield we found one almost wholly in the Decorated manner with Early-English transepts. At Lincoln Lancet-Pointed work is again preponderant, but Decorated work is very conspicuous and singularly fine, Norman features still remain.

VOL. XXXVI.—81.

station. As we leave its door we turn a corner, where a curious half-timbered house overhangs the street, and see to the westward the Roman gate and the Norman castle, and to the eastward the “Exchequer Gate,” a tall three-storied structure of the Decorated period. This admits us into a small paved square—the Minster Yard—surrounded on three sides by low ecclesiastical dwellings. Filling the whole of the fourth side, just in front of us, rises the enormous façade of the church, peculiarly English in conception, and individual in its naïve incorporation of inharmonious Norman features.

The front which remained after the earthquake—with five great, round-arched re-

THE FAÇADE FROM THE MINSTER YARD.

cesses of graduated height, three of them inclosing low, round-arched portals — was made the nucleus of the new façade. Wide wings finished by turrets were thrown out on each side of it and a high reach of wall was built up above, all covered with Lancet-Pointed arcades in close-set rows; and to bring some semblance of unity into the effect, the round top of the tall central recess was altered into a pointed shape and surmounted by an arcaded gable.

What are we to say of such a front as this? It is not a design in any true sense of the word, and we may believe that it would not have been even had the architect been unhampered by the Norman wall. Like the contemporary façade at Salisbury, which was built under no constraint, the newer part is simply a huge screen, misrepresenting the breadth, and still more grossly the height, of the church behind it; and even as a screen it is ungraceful in outline and weak in composition — elaborately decorated, but almost devoid of architectural sinew and bone. When we study it on paper there is only one verdict to give — a very big piece of work but a very bad one. Yet when we stand in its mighty shadow our indictment

weakens. Then we see how hugely big it is and how its bigness — its towering, frowning, massive, and imperious air — redeems its lack of dignity in design. We see that its great Norman arches preserve their due importance despite the wide fields of alien work around them. We see that although the towers behind it have no true connection with its mass, they yet supplement that mass superbly. We see that the endless repetition of similar niches is at least a successful decorative device, greatly to be preferred to such a counterfeit of architectural designing as the blank windows of the Salisbury façade; — although on paper they may seem but to reveal a want of inventive power, in actuality they give a wonderful effect of repose combined with richness. In short, we see, when face to face with Lincoln, that there may be such a thing in architecture as successful sin — that if a bad piece of work is only big and bold enough it may appear wholly grand and almost beautiful. The front of Lincoln is not a good church-front. It is not an organic composition. It is not even a very clever attempt to unite alien elements in an harmonious whole. But all the same it is a splendid stretch of wall, and one which

gives the observer an emotion such as stirs him very seldom when he views an English cathedral from the west.

IV.

BENEATH the central arch we enter a square porch out of which opens on each hand another of smaller size. Lying under the Norman towers these porches are Norman in body themselves, but are covered with Perpendicular vaults, lined with Perpendicular carvings, and encumbered by eighteenth-century constructions which the tottering state of the

arches between them are so widely spread, that the effect of the long perspective is a little too open and empty, and the triforium seems a little too heavy by contrast. The vaulting, moreover, is far from satisfactory. Diverging ribs in fan-like groups start from each vaulting-shaft and end at equal intervals along a longitudinal mid-rib. The effect of such a design (a common one in large English churches) is never so pleasing as that of a design which shows transverse ribs spanning the nave from shaft to shaft with diagonal ribs crossing between them; for it accords less logically with walls that are conspicuously

THE SOUTH SIDE OF THE CATHEDRAL.

towers prescribed. Beyond them lie large chapels, forming the Early-English wings of the façade; and behind these but unconnected with them, and divided from the nave-aisles by a low wall only, are again two chapels of a somewhat later date.

The nave itself is more richly adorned than the contemporary Early-English nave at Salisbury, and is more majestic than the still richer Decorated nave at Lichfield. But its piers are so widely spaced and, in consequence, the

divided into compartments, it accentuates length too evidently, and its great conical masses have a heavy and crushing look. The lower the church, the more these faults offend; and Lincoln is very low indeed. Its nave is but eighty feet in height and its choir is eight feet lower still.

The central tower opens above the crossing as a lofty lantern. Its lower stages were built early in the thirteenth century, but almost immediately fell, to be at once rebuilt,

before the year 1250, in exact repetition of the first design.

The most noteworthy features in the great transept are the two rose-windows which, close beneath the vaulting, face each other across its length — the “Bishop’s Eye” shining at the southern end and overlooking “the quar-

that surrounds them. The “Bishop’s Eye” dates from about 1330, when the Decorated style was no longer young and had passed from its “geometrical” into its “flowing” stage. In design it does not deserve unstinted praise, for its shape is not strongly enough accentuated by the main lines of the traceries.

ON THE BANKS OF THE WITHAM.

ter of the Holy Spirit” to invite its influence, the “Dean’s Eye” shining at the northern end and watching “the region of Lucifer” to guard against his advances. Circular windows of later than a Norman date are not very common in England, and when we see how beautiful are these and how interesting in their contrast, we do not wonder that their fame is wide.

The “Dean’s Eye” is an Early-English window of about 1220,—a wheel-window rather than a rose, a perfect example of plate-tracery applied to a round opening. The stone-work is light and graceful, but it is a flat plate pierced, not an assemblage of curved and molded bars; and the design which impresses itself upon the eye — the pattern which makes the window’s beauty — is formed by the openings themselves, not by the stone-work

But apart from this want of perfect adaptation, the traceries are very beautiful; and no one can mistake the share they play in the effect of the window. The pattern which makes the beauty of this window is not encircled by the delicate bars of stone, but is composed by these bars. The plate-traceried window (if I may repeat a phrase already used in a similar connection *) appears as a beautiful design done in large spots of light upon an opaque ground. The true traceried window appears as a beautiful design etched in black upon a luminous ground. Fortunately, both the luminous pattern in the Dean’s window and the luminous background in the Bishop’s are still formed by ancient glass, royally magnificent in color.

THE CATHEDRAL FROM THE POOL.

V.

THE original choir-screen—or, at least, a rich and massive choir-screen of the Decorated period, a veritable bit of wall—still stands at Lincoln between the angle-piers to the eastward of the crossing. Only when we enter beneath its doorway is the full glory of the vast east-limb revealed. Two distinct designs unite in harmony in this east-limb—St. Hugh's Early-English design of the choir proper and the later Decorated design of the so-called Angel Choir beyond the minor transepts.*

No fiercer architectural battle has ever been fought than the one for which the choir of St. Hugh has supplied the field. The question at issue is one which appeals to something more than cold antiquarian curiosity. When it is asked whether the choir of Lincoln may rightly be called "the earliest piece of pure Gothic work in the world," how shall national pride, international prejudice and jealousy, fail of

their effect upon the answer? In truth, they have variously tinged so many different answers that in reading about this choir we almost feel as though no point in the history of medieval art had been accurately established nor the relative value of any of its characteristics definitely appraised. But it is just this fact which gives the subject its interest for the transatlantic traveler. He might care little about the claims set up for Lincoln if they were merely claims between English church and church. But it is worth his while to try to understand them for the sake of better understanding how the course of architectural development varied between land and land.

It is impossible to formulate a definition of "pure Gothic" work which would satisfy both sides of the Channel. If we were to say both *pure* and *complete*, and speak in a very abstract way, we might, no doubt, succeed. But it is difficult to give even an abstract definition of purity alone, leaving completeness out of sight—for a mere lack of some one char-

* As will be seen from the plan, the "ritual choir" with the high-altar at its eastern end is carried beyond these transepts; but, architecturally speaking, the space beyond them forms, first the presbytery and then the

retro-choir. Architecturally speaking the Angel Choir is not the choir of Lincoln, but a vast accessory space constructed, as so often, to meet the needs of relic-worship.

THE CATHEDRAL FROM THE HIGH STREET.

acteristic is, in the eyes of many, as great a blot, as conspicuous a mark of the Transitional stage, as the presence of an alien characteristic. And in any case it is hard to make theories—theories in which taste must come to the aid of logic in many decisions—fit so complicated a development as that of Pointed architecture. Whether a feature or detail is perfectly pure, perfectly harmonious with the Gothic ideal, or only approximately pure, only Transitional;

which features and details are of prime and which of secondary importance; how many, if any at all, that are not perfectly pure may consist with a general effect which is entitled to the perfect name—all these are questions that arise in ever-changing application as we pass from church to church, and that men must answer differently in accordance with those æsthetic leanings which, among Europeans, are often merely ingrained prepos-

sions for familiar local types. The best thing an American can do is to notice just how Frenchmen worked in the year 1200 and just how Englishmen worked; and then, if he cares for cut-and-dried beliefs, to decide for himself which of them it was whose work was purest.

To the mind of a French architect in the year 1200 the chief essential, I should say, was the general impression which his building would produce; and this, he felt, depended more upon its proportions and the shape and disposition of its main constructional elements than upon details of form and decoration. It seemed to him much more important that his church should be very lofty and that all its stories should form inseparable parts of a single architectural conception, than that no round arch should appear even in those minor situations where its shape could not affect the structural design. He did not feel, as English critics say he should have felt, that his result would be inharmonious if the square abacus, instead of the round or polygonal abacus, were used in the capitals of his piers; or if some of these piers were simply columnar — were devoid of attached shafts or moldings. But he did feel that his vaulting-shafts should be integrally united in some way with the piers, while even above the most richly molded pier an Englishman could contentedly let his vaulting-shafts be borne by independent corbels. He was not so quick as the Englishman to see that the more complicated new system of construction required more complicated sections for jamb and arch-line, and that the effect would be more harmonious were these sections gently rounded instead of being square and sharp. But he more quickly saw that the greater importance which the new system of vaulting gave to the chief points of support decreased the importance of the walls between them; that this fact ought to be explained, and that wide windows filled with traceries explained it more fully than mere groups of lancets. And a church in the Pointed style unvaulted, covered by a level ceiling, would have seemed to him the negation of all good sense and taste. Occidental builders had first used the Pointed arch in their vaults, in answer to the constructional necessity for making curves of different lengths meet at a common height. From the vault it had descended to the other portions of the fabric, in answer to the æsthetic need for harmony and the growing wish for altitude and

vertical accentuation. From there it had worked with creative touch to guide the new development and dictate its every feature. How, then, could it be omitted there, in a work in the new style, except by committing a patent sin against constructional logic on the one hand, purity of æsthetic effect on the other?

Let us look now at the choir of Lincoln and see in what its purity consists. All its arches are pointed. The great piers of the main arcade are richly shafted, and the lesser piers of the triforium still more richly. All the sections are defined by complex and gently rounded moldings. All the main capitals have the round abacus, and where it does not occur a polygonal form is used; and all the sculptured foliage is of that true Early-English type which is so markedly distinct from any type of Romanesque — upright stalks encircle the capital and bear coronals of curling leaves.

If this choir was really built when English critics (apparently with clear facts to back them) say it was — just before the year 1200 — it is certainly both purer and richer in detail than any contemporary work in France.* But does this mean that it is purer in general effect, more truly and distinctively Gothic in feeling, farther on the path towards that stage in development which means perfect purity and completeness both — the entire as well as the impeccable realization of the highest Gothic ideal?

There are many reasons why a French critic may well answer, No. Although all its arches are pointed, those of the main arcade are so very slightly pointed that their effect differs to a scarcely perceptible degree from the effect of semicircles, and those of the triforium are but a trifle more acute, so that these two stories might be rebuilt with round arches and yet their proportions remain the same — their design, constructionally considered, be almost unchanged. Again, the sweep of the vault is so low and its diverging ribs bear so little relation to the design of the wall-compartments, that it seems rather to crush the choir than to soar above it, and actually conflicts with that expression of verticality which should be the animating spirit of every line in a work of Pointed architecture. Moreover, we are told by some authorities that even this vault was not built until after the fall of the tower — that a ceiling of flat boards was the covering St. Hugh bestowed

* It would be hopeless in the space here at command to report the various opinions which have been advanced with regard to the exact age of this work or the degree to which it was affected by foreign example. Even among English critics there are one or two who doubt whether the whole choir was built by St. Hugh, although all agree that it was purely English in its

origin. Among foreign critics many have asserted some continental influence imported by St. Hugh or by his architect, while Viollet-le-Duc declares that everything is purely English, but decides, therefore, that the year 1200 must have seen the beginning rather than the completing of the work.

ONE BAY OF THE ANGEL CHOIR.

upon his choir. If this be true then a contemporary Frenchman might well have called it incomplete in style, inharmonious in effect, and thought its purity and perfection of detail matters of secondary moment. And even if it be not true, he might still have been willing to point to churches of his own and ask impartiality to decide whether they were not further on the road to complete purity than St. Hugh's.

If we look at the nave of Noyon Cathedral, for instance,—which I choose because it was built some thirty years before the earliest date claimed for the choir of Lincoln,—we see

a very much taller structure covered by a vault of soaring effect designed in intimate accord with the wall-design. In the main arcade we find columns alternating with true piers. But these true piers are beautifully shafted and molded; they rise in unbroken lines to the base of the clerestory windows; here their capitals are matched by the capitals of the vaulting-shafts which stand on the intermediate columns, and thus all the stories are united as parts of a single structural idea. Square sections everywhere appear in the arches, and round arches appear in the clerestory and in a little arcade which runs beneath it. But the arches of the two lower stories are very much taller and more sharply pointed than at Lincoln. It would be impossible to rebuild these stories without conspicuously altering either their height or the width of their bays, or leaving

in each a broad, plain field of wall—without tearing the whole design apart and producing a new design of utterly different aspect. In short, the constructional skeleton of Noyon's nave may be called much more purely or, at the very least, much more emphatically Gothic than the skeleton of Lincoln's choir, although the decorative integument at Lincoln is both more richly and more harmoniously developed.

However, the chief thing to remember in connection with this famous quarrel is that even if Lincoln be counted

"the earliest piece of pure Gothic work in the world," the fact cannot sustain the claim that English architects "invented" or "introduced" the Pointed style. This claim has often been made in the past and even now is sometimes made; but it is untenable to a point beyond the need for serious discussion. No facts in all architectural history are more certain than that in twelfth-century France—in the central districts of what we now call France, in the *domaine royal*, the province of the Ile-de-France—pointed arches were first used as the basis of a consistent architectural scheme, and that thence their use

was spread abroad, northward to England, eastward to Germany, southward to Italy and Spain. We need not go for dates in confirmation to the soil of France itself. We have seen the character of the late-Transitional choir at Canterbury and know how nearly it approaches to true Gothic in feature and effect; and we know that it was built by Frenchmen while Englishmen were building the Norman naves of Peterborough and Ely.

The most that can be claimed for English architects is that, after borrowing the new idea, they developed it in an independent way and, as regards certain forms and details, more rapidly than their Gallic rivals.

VI.

THE minor or eastern transepts of Lincoln belong also to the time of St. Hugh and show a lingering Norman influence in their polygonal chapels. Beyond them lies the Angel Choir, which was completed about the year 1280, in the noblest period of the Decorated style.

Few disparities between feature and feature now mark off English work from French, yet insular independence still speaks from the general effect.

THE CHOIR STALLS, LOOKING WEST.

The low proportions of the Angel Choir suffice to make it almost as unlike any contemporary foreign work as the choir of St. Hugh is unlike the nave of Noyon. Its beauty best appears when we study one of its bays in isolation, forgetting that it is a part of so immensely long a church. Then the design seems to have but a single fault—the vaulting-shafts are not integral, vital parts of it. Their supporting corbels are simply intruded between the main arches; and their capitals are intruded between the triforium arches, appearing as if the vault had pressed

them from their proper station on the clerestory string-course. So in truth it did, not in the actual stone, of course, but in the designer's thought. A vault of this form and height could not have started from a loftier point.

There is no Lady-Chapel at Lincoln; the whole cathedral was dedicated to the Blessed Virgin, as had been the church of an English congregation which occupied the site before the Normans came. The presbytery was built with its great retro-choir in honor of St. Hugh. Hither his wonder-working shrine was translated, with all pomp and circumstance, in the year 1280, being brought from the north-east transept and placed just back of the high-altar; and here he slept for centuries in a fame and sanctity greater than those which enwrapped any saint on English ground save Thomas of Canterbury alone.

To-day we look for his sepulcher in vain. Yet the allied besoms of destruction and restoration have passed with comparative lightness over Lincoln. Many other splendid tombs and chantries are preserved, often with much of their sculptured ornament intact. The Decorated stalls which encircle the choir

THE CENTRAL TOWER AND THE GALILEE-PORCH.

proper are of admirable workmanship and striking effect. The altar-screen is likewise of the Decorated period, although painfully restored. The blank arcades in the aisles seem surprisingly rich, even after one has seen those in the "Nine Altars" at Durham. The minor transepts are shut off from the choir by tall screens of iron tracery, lovely and yet vigorous as only hammered iron-work can be. Architectural carving is everywhere profuse and usually of the greatest beauty, and the figures in the triforium spandrels, which have given the Angel Choir its popular name, are of unique importance in English interior decoration. The effect of all this lavish adornment is greatly increased by the diversified plan of the structure, which at every step gives varying lights and shadows, new combinations of form, fresh perspectives with fresh accords and contrasts; and altogether the east-limb of Lincoln dwells in my mind as more richly pictorial in aspect than any part of any other English cathedral. Of course the mood of the moment has much to do with imprinting such impressions; yet I venture to record this one with the claim that it cannot be very far away from the truth.

VII.

BUT it is only when we pass outside the church again and make its mighty circuit that the full value of its complex plan and its rich adornment is made clear. I would not say that Lincoln is the most beautiful of English cathedrals inside. I am not quite sure that it is the most impressive outside when seen from a distance. But I am certain that it is the most beautiful and the most interesting outside when studied foot by foot under the shadow of its walls. It is more varied in outline and

THE SOUTH-EAST PORCH.

feature than Canterbury itself, and it is vastly more ornate.

Even the west-front is extraordinarily interesting in detail, especially in its Norman portions; and when we turn its southern shoulder, beauty and charm increase at every step. First we see the flanks of the Norman towers and on a line with them the low Early-English chapels; and then, set considerably back, the long stretch of the nave with lancet-windows and graceful flying-buttresses, a delicate arcade above the clerestory, and over this an open parapet bearing great canopied niches of the Decorated period. Then comes the side of the transept with the Galileeporch in bold projection—richly shafted, exquisitely vaulted, and peculiar by reason of its cruciform plan; then the transept-end where the Bishop's Eye looks out beneath a lofty gable; then a deep and shadowy re-

cess between this greater and the minor transept; then the projecting vestry, the gabled front of the minor transept with its beautiful lancet-groups, and another recess varied by the polygonal faces of the little lowly chapels; and then the buttresses and the traceried windows of the Angel Choir rising over a great pinnaced porch and two Perpendicular chantries. Carven ornament has been growing more and more profuse as we have passed

construction of some other chapter-house, confessing that the buttresses of this one show too clearly that they are later additions which merely rest against its walls. But the group as a whole is magnificent; and when we stand a little way off to the south-east so that we can encompass it in a single gaze with the perspective of the whole south-side—then indeed we may learn what architectural composition means.

THE EAST-END AND THE CHAPTER-HOUSE.

thus eastward from the earlier to the later work; and here in this south-eastern porch the climax is reached. There is no other large porch in a similar situation in England, and, I think, no porch at all which is so ornate in design.

Nor is there any falling off in beauty of general effect when we turn to the northward and view the east-end of the church and the polygonal chapter-house beyond. We may prefer the treatment of some other east-end, granting that here the upper window (which lights the space between the vaulting and the high-pitched outer roof) is so large that it injures the effect of the principal window, and that the aisle-gables are shams, representing nothing behind them; and we may prefer the

Low as are the vaulted ceilings of Lincoln, its outer roofs, in the six great arms formed by nave and choir and doubled transepts, are unusually high and steep; and, beautifully supported by the lesser roofs—lower in varying degree—of the many chapels, aisles, and porches, they as beautifully support the three tall towers. Far off to the westward rise the sturdy Norman pair with their delicate early-Perpendicular tops, harmonizing well with their greater brother—that central tower which is the crown in beauty as in constructional importance of the whole splendid pile. This late-Decorated central tower of Lincoln has but one real rival—the Perpendicular central tower of Canterbury. Built to bear a lofty wooden spire, while the Canterbury tower

was meant to be spireless from the first, it is nevertheless almost as fine in form, almost as superbly complete in its present spireless state, while in loveliness of feature and enrichment it is beyond compare.

VIII.

THERE is no such wide-spreading Close around Lincoln as around most English cathedrals, yet even here a green environment does not lack. Along the south side of the church runs a border of grass with a street beyond it, and the low walls of the Vicar's Court, flanked by ecclesiastical houses. To the eastward the grass stretches out into a wide lawn, again with a street as its boundary; and to the northward chapter-house and cloisters look on a still broader reach of turf.

The cloisters were from the first almost as purely ornamental, as little required by actual needs, as they are to-day; for there was never a monastic chapter at Lincoln. But whatever the chapter, a house for its councils was required; and a singularly beautiful one was built by the canons of Lincoln. It is decagonal in shape and about sixty feet in diameter, with a complex vault supported by a central pillar, from which the ribs diverge like palm-branches from a palm. There are other chapter-houses which resemble it in general design — as at Salisbury, Wells, and Westminster; but to my mind there is no other so perfect. Its proportions are faultless and the sweep of its ceiling is graceful beyond words. The central pier, with its circle of ten isolated marble shafts; the sharply pointed blank arcade, which surrounds its walls above the stone benches; the lancet windows, which in groups of two fill every face except the one that opens by its whole width into the stately vestibule; the rich vaulting-shafts, which rise between smaller blank lancets in every angle — all are perfect in themselves and in perfect harmony, in close architectural union, with each other. Whatever may be the case in their larger constructions, no one ever surpassed the English in constructions such as this. There is nothing lovelier in the world than this little interior, and there is nothing better as a work of Gothic art.

From the mere position of chapter-house and cloisters we might almost feel sure that they were not built as parts of a great monastic establishment, for in such an establishment their proper place would have been on the south side of the nave. Three sides of the cloisters still stand in their original Decorated form; but the north side, with the library above, was burned in the seventeenth century and was reconstructed by Sir Christopher Wren. Of course this piece of Renaissance work is out

of keeping with all else, yet it is not wholly unwelcome, for it adds to the historic interest of a richly historic spot. Where these cloisters stand once ran the wall of the Roman station, and within them are preserved fragments of a tessellated Roman floor. Beginning, therefore, with these fragments, running the eye over the huge, near body of the church, and then coming back to Sir Christopher's walls, we find signs and symbols of almost all the generations which make England's glory when she counts her treasures of art. There is but one great gap — no sign or token appears of that sturdy race of English builders who had their Church of Mary on this same spot between the going of the Roman and the coming of the Norman. "Saxons" or "Anglo-Saxons" these builders are popularly called, but they were the first Englishmen, the men of true, undiluted English blood. And if names were always applied in accordance with facts, the name of "Early-English architecture" would be given to their primitive round-arched work, and not to the Lancet-Pointed work of those thirteenth-century Englishmen whose blood was tinged with a Norman strain.

IX.

BUT if no relics of the first phase of English art remain in or about Lincoln Cathedral, down in the town of Lincoln we may find them. Here stand two tall church-towers, built in that primitive round-arched style which had once been used by all western Europe, which before the Conquest the Norman had already altered into another round-arched style of quite different aspect, but which the German was still employing. In Germany it was never abandoned — only developed — until it was exchanged for the Pointed style of France. But in England it was at once suppressed by the conquerors' style, and not out of it but out of the Norman style grew the Early-English Pointed. Here at Lincoln we may be almost sure that we see its last gasp for life; for these towers were built by an English colony from the upper town after the architects from over-sea had there begun the great cathedral-church.

Nor are these the only relics of remote antiquity in the low valley and steep, climbing streets of Lincoln. The trace of the Roman is everywhere; not in merely in excavated bits of pavement and carving, but in the great "Newport Gate" near castle and church, in the line of the far-stretching highways, in the twelve miles of "Foss Dyke" which, connecting the Witham with the Trent, still serve the purposes of commerce. And the trace of the Norman is still more plainly seen; not only in his hill-top church and castle, but in

several dwellings on the hill-side streets. All of these are yet in use and one of them still keeps, in its name of the "Jew's house," a record of the fact that few but Jews were able in the twelfth century to dwell in habitations of hewn and carven stone. Timbers sheltered the Christian citizen; only God and his priests and the Hebrew pariah could afford the costlier material.

The Jews, in truth, played as conspicuous and at times as martyr-like a rôle in medieval Lincoln as in medieval York. It would be interesting to tell of their dramatic persecution in the fourteenth century were there not in Lincoln's history so many chapters of still greater significance, and had not the architectural chapter been so long in the telling. The diocese was an immense one, even after the Normans set off Cambridgeshire to form the diocese of Ely, for besides its present territory it included, until Reformation times, what are now the sees of Peterborough and Oxford; and the size and strength of the episcopal city, and its situation in the center of England on the high road to the north, helped to insure the permanence of its early renown. Whether we look at its burghers' record or its bishops', there is never an age when great names and deeds are wanting.

Here, for example, King Stephen was defeated and imprisoned in 1141; here was a focus of conflict in the critical reign of King John, and again in the early tempestuous years of King Henry III.; here was a Royalist defense, a Parliamentary siege and triumph, in 1644; and always the burghers as a body were more influential actors than has often been the case on English soil.

Among the bishops who here held sway was first Remigius, the cathedral founder; then Robert Bloet, the chancellor of William Rufus, who was called akin in nature to his patron and thought to be rightly punished when "his sowle, with other walking spretes," was compelled to haunt the cathedral aisles; then Alexander, who repaired the church of Remigius, and, although "called a bishop, was a man of vast pomp and great boldness and audacity," and "gave himself up to military affairs" in the wars of Stephen. Then, after a long interregnum, came one who was never consecrated but enjoyed the temporalities of the see for seven years—Geoffrey Plantagenet, the illegitimate son of Henry II. From 1186 to 1200 ruled St. Hugh, the builder—perfect, we are told, in his daily life, and a model bishop before the world. Another Hugh, who came from Wells, soon followed him, and then in 1235, Robert Grosseteste, than whom no man of his time was more remarkable in himself or more conspicuously be-

fore the nation—a scholar, a builder, a stern disciplinarian in his diocese, and a bold-fronted upholder of the rights of the English Church against the king on the one hand and the pope on the other. Thus the list runs on, often a great name, never a quite inconspicuous one, until in the year 1395 we reach Henry Beaufort, afterwards Bishop of Winchester and Cardinal of Rome, immortalized in a rather unjust light by Shakspeare's hand. He was followed by Philip of Repington, at first an outspoken Wickliffite, then a truckling recanter, and, in consequence, a man whom princes delighted to honor; and he by Richard Fleming, who was the executive of the Roman Church in that act of the results of which the poet says:

The Avon to the Severn runs,
The Severn to the sea;
And Wickliffe's dust shall spread abroad,
Wide as the waters be.

Here at Lincoln, coming from the chair of Rochester, sat John Russell, who played an important political part just before Henry VII. gained the throne; and here for a twelve-month ere he went to York and became a cardinal, Henry VIII.'s ill-used great servant, Wolsey. After the Reformation, bishops of political fame everywhere grew fewer, but Lincoln's succession kept well to the front in the more peaceful walks of intellectual life, and furnished many archbishops to the neighboring chair at York. An honored name occurs in our own day—the name of Christopher Wordsworth, who was first canon and archdeacon at Westminster, and died as Bishop of Lincoln in 1885.

X.

THE south side of Lincoln, wrote Fuller, in his "Worthies" many generations since, "meets the travelers thereunto twenty miles off, so that their eyes are there many hours before their feet." We count by minutes now where Fuller counted by hours; yet they must be dull eyes to which Lincoln does not speak with entrancing power as the railroad crosses the flat wolds towards the base of the roof-piled hill, as they see it ever nearer and nearer, tremendously crowned yet not crushed by its three-towered church, until the encircling river is in the immediate foreground, until at last the church shows paramount as the rail is left and the steep and twisting streets are climbed.

Upon second thoughts I am inclined to say in very positive fashion that when thus beheld, and not only when beheld quite near at hand, Lincoln shows the finest exterior in England. Certainly Durham, apart from its environment, is not its peer, and Durham is

its only rival in dignity of site. Durham, intrinsically, is grand, majestic, and imposing; but Lincoln is all this and very beautiful as well. No other cathedral has so strong yet graceful a skyline, and no other so fine a group of spireless towers. Individually each tower may be surpassed elsewhere, but all three together they are matchless. Not even the knowledge that they once bore spires which now are gone hurts their air of perfect fitness to the church they finish and the site they crown. And as to sites, while Durham is made more picturesque by the trees about it and the castle walls beside it, Lincoln's loftier perch and closer union with the town give it the nobler look. But comparisons are futile. Durham stands superbly in front of its city; Lincoln stands superbly above its city; each is unparalleled in its way, and it is hopeless to determine which way is really finer.

Of course with such a cathedral one need

not pick one's point of view; the difficulty would be to find a place above the horizon whence the church of Lincoln could not be well seen. But to my mind there is one point of view from which it is almost better worth seeing than from very near or from very far. This is from the Vicar's Court—a beautiful walled garden sloping down the hill to the southward of the choir. Seen from here in summer, a mass of trees conceals the greater part of the long body; but the tall transept-fronts show clearly, and the roof-lines, and above them the great tower at just the right distance for appreciating its majesty of form and its loveliness of decoration.

Almost all the old ecclesiastical dwellings have disappeared except for frequent fragments built into newer walls. But we scarcely regard their absence, Lincoln the church and Lincoln the secular town have so much else to show us in so many shapes and styles.

M. G. van Rensselaer.

MEMORANDA ON THE CIVIL WAR.

General Lee's Views on Enlisting the Negroes.

[THE subjoined letters, which contain their own explanation, are sent to us through the Hon. W. L. Wilson, M. C., by the Hon. Andrew Hunter, of Charlottesville, West Virginia, who assures us that they have not before appeared in print.—EDITOR.]

RICHMOND, January 7, 1865.

TO GENERAL R. E. LEE.

DEAR GENERAL: I regret that in the succession of stirring events since the commencement of the present war I have had so little opportunity to renew our former, to me at least, exceedingly agreeable acquaintance, and particularly that I have so rarely, if ever, met with a suitable occasion to interchange views with you upon the important public questions which have been and are still pressing on us with such intense interest.

It would have demanded, indeed, in view of the scarcely less than awful weight of care and responsibility Providence and your country have thrown upon you, and which you will pardon me for saying has been grandly met, no ordinarily favorable opportunity to have induced me to intrude upon your over-burdened time and attention for such a purpose; and in approaching you now, in this form, upon a subject which I deem of vital importance, I offer no other apology than the momentous character of the issue fixed upon the hearts and minds of every Southern patriot.

I refer to the great question now stirring the public mind as to the expediency and propriety of bringing to bear against our relentless enemy the element of military strength supposed to be found in our negro population; in other words, and more precisely, the wisdom and sound policy, under existing circumstances, of converting such portions of this popula-

tion as may be required into soldiers, to aid in maintaining our great struggle for independence and national existence.

The subject is one which recent events have forced upon our attention with intense interest, and in my judgment we ought not longer to defer its solution; and although the President in his late annual message has brought it to the attention of Congress, it is manifestly a subject in which the several States of the Confederacy must and ought to act the most prominent part, both in giving the question its proper solution and in carrying out any plans that he may devise on the subject. As a member of the Virginia Senate, having to act upon the subject, I have given it much earnest and anxious reflection, and I do not hesitate to say here, in advance of the full discussion which it will doubtless undergo, that the general objections to the proposition itself, as well as the practical difficulties in the way of carrying it out, have been greatly lessened as I have more thoroughly examined them. But it is not to be disguised that public sentiment is greatly divided on the subject; and besides many real objections, a mountain of prejudice growing out of our ancient modes of regarding the institution of Southern slavery will have to be met and overcome, before we can attain to anything like that degree of unanimity so extremely desirable in this and all else connected with our great struggle. In our former contest for liberty and independence, he who was then at the head of our armies, and who became the Father of his Country, did not hesitate to give his advice on all great subjects involving the success of that contest and the safety and welfare of his country, and in so doing perhaps rendered more essential service than he did in the field; nor do I perceive why, upon such a subject and in such a crisis as the present, we should not have the benefit

of your sound judgment and matured wisdom. Pardon me therefore for asking, to be used not only for my own guidance, but publicly as the occasion may require: Do you think that by a wisely devised plan and judicious selection negro soldiers can be made effective and reliable in maintaining this war in behalf of the Southern States? Do you think that the calling into service of such numbers of this population as the exigency may demand would affect injuriously, to any material extent, the institution of Southern slavery? Would not the introduction of this element of strength into our military operations justify in some degree a more liberal scale of exemptions or details, and by thus relieving from active service in the field a portion of the intelligent and directing labor of the country (as seems to be needed) have a beneficial bearing upon the question of subsistence and other supplies?

Would not, in your judgment, the introduction of such a policy increase, in other regards, our power of defense against the relentless warfare the enemy is now waging against us?

These are but some of the leading inquiries which suggest themselves. But I beg, General, if from a sense of duty and the promptings of your elevated patriotism, overriding unwise and ill-timed delicacy, you consent to reply to these inquiries, for the purpose before frankly indicated, that you will give me your views, as fully as your engagements will allow, upon every other question that may occur to you as likely to conduce to a wise decision of this grave and, as deemed by many, vitally important subject. With highest esteem,

Your obedient servant,

Andrew Hunter.

HEADQUARTERS ARMY NORTH VIRGINIA,
11th January, 1865.

HON. ANDREW HUNTER, RICHMOND, VA.

DEAR SIR: I have received your letter of the 7th inst., and, without confining myself to the order of your interrogatories, will endeavor to answer them by a statement of my views on the subject. I shall be most happy if I can contribute to the solution of a question in which I feel an interest commensurate with my desire for the welfare and happiness of our people. Considering the relation of master and slave, controlled by humane laws and influenced by Christianity and an enlightened public sentiment, as the best that can exist between the white and black races while intermingled as at present in this country, I would deprecate any sudden disturbance of that relation, unless it be necessary to avert a greater calamity to both. I should therefore prefer to rely upon our white population to preserve the ratio between our forces and those of the enemy which experience has shown to be safe. But in view of the preparations of our enemies it is our duty to provide for continued war, and not for a battle or campaign, and I fear that we cannot accomplish this without overtaxing the capacity of our white population. Should the war continue, under existing circumstances, the enemy may in course of time penetrate our country and get access to a large part of our negro population. It is his avowed policy to convert the able-bodied men into soldiers, and to emancipate all.

The success of the Federal arms in the South was followed by a proclamation of President Lincoln for two hundred and eighty thousand men, the effect of

which will be to stimulate the Northern States to procure as substitutes for their own people the negroes thus brought within their reach. Many have already been obtained in Virginia, and should the fortune of war expose more of her territory, the enemy would gain a large accession to his strength.

His progress will thus add to his numbers and at the same time destroy slavery in a manner most pernicious to the welfare of our people. Their negroes will be used to hold them in subjection, leaving the remaining force of the enemy free to extend his conquest. Whatever may be the effect of our employing negro troops, it cannot be as mischievous as this. If it end in subverting slavery, it will be accomplished by ourselves, and we can devise the means of alleviating the evil consequences to both races. I think, therefore, we must decide whether slavery shall be extinguished by our enemies and the slaves be used against us, or use them ourselves at the risk of the effects which may be produced upon our social institutions. I believe that with proper regulations they can be made efficient soldiers. They possess the physical qualifications in an eminent degree. Long habits of obedience and subordination, coupled with the moral influence which in our country the white man possesses over the black, furnish an excellent foundation for that discipline which is the best guarantee of military efficiency. Our chief aim should be to secure their fidelity.

There have been formidable armies composed of men having no interest in the cause for which they fought beyond their pay or hope of plunder. But it is certain that the surest foundation upon which the fidelity of an army can rest, especially in a service which imposes peculiar hardships and privations, is the personal interest of the soldier in the issue of the contest. Such an interest we can give our negroes by giving immediate freedom to all who enlist, and freedom at the end of the war to the families of those who discharge their duties faithfully (whether they survive or not), together with the privilege of residing at the South. To this might be added a bounty for faithful service.

We should not expect slaves to fight for prospective freedom when they can secure it by going to the enemy, in whose service they will incur no greater risk than in ours. The reasons that induce me to recommend the employment of negro troops at all render the effects of the measures I have suggested upon slavery immaterial, and in my opinion the best means of securing the efficiency and fidelity of this auxiliary force would be to accompany the measure with a well-digested plan of gradual and general emancipation. As that will be the result of the continuance of the war, and will certainly occur if the enemy succeed, it seems to me advisable to adopt it at once, and thereby secure all the benefits that will accrue to our cause.

The employment of negro troops under regulations similar in principle to those above indicated would, in my opinion, greatly increase our military strength, and enable us to relieve our white population to some extent. I think we could dispense with our reserve forces except in cases of necessity.

It would disappoint the hopes which our enemies base upon our exhaustion, deprive them in a great measure of the aid they now derive from black troops, and thus throw the burden of the war upon their own

people. In addition to the great political advantages that would result to our cause from the adoption of a system of emancipation, it would exercise a salutary influence upon our whole negro population, by rendering more secure the fidelity of those who become soldiers and diminishing the inducements to the rest to abscond.

I can only say, in conclusion, that whatever measures are to be adopted should be adopted at once. Every day's delay increases the difficulty. Much time will be required to organize and discipline the men, and action may be deferred until it is too late.

Very respectfully, your obedient servant,

R. E. Lee, General.

Some Errors in General Sherman's "Grand Strategy."

IN the February CENTURY is a paper from General Sherman on "The Grand Strategy of the War of the Rebellion." Near the outset of this paper the distinguished author makes a statement as to "the two great antagonist forces" of which the following is the gist:

First. That the belligerent populations, leaving out Maryland, Kentucky, and Missouri, were in round numbers nineteen and nine millions respectively.

Second. That while the entire Federal army averaged (from January, '62-May, '65) from 500,000 to 800,000 "present," the Confederate army averaged about 569,000 men — this last number being determined by taking one-sixteenth of the nine millions which is assumed as the total population of the Confederacy.

Third. That the three States of Maryland, Kentucky, and Missouri furnished to each belligerent a "fair quota," and may be left out of the count.

First. To get a population of nine millions in the Confederate States, General Sherman has included the entire slave population of these States in 1860. By the Census of that year, the 11 Confederate States had in round numbers 5,450,000 whites and 3,650,000 blacks. Now the slave population of these States not only furnished no soldiers to the South,—it supplied much the larger part of the 178,975 colored troops which were enrolled during the war on the side of the North. Nay more — the records of the War Department show that besides some 22,000 white Union troops obtained from scattered points throughout the South, the State of Virginia (West Virginia) furnished 31,872, and that of Tennessee 31,092 men to the Federal army. Hence, in setting down the belligerent populations, not only is it misleading to include the slaves on the Confederate side, but large sections of West Virginia and East Tennessee should be transferred from the Southern to the Northern side. Considering population with reference to the men contributed to the two armies, is it not evident that (omitting Kentucky, Missouri, and Maryland) the two belligerents drew from populations which were in the neighborhood of twenty millions and five millions, instead of nineteen millions and nine millions? It is not intended here to ignore the fact that the slave population of the South was in many ways a source of strength to that section, and that its presence enabled the South to send to the field a larger percentage of white men than could otherwise have

been spared. But it is absurd to estimate, as General Sherman does, that the slaves approached, in the value of their contributions to the struggle, an equal number of white people.

Second. The total number of men furnished to the Federal armies was 2,778,304 (or about 2,300,000 when reduced to a three-year standard); and of these, as General Sherman states, there was an average after January 1, '62 of from 500,000 to 800,000 present in the field. No report of the total number of Confederates enrolled exists, but General Sherman would have us believe that the Confederate Government was able to keep an average of 569,000 men actually in the field. Its limited resources in the way of armament and supplies would have made this impossible—but look at it simply as a question of population. It appears from Phisterer's figures that the average strength of the Federal armies present in the field was about one-fourth of the total number of troops furnished. If the Confederates showed the same proportion between enrolled men and those "present," there must have been over 2,000,000 Confederate troops enrolled during the war out of a total white population of about five millions!

This result might have given the author pause. But while the Confederate records are defective, there was no necessity for such wild statements as General Sherman makes. Many returns of the Confederate armies exist, and from these an approximate estimate of the total Confederate strength can be obtained. There never was a time, for instance, when the Army of Northern Virginia numbered 100,000 men present. It rarely even approached it; and yet this army generally exceeded in strength the main western Confederate army. It is doubtful whether there was at any date, throughout the Confederacy, more than half the men "present" that General Sherman assumes as the average strength of the Southern armies, and it is very certain that their real average strength was less than half of the numbers he gives. The total number of Confederates enrolled during the war was probably between 600,000 and 700,000 men. The former estimate was given by a Northern writer upon a careful examination of the records twenty years ago, and the best estimates at the War Records office to-day do not vary greatly from that number.

Third. It is certain that Kentucky, Missouri, and Maryland furnished far more troops to the Northern than to the Southern side, which, considering the fact that these States were occupied almost entirely by Union troops, is not surprising. Phisterer credits

Massachusetts	with	46,638	Union troops.
Missouri	"	109,111	"
Kentucky	"	75,760	"

If General Sherman means by "fair quota" that these States contributed forces to the two armies in the same proportion as that existing between the total Northern and Southern armies, he may be near the truth. But if he means, as seems probable, that they contributed equal or nearly equal numbers to the two sides, he is as wide of the mark as he is in the points above noted.

W. Allan.

McDONOUGH, MARYLAND, April 14, 1888.

SIDEREAL ASTRONOMY: OLD AND NEW.*

I. THE DATA IT HAS COLLECTED.

WHEN did astronomy have its beginnings on the earth? There have been many learned attempts to answer this question. They all have led to the conclusion that long before the historic period there was a large common stock of knowledge; so large, in fact, that one distinguished writer finds it simplest to ascribe the origin of astronomy to the teaching of an extinct race: "Ce peuple ancien qui nous à tout appris — excepté son nom et son existence," his commentator adds.

Astronomy is older than the first records of any nation. In order that the records might exist, it was first necessary to divide the years and times by astronomical observations. On the other hand, I believe the travelers of to-day have found no tribe so degraded as to be without some knowledge of the sort.

It is extremely doubtful if animals notice special celestial bodies. Birds seem to be inspired by the approach of day and not by the actual presence of the sun. It is a question whether dogs "bay the moon" or only the moon's light. A friend maintains that her King Charles spaniel watched the progress of an occultation of Venus by the crescent moon with the most vivid interest. This is the only case which I have been able to collect in which the attention of animals has been even supposed to have been held by a celestial phenomenon. The actions of the most ignorant savages during a total solar eclipse, compared with those of animals, throw much light on the question of whereabouts in the scale of intelligence the attention begins to be directed to extra-terrestrial occurrences. The savages are appalled by the disappearance of the sun itself, while animals seem to be concerned with the advent of darkness simply.

I am told that the Eskimos of Smith's Sound have *names* for a score or more of stars, and that their long sledge-journeys are safely made by the guidance of these stars alone. I have myself seen a Polynesian islander embark in a canoe, without compass or chart, bound for an island three days' sail distant. His course

would need to be so accurately laid that at the end of his three days he should find himself within four or five miles of his haven; if he passed the low coral island at a greater distance, it could not be seen from his frail craft. There can be little doubt but that he used the sun by day and the stars by night to hold his course direct.

There must have been centuries during which such knowledge was passed from man to man by word of mouth, woven into tales and learned as a part of the lore of the sailor, the hunter, or the tiller of the soil. No one can say how early this knowledge of the sky was put into the formal shape of maps, globes, or catalogues. Eudoxus is said to have constructed a celestial globe B. C. 366. Globes would naturally precede maps, and maps mere lists or catalogues.

The prototype of all sidereal catalogues is the *Almagest* of Ptolemy (A. D. 150), which includes not only the observations of Ptolemy, but those of the great Hipparchus (B. C. 127). It contains the description of 1022 stars, their positions, and their brightness. Here we meet for the first time the name *magnitude* of a star. Ptolemy divides all the stars into magnitudes — degrees of brightness. Sirius, Capella, are of the first magnitude; the faintest stars visible to the eye are of the sixth. But Ptolemy has gone further, and divides each magnitude into three parts. The moderns divide each class into ten parts, that is, decimally.

SCALE OF MAGNITUDES.

IN assigning magnitudes in this way, we have unconsciously adopted a scale. A star of the third magnitude is brighter than one of the fourth. How much brighter? Sirius and the brightest stars are about one hundred times more brilliant than the very faintest stars which can be seen with the naked eye. In general a star of any magnitude, as fifth, is four-tenths as bright as the star of the next brighter magnitude, as fourth. Ten fifth-magnitude stars taken together are as bright as four fourth-magnitude stars, and so on. This relation between the brightness of stars of consecutive magnitudes gives us a means of computing the total amount of light received from stars. For example, there are ten stars in our sky as bright as the brilliant star Vega, or Alpha Lyrae, which we see in our zenith during the summer months. The collective light of these ten first-magnitude

* This article contains only a reference to the important advances in sidereal astronomy which have been made by the aid of photography during the past two years.

stars is ten times that of Vega. The 37 second-magnitude stars are together 7.4 times as bright as Vega; the 128 third-magnitude stars are 10.2 times as bright; and so on down to the 4328 sixth-magnitude stars, which, taken together, are 22.1 times as bright. Taking all the stars visible to us without a telescope and adding their brilliancy, we find that all the naked-eye stars give us a light 67.6 times as bright as that from Vega. Now the stars of the seventh and eighth magnitudes have been counted; there are 13,593 of the seventh, 57,960 of the eighth, and they too send light to us, although they are individually invisible. All the seventh-magnitude stars taken together give us 27.8 times as much light as Vega, and the eighth give us 47.4 as much; so that we have from both of these classes 75.2 times the light of Vega; that is, actually more light comes to us from stars so faint as to be individually invisible than from the less numerous and brighter stars that we see with the naked eye. We may recollect that more than half of the light of a star-lit night comes from the collective luster of stars, each of which is totally invisible except in the telescope.

METHODS OF NAMING THE STARS.

IN Ptolemy's *Almagest*, and for fifteen centuries later, there were two and but two ways of designating a particular star. Some few of the brighter stars had special names.

By far the greater number were described by their situation in their constellation. The brightest star in Taurus was the eye of the Bull, and so for others, as the belt and sword of Orion. This was all very well for the brighter stars, and it did not require that the boundaries of the constellations should be very accurately fixed. There was no mistaking Regulus, Cor Leonis—the heart of the lion. But when we come to the small pairs of stars which make the paws of the Great Bear, or to some of the stars in the windings of Serpens, then it is evident that Ptolemy must have had accurately bounded constellations laid down on charts or globes. Not a single ancient globe or chart has come down to us. The oldest extant are but Arabian copies of the tenth century.

Where, then, do we derive our figures of the constellations? If any one of my readers will ask some astronomical friend to show him a copy of Flamsteed's *Atlas Coelestis* he will see the beautiful and spirited drawings of the constellation figures, and be charmed and delighted with their vigor and character. Who could have drawn these outlines, instinct with life? Who of the ancients knew the whole character of the timid hare, or who could draw Andromeda, and put a modern resignation in

her chained despair? These figures were drawn by a master indeed, for they are from the hand of Albert Dürer himself. If we follow the history of how he came to make them for an edition of Ptolemy, and think of him patiently fitting his marvelously free outlines to match the stars in the sky and the crabbed descriptions in Ptolemy's book, the pleasure does not diminish. About 1603 Bayer introduced the practice of designating the brighter stars of each constellation by the letters of the Greek alphabet, so that Cor Leonis or Regulus became α Leonis; Aldebaran became α Tauri, and so on. As the number of the well-determined stars has vastly increased, the practice of referring to them by their numbers in some well-known catalogue has come into vogue; so that α Leonis, for example, might be known as Bradley, 1406, from its number in Bradley's catalogue; or as Lalande, 19,755, and so on. It is not to be denied that astronomical nomenclature in this direction could be greatly improved.

URANOMETRIES.

THE word *Uranometry* has received a limited technical meaning in astronomy. It is used to denote a description of the fixed stars which are visible to the naked eye only. The description of each star places it in its proper constellation, assigns its latitude and longitude, and gives its brightness or magnitude. Variable stars, which change their brightness periodically,—and there are many such,—are treated separately.

Ptolemy's *Almagest* (1022 stars) was an incomplete uranometry, since there were more than 3000 stars visible to him. Al-Sûfi's revision of it, in the tenth century, added no stars, but simply revised the magnitudes given by Ptolemy. Bayer (1603) gave 1200 stars. None of the very important works of Flamsteed (1753), Harris (1725), Wollaston (1811), Harding (1822), were complete. That is, no one gave every star down to a certain brightness. It was reserved for Argelander (1843) to give in the *Uranometria Nova* the position of brightness of every star visible to the naked eye at Bonn. This was a picture of the sky; changes could no longer occur without detection. This work gave the places of 3256 stars, from first to sixth magnitudes, and very careful eye-estimates of their magnitudes. Argelander's work has been repeated by Heis (1872). The southern sky has been treated in the same way by Dr. Gould, in the *Uranometria Argentina* (1879), containing 6694 southern and 991 northern stars, of magnitudes between the first and seventh. Houzeau, during a residence in Jamaica, made a uranometry which embraces every star in

both hemispheres, and which has a special value owing to the fact that the estimates of magnitude were all made by a single person.

We have, then, a complete picture of our sky, as seen with the naked eye, based on eye-estimates of the brightness of the stars. It should be said that the magnitudes so determined are extremely accurate, approaching closely to the exactness which can be reached with the best photometers, or instruments for measuring the relative brightness of stars.

THE HARVARD PHOTOMETRY.

UP to 1877, when Professor Pickering became director of the Harvard University Observatory, there was no single observatory devoted to photometry as a chief end. The important works of this nature had been done as a part of other duties. Professor Pickering turned the whole strength of the observatory in this direction, and by means of new methods and new instruments he and his assistants have just completed a work of the first importance—the *Harvard Photometry*. It contains the positions and the measured brightness of 4260 stars visible at Cambridge, together with a comparison with the magnitudes of all other observers. The actual number of single observations is 95,000. Each one of these consists in a direct photometric comparison of the relative brightness of a star with one of the polar stars. The polar stars are always visible; the stars to be measured were taken as they crossed the meridian; and these direct measures, suitably combined, give the relative brightness of each of the stars of the list. We have now a sure basis for all future work, and a perfect picture of the sky at this time.

THE NUMBER OF THE STARS.

THE total number of stars one can see will depend very largely upon the clearness of the atmosphere and the keenness of the eye. There are in the whole celestial sphere about 6000 stars visible to an ordinarily good eye. Of these, however, we can never see more than a fraction at any one time, because a half of the sphere is always below the horizon. If we could see a star in the horizon as easily as in the zenith, a half of the whole number, or 3000, would be visible on any clear night. But stars near the horizon are seen through so great a thickness of atmosphere as greatly to obscure their light, and only the brightest ones can there be seen. As a result of this obscuration, it is not likely that more than 2000 stars can ever be taken in at a single view by any ordinary eye. About 2000 other stars are

so near the South Pole that they never rise in our latitudes. Hence, out of 6000 supposed to be visible, only 4000 ever come within the range of our vision, unless we make a journey towards the equator.

As telescopic power is increased, we still find stars of fainter and fainter light. But the number cannot go on increasing forever in the same ratio as with the brighter magnitudes, because, if it did, the whole sky would be a blaze of starlight. If telescopes with powers far exceeding our present ones were made, they would no doubt show new stars of the twentieth and twenty-first, etc., magnitudes. But it is highly probable that the number of such successive orders of stars would not increase in the same ratio as is observed in the eighth, ninth, and tenth magnitudes, for example. The enormous labor of estimating the number of stars of such classes will long prevent the accumulation of statistics on this question; but this much is certain, that in special regions of the sky, which have been searchingly examined by various telescopes of successively increasing apertures, the number of new stars found is by no means in proportion to the increased instrumental power. If this is found to be true elsewhere, the conclusion may be that, after all, the stellar system can be experimentally shown to be of finite extent and to contain only a finite number of stars. In the whole sky an eye of average power will see about 6000 stars, as I have just said. With a telescope this number is greatly increased, and the most powerful telescopes of modern times will show more than 60,000,000 stars. Of this number, not one out of one hundred has ever been catalogued at all.

In Argelander's *Durchmusterung* of the stars of the northern heavens, there are recorded as belonging to the northern hemisphere:

10 stars between the 1.0 magnitude and the 1.9 magnitude.

In all 314,926 stars, from the first to the 9½ magnitudes, are contained in the northern sky; or about 600,000 in both hemispheres. All of these can be seen with a 3-inch object-glass.

THE CHARTS OF THE BERLIN ACADEMY.

IN 1824 Bessel wrote to the Academy of Berlin somewhat as follows:

It is of the highest astronomical interest that every fixed star in the sky should be known, and its position fixed. Completeness in this task is unattainable; but when we once have maps of all the stars down to a

certain magnitude, then the object will be attained. The limit I set is at those stars which can just be plainly seen in one of Fraunhofer's excellent comet-seekers; * that is, at about the ninth or tenth magnitude.

Bessel then gives briefly the reasons why such a complete list would be valuable, in addition to its importance as a finished picture of the sky so far as it went; and continues:

For all these reasons I have often expressed my hope that we might have such a complete list, if even over only a portion of the sky; and I think the time of an astronomer, and of an observatory, could not be better spent than in aiding a systematic attempt to carry out this plan. I myself designed the instruments of the Koenigsberg Observatory for such a purpose, and since 1821 I have observed as many as possible of the stars from 15° north to 15° south of the equator. In all there are 36,000 observations of 32,000 stars. If the stars are equally numerous over the whole sky, there are 125,000 such. I am about to carry on these zones up to 45° from the equator.

With this introduction Bessel unfolds his plan, which was to have 24 astronomers join in an undertaking to make the 24 separate charts required to extend round the whole 24 hours, and in width over the 30° from 15° north to 15° south of the equator. He himself made a small chart as a beginning, "to break the path," and as a model. The Academy welcomed Bessel's plan, and the work began in 1825.

The first two charts were received in 1828, and the work on the others continued slowly. One of these charts has a great history. It had been engraved but not yet distributed, and was lying in the Berlin Observatory for examination. On the evening of September 23, 1846, Le Verrier's letter, giving the place of a new planet, Neptune, was received in Berlin. The planet had never been seen, but its existence had been predicted from the otherwise inexplicable motions of Uranus. The predicted place of the planet fell within the limit of the lately finished chart, which was taken to the telescope. In very truth there was an eighth-magnitude star in the sky which was not on the chart. This star was in motion; it had the planetary light and disc; it was, in fact, Neptune. The proposal of Bessel had borne splendid fruit. Besides this major planet, many of the minor planets (asteroids) were discovered by these maps. Finally, in 1859, thirty-five years after Bessel's letter, this series was finished. But before it was finished a greater undertaking was begun, of which we must give a short account. One thing must be continually kept in sight. Every one of the systematic *Durchmusterungen*, as the Germans say,—we have no word for them,—is the direct outcome of Bessel's original proposition.

ARGELANDER'S "DURCHMUSTERUNG."

ARGELANDER was Bessel's pupil. In the great zones of Koenigsberg, Bessel had pointed the telescope on the stars as they passed, and Argelander read the verniers which showed their position. Finally Argelander had an observatory of his own at Bonn, and his two young assistants, Drs. Krueger and Schoenfeld, were all to him that he had been to Bessel. The years 1852 to 1862 were spent in the tremendous task of observing every star plainly visible in such a comet-seeker as we have described, over more than half of the whole heavens. The telescope was pointed and fixed in position. The time of the passage of every star over a wire in the field of view was noted; the part of the wire crossed by the star was also noted, and finally the brightness of the star.

The circle shows the field of view of the telescope. Half of it is covered with a thin plate of glass with a scale painted on it: *a*, *b*, *c*, *d* are stars moving in the direction of the arrow. The telescope itself is fixed. As each one comes to the edge, A B, the time is noted to the nearest half of a second. The division of the scale is also noted where each star touches it (+ 4, for *a*, - 5, for *d*). Finally the brightness in magnitudes is recorded (*a*, 8th mag.; *d*, 9.3 mag.). The observer at the telescope records the magnitude and the scale. The time is called out by him and noted by an assistant on a chronometer.

Not counting the time for the computations, the observations alone lasted seven years and one month. 1797 hours were spent in observing the comet-seeker zones, on 625 nights; and 227 other nights were used in part or wholly in revision zones to correct errors of one nature or another, or to solve doubts.

* A telescope with about 3 inches aperture, magnifying 10 times.

In the comet-seeker zones 850,000 single observations were made, or on the average 473 stars per hour, or 8 per minute. In specially rich parts of the Milky Way more than 16 stars per minute were often observed, and the richest zone had 1226 stars in the hour, or $20\frac{1}{2}$ per minute—one every 3 seconds. Counting all the observations together they were no less than 1,065,000, and this million of observations gave the positions and the brightness of 324,198 stars—that is, the position and brightness of every star plainly visible in the telescope used, from the North Pole down to 2° south of the equator.

The very enumeration of the observations makes one fatigued. Only the astronomer can know the multifarious nature of the calculations connected with the observations themselves. Millions on millions of figures had to be made, and made correctly; and, finally, every star had to be engraved on charts, and engraved correctly both as to position and magnitude.

How this work could have been finished in ten years, one does not see. That Argelander and his two assistants had the courage to persevere in this tremendous task is itself a marvel. But the work is done, is printed, and is in daily use by scores of astronomers. Its value will never be less. It will remain forever as a picture of the sky, available for every purpose.

Mr. Proctor has done a very useful work in representing the results of Argelander's *Durchmusterung* in a single chart, which is here reproduced. For every star in Argelander's catalogue Mr. Proctor has laid down a dot, correct as to position and magnitude—324,198 dots in all. The resulting map is here photographed down so that the individual dots are, in general, hard to distinguish, but the law of aggregation of the stars is all the better brought out. The map is most interesting, not only in relation to the mere positions and brilliancy of the stars, but as showing, better than any other means can, the apparently capricious manner in which the stars are spread over the surface of the sky. Some evidences of law can be made out, and, in the original, the great features of the

Milky Way come forth in a most striking manner. It must be remembered that this map contains, besides the stars visible to the naked eye, all those visible in an ordinary three-inch telescope.

SCHOENFELD'S "DURCHMUSTERUNG."

ARGELANDER'S original plan was to extend his observations to 23° south of the equator. Professor Schoenfeld, his successor at Bonn, and his aid in the original undertaking, in 1885 completed the plan projected by Bessel in 1824, and so nobly followed at Bonn from 1852 to 1860. From 1876 to 1884 he has catalogued the stars from 2° to 23° south of the equator, and the work is just finished. Soon we shall have this new *Durchmusterung*, with its charts, showing the position and brightness of 133,658 southern stars.

It is most desirable that this enumeration should be extended over the whole southern sky. So long ago as 1866 the work was begun in the Southern Hemisphere, but apparently it was abandoned, though there is reason to believe that the observatory of the Argentine Republic at Cordoba may begin anew. Professor Stone, at Cincinnati, has partly completed the zone between 23° and 31° (south).

A recognition of the enormous advantages which photography would have over ordinary visual methods of charting is now leading several observatories to attempt the cataloguing of stars from photographic negatives.

The difficulties are many, but success seems to be tolerably certain, and the observatories of Harvard University and of Paris have already produced wonderful results in this direction. The observatory of the Cape of Good Hope, also, has seriously begun a southern *Durchmusterung* by photographic methods.

SYSTEMATIC OBSERVATORIES OF THE STARS IN ZONES.

THESE *Durchmusterungen* are most important. They give us an index to the stars of the whole sky. But it is clear that

OF THE NORTHERN HEMISPHERE.

the positions of the separate stars cannot be accurate when so many as eight or ten per minute are observed. What the astronomer wants is the *accurate* position of a star—its latitude and longitude, as it were. We shall see how much pains is necessary to fix the position of a single star with real precision. Scores of observations are needed, and each observation requires at least five minutes to make and an hour to calculate. When we say that many thousand stars have their positions known with this high precision, we shall be giving a feeble idea of the amount of labor devoted to this question.

But it is impossible to fix the position of every one of the 600,000 stars of the *Durchmusterungen* with this last degree of precision, and yet it is important to know very closely the place of each star. The positions of all faint comets, of asteroids, etc., are known by referring them to neighboring stars. We must know the positions of these stars. These positions are determined by a special kind of observations—zone observations, so called. A telescope is fixed in the meridian so that it can only move north and south. A divided circle is attached to this, the indications of which give the altitude of the stars seen in the field. One observer at the telescope moves it slowly up and down until some star enters the field. The motion is stopped. The transit of the star is observed over spider lines stretched in the field, while a second observer reads the altitude of this star from the divided circle. In this way it is possible to obtain very accurate positions, and by confining the work to a narrow zone the observations are increased as to number, and the subsequent computations are much simplified.

Before the days of the Berlin charts, or of the *Durchmusterung*, Lalande in Paris (1790) had fixed the places of more than 50,000 stars in this way, and the Abbé Lacaille (1751) had made a special expedition to the Cape of Good Hope to determine the places of 9766 southern stars. Bessel took up the same research in the years 1821–33, and his results are given in two magnificent catalogues, which include 62,000 of the most important stars from 15° south to 45° north of the equator. He made 75,011 single observations, employing 868 hours in observing alone. That is, about 84 stars per hour were observed. Argelander read the altitudes of the stars from the circle while Bessel observed their transits. One of Argelander's first works, when he took charge of the observatory at Bonn, was to continue this series of zones from 45° up to 80° north of the equator—that is, to within 10° of the Pole. In this region he made 26,424 observations of 22,000 stars, or 83 stars per hour.

Not content with this extension of Bessel's zones to the north, Argelander next began a series of southern zones from 15° to 31° south of the equator. This task he also completed, with 23,250 observations of 17,600 stars, or 83 stars per hour.

Bessel and Argelander alone had pushed their zones from 31° south to 80° north of the equator, making nearly 125,000 separate observations and fixing the positions of 101,600 stars. We have no space to speak of the 38,000 observations made at the Naval Observatory in Washington in the years 1846–49, or of the zones observed by Lieutenant Gilliss, of our navy, in Chili (1850), which covered the region for 25° round the South Pole (27,000 stars). It is most unfortunate for the credit of American astronomers, as well as for the good of the science, that these collections are not yet suitably published.

One would think that the 100,000 stars of Bessel and Argelander would have been sufficient for the needs of astronomy. But the German Astronomical Society, at its meeting in Bonn in 1867, deliberately resolved upon the task of accurately determining the position of *every* star as bright as the ninth magnitude contained in Argelander's *Durchmusterung*.

The veteran Argelander presided at this meeting, and it is curious to note how serious the undertaking appeared to be to him. No one knew better how gigantic a task it was. The plan was well laid. A set of 539 very well determined stars was assumed as fundamental, and the society resolved that the position of the stars to be determined should be referred to these. The sky was cut up into zones five degrees wide, and various observatories undertook to finish one or more of these zones. The Polar Zone (90° to 80° north of the equator) had lately been completed by Carrington, in England, and did not need revision.

The observatories of Kazan (80° – 75°), Dorpat (75° – 70°), Christiania (70° – 65°), Helsingfors (65° – 55°), Harvard University (55° – 50°), Bonn (50° – 40°), Lund (40° – 35°), Leyden (35° – 30°), Cambridge, England (30° – 25°), Berlin (25° – 15°), Leipzig (15° – 5°), Albany (5° – 1°), Nikolaief (1° to 2° south), joined in the work, and to-day it is nearly completed.

But this is only a beginning. Schoenfeld's *Durchmusterung* to 23° south will soon be printed, and it is the intention of the German Astronomical Society to push the zones to this point, to join on to the great series of southern zones printed by our countryman Dr. B. A. Gould, at the National Observatory of the Argentine Republic. Dr. Gould is himself a pupil of Argelander, and his magnificent work may be fairly called an outcome of the

spirit of Bessel, the master. 105,000 observations of some 73,000 stars, from 23° south to 65° south of the equator, have been printed by Dr. Gould as part of the results of fourteen years' labor in a foreign country. Thus from the North to the South poles the labors of Carrington, Argelander, Bessel, Gould, and Gilliss * have given us an almost complete catalogue of accurate positions of nearly all the principal stars. Besides this we shall shortly have the region from 80° north to 2° south completely re-observed, and by 1900 the region to 23° south will be done also.

SPECIAL CATALOGUES OF STARS.

BESIDES these gigantic undertakings there have been scores of separate catalogues pretending to greater precision even, the very names of which we cannot mention. The observatories of Greenwich, Oxford, Edinburgh, Paris, Poltava, Dorpat, Bonn, Berlin, Palermo, Washington, Harvard University, Melbourne, Cape of Good Hope, and many others have issued such accurate collections.

It is also necessary to say that a certain small number of stars—several thousands—have had their positions and motions determined with extreme precision; and of these again, a few hundreds of the brightest stars have been observed for so long, and for so many times, that their resulting positions are now almost as accurate as they can be made, and their motions so well known as to admit of very little improvement by the work of the next generation. These are our fundamental stars, so called.

Such, then, are our data: a few hundred stars determined with the last degree of precision, a few thousand nearly as well, two hundred thousand with considerable accuracy, and nearly a half a million separate stars known by the approximate positions of the *Durchmusterungen*, or additional to these from

* Two Germans, one Englishman, two Americans.

the southern zones. We can add to these too the two hundred thousand or more stars laid down in the ecliptic charts of Paris, Vienna, and Clinton (New York), which serve as nets to catch the minor planets just now, but which have an incalculable value as accurate pictures of the sky at a given instant.

The brightness of some 10,000 stars is very accurately known, and that of nearly half a million has been very approximately fixed. Lastly, the distances of some fifteen of the brighter stars from the earth are known with tolerable certainty, and that of a few more with a good degree of approximation.

These are the materials available—mighty monuments to human ingenuity, skill, patience, devotion. But what further problems will they solve for us? What far-reaching conclusions can be drawn? In a succeeding article I will try to show to what results a combination of the data so painfully accumulated may lead, and what conclusions may safely be drawn even now.

The science of the positions and the motions of the stars is not so young as that other science so well described by Professor Langley in his admirable articles on "The New Astronomy" (*THE CENTURY* for September, October, December, 1884, and March, 1885), but it has its modern period as well as the historical one which has been here set forth. The old astronomy has set itself to solve such problems as these: What is the rate at which the whole solar system is moving on through space? What are the distances and what are the masses of the stars? What is the shape of the stellar cluster to which our sun belongs? Are the stars in general broken up into subordinate universes? or do they, as a whole, form one mighty system, with one common motion?

Some of these and other such questions are answered; some seem almost unanswerable; some are still in the way of solution.

Edward S. Holden.

STILL DAYS AND STORMY.

YESTERDAY the wind blew
Down the garden walks:
Marigolds, the day through,
Trembled on their stalks.

But to-day the wind's dead,
Marigolds are still:
Miss they what the wind said,
Do they take it ill?

Yesterday my love stood
Harkening to me;
Fair flower of womanhood,
All a-tremble she.

But to-day she's sad, still,
Makes no true-love sign:
Is her lover to her will,
Is she yet mine?

Richard E. Burton.

THE HEART OF THE SOUTHERN CATSKILLS.

N looking at the southern and more distant Catskills from the Hudson River on the east, or on looking at them from the west, from some point of vantage in Delaware County, you see, amidst the group of mount-

ains, one that looks like the back and shoulders of a gigantic horse. The horse has his head down grazing; the shoulders are high, and the descent from them down his neck very steep; if he were to lift up his head, one sees that it would be carried far above all other peaks, and that the noble beast might gaze straight to his peers in the Adirondacks or the White Mountains. But the head and neck never come up: some spell or enchantment keeps them down there amidst the mighty herd; and the high, round shoulders and the smooth, strong back of the steed are alone visible. The peak to which I refer is Slide Mountain, the highest of the Catskills by some two hundred feet, and probably the most inaccessible; certainly the hardest to get a view of, it is hedged about so completely by other peaks. The greatest mountain of them all, and apparently the least willing to be seen, only at a distance of thirty or forty miles is it seen to stand up above all other peaks. It takes its name from a landslide which occurred many years ago down its steep northern side, or down the neck of the grazing steed. The mane of spruce and balsam fir was stripped away for many hundred feet, leaving a long gray streak visible from afar.

Slide Mountain is the center and the chief of the southern Catskills. Streams flow from its base and from the base of its subordinates to all points of the compass: the Rondout and the Neversink to the south; the Beaverkill to the west; the Esopus, or Big Injin, to the north; and several lesser streams to the east. With its summit as the center, a radius of ten miles would include within the circle described but very little cultivated land; only a few poor, wild farms here and there in the numerous valleys. The soil is poor, a mixture of gravel and clay, and subject to slides. It lies in the valleys in ridges and small hillocks as if dumped there from a huge cart. The tops of the southern Catskills are all capped with a kind of conglomerate or pudding-stone, a rock of cemented quartz pebbles which underlies the coal measures. This rock disintegrates under

the action of the elements, and the sand and gravel which result are carried into the valleys and make up most of the soil. From the northern Catskills, so far as I know them, this rock has been swept clean. Low down in the valleys the old red sandstone crops out, and as you go west into Delaware County, in many places it alone remains and makes up most of the soil, all the superincumbent rock having been carried away.

Slide Mountain had been a summons and a challenge to me for many years. I had fished every stream that it nourished, and had camped in the wilderness on all sides of it, and whenever I had caught a glimpse of its summit I had promised myself to set foot there before another season had passed. But the seasons came and went, and my feet got no nimbler and Slide Mountain no lower, until finally, one July, seconded by an energetic friend, we thought to bring Slide to terms by approaching him through the mountains on the east. With a farmer's son for guide we struck in by way of Weaver Hollow, and, after a long and desperate climb, contented ourselves with the Wittenburg, instead of Slide. The view from the Wittenburg is in many respects more striking, as you are perched immediately above a broader and more distant sweep of country, and are only about two hundred feet lower. You are here on the eastern brink of the southern Catskills, and the earth falls away at your feet and curves down through an immense stretch of forest till it joins the plain of Shokan, and thence sweeps away to the Hudson and beyond. Slide is south-west of you, six or seven miles distant, but is visible only when you climb into a tree-top. I climbed and saluted him, and promised to call next time.

We passed the night on the Wittenburg, sleeping on the moss, between two decayed logs, with balsam boughs thrust into the ground and meeting and forming a canopy over us. In coming off the mountain in the morning we ran upon a huge porcupine, and I learned for the first time that the tail of a porcupine goes with a spring like a trap. It seems to be a set-lock, and you no sooner touch with the weight of a hair one of the quills than the tail leaps up in the most surprising manner, and the laugh is not on your side. The beast cantered along the path in my front, and I threw myself upon him, shielded by my roll of blankets. He submitted

quietly to the indignity, and lay very still under my blankets, with his broad tail pressed close to the ground. This I proceeded to investigate, but had not fairly made a beginning when it went off like a trap, and my hand and wrist were full of quills. This caused me to let up on the creature, when it lumbered away till it tumbled down a precipice. The quills were quickly removed from my hand, and we gave chase. When we came up to him he had wedged himself in between the rocks so that he presented only a back bristling with quills, with the tail lying in ambush below. He had chosen his position well, and seemed to defy us. After amusing ourselves by repeatedly springing his tail and receiving the quills in a rotten stick, we made a slip-noose out of a spruce root, and after much manœuvring got it over his head and led him forth. In what a peevish, injured tone the creature did complain of our unfair tactics! He protested and protested, and whimpered and scolded like some infirm old man tormented by boys. His game after we led him forth was to keep himself as much as possible in the shape of a ball, but with two sticks and the cord we finally threw him over on his back and exposed his quillless and vulnerable under side, when he fairly surrendered and seemed to say, "Now you may do with me as you like." His great chisel-like teeth, which are quite as formidable as those of the woodchuck, he does not appear to use at all in his defense, but relies entirely upon his quills, and when those fail him he is done for.

After amusing ourselves with him a while longer, we released him and went on our way. The trail to which we had committed ourselves led us down into Woodland Valley, a retreat which so took my eye by its fine trout brook, its superb mountain scenery, and its sweet seclusion, that I marked it for my own, and promised myself a return to it at no distant day. This promise I kept, and pitched my tent there twice during that season. Both occasions were a sort of laying siege to Slide, but we only skirmished with him at a distance; the actual assault was not undertaken. But the following year, reënforced by two other brave climbers, we determined upon the assault, and upon making it from this, the most difficult, side. The regular way is by Big Injin Valley, where the climb is comparatively easy, and where it is often made by ladies. But from Woodland Valley only men may essay the ascent. Larkins is the upper inhabitant, and from our camping-ground near his clearing we set out early one June morning.

One would think that nothing could be easier

to find than a big mountain, especially when one is encamped upon a stream which he knows springs out of its very loins. But, for some reason or other, we had got an idea that Slide Mountain was a very slippery customer and must be approached cautiously. We had tried from several points in the valley to get a view of it, but were not quite sure we had seen its very head. When on the Wittenburg, a neighboring peak, the year before, I had caught a brief glimpse of it only by climbing a dead tree and craning up for a moment from its topmost branch. It would seem as if the mountain had taken every precaution to shut itself off from a near view. It was a shy mountain and we were about to stalk it through six or seven miles of primitive woods, and we seemed to have some unreasonable fear that it might elude us. We had been told of parties who had essayed the ascent from this side, and had returned baffled and bewildered. In a tangle of primitive woods, the very bigness of the mountain baffles one. It is all mountain; whichever way you turn—and one turns sometimes in such cases before he knows it—the foot finds a steep and rugged ascent.

The eye is of little service; one must be sure of his bearings and push boldly on and up. One is not unlike a flea upon a great shaggy beast, looking for the animal's head, or even like a much smaller and much less nimble creature: he may waste his time and steps, and think he has reached the head when he is only upon the rump. Hence I closely questioned our host, who had several times made the ascent. Larkins laid his old felt hat upon the table, and, placing one hand upon one side and the other hand upon the other side, said: "There Slide lies, between the two forks of the stream, just as my hat lies between my two hands. David will go with you to the forks, and then you will push right on up." But Larkins was not right, though he had traversed all those mountains many times over. The peak we were about to set out for did not lie between the forks, but exactly at the head of one of them; the beginnings of the stream are in the very path of the Slide, as we afterward found. We broke camp early in the morning, and, with our blankets strapped to our backs and rations in our pockets for two days, set out along an ancient, and in places obliterated, bark road that followed and crossed and re-crossed the stream. The morning was bright and warm, but the wind was fitful and petulant, and I predicted rain. What a forest solitude our obstructed and dilapidated wood road led us through!—five miles of primitive woods before we came to the forks, three miles before we came to the

"burnt shanty" (a name merely — no shanty there now for twenty-five years past). The ravages of the bark peelers were still visible, now in a space thickly strewn with the soft and decayed trunks of hemlock-trees and overgrown with wild cherry, then in huge mossy logs scattered through the beech and maple woods: some of these logs were so soft and mossy that one could sit or recline upon them as upon a sofa.

But the prettiest thing was the stream soliloquizing in such musical tones there amidst the moss-covered rocks and boulders. How clean it looked, what purity! Civilization corrupts the streams as it corrupts the Indian. Only in such remote woods can you now see a brook in all its original freshness and beauty. Only the sea and the mountain forest brook are pure; all between is contaminated more or less by the work of man. An ideal trout brook was this, now hurrying, now loitering, now deepening around a great boulder, now gliding evenly over a pavement of green-gray stone and pebbles; no sediment or stain of any kind, but white and sparkling as snow water, and nearly as cool. Indeed, the water of all this Catskill region is the best in the world. For the first few days one feels as if he could almost live on the water alone; he cannot drink enough of it. In this particular it is indeed the good Bible land, "a land of brooks of water, of fountains and depths that spring out of valleys and hills."

Near the forks we caught, or thought we caught, through an opening, a glimpse of Slide. Was it Slide? Was it the head, or the rump, or the shoulder of the shaggy monster we were in quest of? At the forks there was a bewildering maze of underbrush and great trees, and the way did not seem at all certain; nor was David, who was then at the end of his reckoning, able to reassure us. But in assaulting a mountain, as in assaulting a fort, boldness is the watch-word. We pressed forward, following a line of blazed trees for nearly a mile; then turning to the left, we began the ascent of the mountain. It was steep, hard climbing. We saw numerous marks of both bears and deer; but no birds, save at long intervals the winter wren flitting here and there and darting under logs and rubbish like a mouse. Occasionally its gushing lyrical song would break the silence. After we had climbed an hour or two, the clouds began to gather, and presently the rain began to come down. This was discouraging; but we put our backs up against trees and rocks, and waited for the shower to pass.

"They are wet with the showers of the mountain and embrace the rock for want of a shelter," as they did in Job's time. But the

shower was light and brief, and we were soon under way again. Three hours from the forks brought us out on the broad level back of the mountain upon which Slide, considered as an isolated peak, is reared. After a time we entered a dense growth of spruce, which covered a slight depression in the table of the mountain. The moss was deep, the ground spongy, the light dim, the air hushed. The transition from the open, leafy woods to this dim, silent, weird grove was very marked. It was like the passage from the street into the temple. Here we paused awhile and ate our lunch, and refreshed ourselves with water gathered from a little well sunk in the moss.

The quiet and repose of this spruce grove proved to be the calm that goes before the storm. As we passed out of it we came plump upon the almost perpendicular battlements of Slide. The mountain rose like a huge rock-bound fortress from this plain-like expanse. It was ledge upon ledge, precipice upon precipice, up which and over which we made our way slowly and with great labor, now pulling ourselves up by our hands, then cautiously finding niches for our feet and zigzagging right and left from shelf to shelf. This northern side of the mountain was thickly covered with moss and lichens, like the north side of a tree. This made it soft to the foot and broke many a slip and fall. Everywhere a stunted growth of yellow birch, mountain-ash, and spruce and fir opposed our progress. The ascent at such an angle with a roll of blankets on your back is not unlike climbing a tree; every limb resists your progress and pushes you back, so that when we at last reached the summit, after twelve or fifteen hundred feet of this sort of work, the fight was about all out of the best of us. It was then nearly 2 o'clock, so that we had been about seven hours in coming seven miles.

Here on the top of the mountain we overtook spring, which had been gone from the valley nearly a month. Red clover was opening in the valley below and wild strawberries were just ripening; on the summit the yellow birch was just hanging out its catkins, and the claytonia, or spring beauty, was in bloom. The leaf-buds of the trees were just bursting, making a faint mist of green, which, as the eye swept downward, gradually deepened until it became a dense, massive cloud in the valleys. At the foot of the mountain the Clinton, or northern green lily, and the low shad bush were showing the berry, but long before the top was reached they were found in bloom. I had never before stood amidst blooming claytonia, a flower of April, and looked down upon a field that held ripening strawberries. Every thousand feet of elevation seemed to

make about ten days' difference in the vegetation, so that the season was a month or more later on the top of the mountain than at its base. A very pretty flower which we began to meet well up on the mountain-side was the painted trillium, the petals white, veined with pink.

The low, stunted growth of spruce and fir which clothes the top of Slide has been cut away over a small space on the highest point, laying open the view on nearly all sides. Here we sat down and enjoyed our triumph. We saw the world as the hawk or the balloonist sees it when he is 3000 feet in the air. How soft and flowing all the outlines of the hills and mountains beneath us looked! The forests dropped down and undulated away over them, covering them like a carpet. To the east we looked over the near-by Wittenburg range to the Hudson and beyond; to the south Peak-o'-Moose, with its sharp crest, and Table Mountain, with its long level top, were the two conspicuous objects; in the west, Mt. Graham and Double Top, about 3800 feet each, arrested the eye; while in our front, to the north, we looked over the top of Panther Mountain to the multitudinous peaks of the northern Catskills. All was mountain and forest on every hand. Civilization seemed to have done little more than to have scratched this rough, shaggy surface of the earth here and there. In any such view, the wild, the aboriginal, the geographical greatly predominate. The works of man dwindle, and the original features of the huge globe come out. Every single object or point is dwarfed; the valley of the Hudson is only a wrinkle in the earth's surface. You discover with a feeling of surprise that the great thing is the earth itself, which stretches away on every hand so far beyond your sight.

The Arabs believe that the mountains steady the earth and hold it together; but they had only to get on the top of a high one to see how insignificant they are, and how adequate the earth looks to get along without them. To the imaginative Oriental people mountains seemed to mean much more than they do to us. They were sacred; they were the abodes of their divinities. They offered their sacrifices upon them. In the Bible mountains are used as a symbol of that which is great and holy. Jerusalem is spoken of as a holy mountain. The Syrians were beaten by the children of Israel because, said they, "Their gods are gods of the hills; therefore were they stronger than we." It was on Mount Horeb that God appeared to Moses in the burning bush, and on Sinai that he delivered to him the law. Josephus says that the Hebrew shepherds never pasture their

flocks on Sinai, believing it to be the abode of Jehovah. The solitude of mountain-tops is peculiarly impressive, and it is certainly easier to believe that the Deity appeared in a burning bush there than in the valley below. When the clouds of heaven too come down and envelop the top of the mountain — how such a circumstance must have impressed the old God-fearing Hebrews! Moses knew well how to surround the law with the pomp and circumstance that would inspire the deepest awe and reverence.

But when the clouds came down and enveloped us on Slide Mountain the grandeur, the solemnity, was gone in a twinkling; the portentous-looking clouds proved to be nothing but base fog, that wet us and extinguished the world for us. How tame, and prosy, and humdrum the scene instantly became! But when the fog lifted, and we looked from under it as from under a just-raised lid, and the eye plunged again like an escaped bird into those vast gulfs of space that opened at our feet, the feeling of grandeur and solemnity quickly came back.

The first want we felt on the top of Slide, after we had got some rest, was a want of water. Several of us cast about, right and left, but no sign of water was found. But water must be had; so we all started off determined to hunt it up. We had not gone many hundred yards before we chanced upon an ice-cave beneath some rocks — vast masses of ice, with crystal pools of water near. This was good luck indeed, and put a new and brighter face on the situation.

Slide Mountain enjoys a distinction which no other mountain in the State, so far as is known, does — it has a thrush peculiar to itself. This thrush was discovered and described by Eugene Bicknell of New York in 1880, and has been named Bicknell's thrush. A better name would have been Slide Mountain thrush, as the bird, so far as I know, has only been found on that mountain. I did not see or hear it upon the Wittenburg, which is only a few miles distant. In its appearance to the eye among the trees one would not distinguish it from the gray-cheeked thrush of Baird, or the olive-backed thrush, but its song is totally different. The moment I heard it I said, "There is a new bird, a new thrush," as the quality of all thrush songs is the same. A moment more and I knew it was Bicknell's thrush. The song is in a minor key, finer, more attenuated, and more under the breath than that of any other thrush. It seemed as if the bird was blowing in a delicate, slender, golden tube, so fine and yet so flute-like and resonant the song appeared. At times it was like a musical whisper of great sweetness and power.

The birds were numerous about the summit, but we saw them nowhere else. No other thrush was seen, though a few times during our stay I caught a mere echo of the hermit's song far down the mountain-side. A bird I was not prepared to see or hear was the black poll warbler, a bird usually found much farther north, but here it was amidst the balsam firs uttering its simple, lisping song.

The rocks on the tops of these mountains are quite sure to attract one's attention, even if one have no eye for such things. They are masses of light reddish conglomerate, composed of round, wave-worn quartz pebbles. Every pebble had been shaped and polished upon some ancient sea-coast, probably the Devonian. The rock disintegrates where it is most exposed to the weather and forms a loose sandy and pebbly soil. These rocks form the floor of the coal formation, but in the Catskill region only the floor remains; the superstructure has never existed or has been swept away; hence one would look for a coal mine here over his head in the air, rather than under his feet.

This rock did not have to climb up here as we did; the mountain stooped and took it upon its back in the bottom of the old seas, and then got lifted up again. This happened so long ago that the memory of the oldest inhabitant of these parts yields no clew to the time.

A pleasant task we had in re-flooring and re-roofing the log hut with balsam boughs against the night. Plenty of small balsams grew all about, and we soon had a huge pile of their branches in the old hut. What a transformation, this fresh green carpet and our fragrant bed, like the deep-furred robe of some huge animal wrought in that dingy interior! Two or three things disturbed our sleep. A cup of strong beef-tea taken for supper disturbed mine; then the porcupines kept up such a grunting and chattering near our heads, just on the other side of the logs, that sleep was difficult. In my wakeful mood I was a good deal annoyed by a little rabbit that kept whipping in at our dilapidated door and nibbling at our bread and hard-tack. He persisted even after the gray of the morning appeared. Then about 4 o'clock it began gently to rain. I think I heard the first drop that fell. My companions were all in sound sleep. The rain increased, and gradually the sleepers awoke. It was like the tread of an advancing enemy which every ear had been expecting. The roof over us was of the poorest, and we had no confidence in it. It was made of the thin bark of spruce and balsam, and was full of hollows and depressions. Presently these hollows got full of water, when

there was a simultaneous downpour of bigger and lesser rills upon the sleepers beneath. Said sleepers, as one man, sprang up, each taking his blanket with him; but by the time some of the party had got themselves stowed away under the adjacent rock, the rain ceased. It was little more than the dissolving of the night-cap of fog which so often hangs about these heights. With the first appearance of the dawn I had heard the new thrush in the scattered trees near the hut — a strain as fine as if blown upon a fairy flute, a suppressed musical whisper from out the tops of the dark spruces. Probably never did there go up from the top of a great mountain a smaller song to greet the day, albeit it was of the purest harmony. It seemed to have in a more marked degree the quality of interior reverberation than any other thrush song I had ever heard. Would the altitude or the situation account for its minor key? Loudness would avail little in such a place. Sounds are not far heard on a mountain-top; they are lost in the abyss of vacant air. But amidst these low, dense, dark spruces, which make a sort of canopied privacy of every square rod of ground, what could be more in keeping than this delicate musical whisper? It was but the soft hum of the balsams, interpreted and embodied in a bird's voice.

It was the plan of two of our companions to go from Slide over into the head of the Rondout, and thence out to the railroad at the little village of Shokan, an unknown way to them, involving nearly an all-day pull the first day through a pathless wilderness. We ascended to the topmost floor of the tower, and from my knowledge of the topography of the country I pointed out to them their course, and where the valley of the Rondout must lie. The vast stretch of woods, when it came into view from under the foot of Slide, seemed from our point of observation very uniform. It swept away to the south-east, rising gently towards the ridge that separates Lone Mountain from Peak-o'-Moose, and presented a comparatively easy problem. As a clew to the course, the line where the dark belt or saddle-cloth of spruce which covered the top of the ridge they were to skirt ended and the deciduous woods began, a sharp, well-defined line, was pointed out as the course to be followed. It led straight to the top of the broad level-backed ridge which connected two higher peaks and immediately behind which lay the head-waters of the Rondout. Having studied the map thoroughly and possessed themselves of the points, they rolled up their blankets about 9 o'clock and were off, my friend and myself purposing to spend yet another day and night on Slide. As our friends plunged down

into that fearful abyss, we shouted to them the old classic caution, "Be bold, be bold, be not *too* bold." It required courage to make such a leap into the unknown as I knew those young men were making, and it required prudence. A faint heart or a bewildered head, and serious consequences might have resulted. The theory of a thing is so much easier than the practice. The theory is in the air, the practice is in the woods; the eye, the thought, travel easily where the foot halts and stumbles. However, our friends made the theory and the fact coincide; they kept the dividing line between the spruce and the birches, and passed over the ridge into the valley safely; but they were torn and bruised, and wet by the showers, and made the last few miles of their journey on will and pluck alone, their last pound of positive strength having been exhausted in making the descent through the chaos of rocks and logs into the head of the valley. In such emergencies one overdraws his account; he travels on the credit of the strength he expects to gain when he gets his dinner and some sleep. Unless one has made such a trip himself (and I have several times in my life) he can form but a faint idea what it is like — what a trial it is to the body and what a trial it is to the mind. You are fighting a battle with an enemy in ambush. How those miles and leagues which your feet must compass lie hidden there in that wilderness; how they seem to multiply themselves; how they are fortified with logs, and rocks, and fallen trees; how they take refuge in deep gullies, and skulk behind unexpected eminences! Your body not only feels the fatigue of the battle, your mind feels the strain of the undertaking; you may miss your mark; the mountains may out-manceuvre you. All that day, whenever I looked down upon that treacherous wilderness, I thought with misgivings of those two friends groping their way there, and would have given something to have known how it fared with them. Their concern was probably less than my own, because they were more ignorant of what was before them. Then there was just a slight shadow of fear in my mind that I might have been in error about some points of the geography I had pointed out to them. But all was well, and the victory was won according to the campaign which I had planned. When we saluted our friends upon their own doorstep a week afterward, the wounds were nearly all healed and the rents all mended.

When one is on a mountain-top he spends most of the time in looking at the show he has been at such pains to see. About every hour we would ascend the rude lookout to take a fresh observation. With a glass I could

see my native hills forty miles away to the north-west. I was now upon the back of the horse, yea, upon the highest point of his shoulders, which had so many times attracted my attention as a boy. We could look along his balsam-covered back to his rump, from which the eye glanced away down into the forests of the Neversink, and on the other hand plump down into the gulf where his head was grazing or drinking. During the day there was a grand procession of thunder-clouds filing along over the northern Catskills, and letting down veils of rain and enveloping them. From such an elevation one has the same view of the clouds that he has from the prairie or the ocean. They do not seem to rest across and to be upborne by the hills, but they emerge out of the dim west, thin and vague, and grow and stand up as they get nearer and roll by him, on a level but invisible highway, huge chariots of wind and storm.

In the afternoon a thick cloud threatened us, but it proved to be the condensation of vapor that announces a cold wave. There was soon a marked fall in the temperature, and as night drew near it became pretty certain that we were going to have a cold time of it. The wind rose, the vapor above us thickened and came nearer, until it began to drive across the summit in slender wraiths, which curled over the brink and shut out the view. We became very diligent in getting in our night wood and in gathering more boughs to calk up the openings in the hut. The wood we scraped together was a sorry lot,—roots and stumps and branches of decayed spruce, such as we could collect without an ax, and some rags and tags of birch bark. The fire was built in one corner of the shanty, the smoke finding easy egress through large openings on the east side and in the roof over it. We doubled up the bed, making it thicker and more nest-like, and as darkness set in stowed ourselves into it beneath our blankets. The searching wind found out every crevice about our heads and shoulders, and it was icy cold. Yet we fell asleep, and had slept about an hour when my companion sprang up in an unwonted state of excitement for so placid a man. His excitement was occasioned by the sudden discovery that something like a bar of ice was fast taking the place of his backbone. His teeth chattered and he was convulsed with ague. I advised him to replenish the fire, and to wrap himself in his blanket and cut the liveliest capers he was capable of in so circumscribed a place. This he promptly did, and the thought of his wild and desperate dance there in the dim light, his tall form, his blanket flapping, his teeth chattering, the

porcupines outside marking time with their squeals and grunts, still provokes a smile, though it was a serious enough matter at the time. After a while the warmth came back to him, but he dared not to trust himself again to the boughs; he fought the cold all night as one might fight a besieging foe. By carefully husbanding the fuel, the beleaguering enemy was kept at bay till morning came; but when morning did come, even the huge root he had used as a chair was consumed. Rolled in my blanket beneath a foot or more of balsam boughs, I had got some fairly good sleep, and was most of the time oblivious to the melancholy vigil of my friend. As we had but a few morsels of food left, and had been on rather short rations the day before, hunger was added to his other discomforts. At that time a letter was on the way to him from his wife, which contained the prophetic sentence, "I hope thee is not suffering with cold and hunger on some lone mountain-top."

Mr. Bicknell's thrush struck up again at the first signs of dawn, notwithstanding the cold. I could hear his penetrating and melodious whisper as I lay buried beneath the boughs. Presently I arose and invited my friend to turn in for a brief nap, while I gathered some wood and set the coffee brewing. With a brisk, roaring fire on, I left for the spring to fetch some water and to make my toilet. The leaves of the mountain golden-rod, which everywhere covered the ground in the opening, were covered with frozen particles of vapor, and the scene, shut in by fog, was chill and dreary enough.

We were now not long in squaring an account with Slide, and making ready to leave. Round pellets of snow began to fall, and we came off the mountain on the 10th of June in a November storm and temperature. Our purpose was to return by the same valley we had come. A well-defined trail led off the summit to the north; to this we committed ourselves. In a few minutes we emerged at the head of the slide that had given the mountain its name. This was the path made by visitors to the scene. When it ended, the track of the avalanche began: no bigger than your hand apparently had it been at first, but it rapidly grew, until it became several rods in width. It dropped down from our feet straight as an arrow until it was lost in the fog, and looked perilously steep. The dark forms of the spruce were clinging to the edge of it, as if reaching out to their fellows to save them. We hesitated on the brink, but finally cautiously began the descent. The rock was quite naked and slippery, and only on the margin of the Slide were there any boulders to stay the foot, or bushy growths to aid the hand. As we

paused, after some minutes, to select our course, one of the finest surprises of the trip awaited us: the fog in our front was swiftly whirled up by the breeze, like the drop-curtain at the theater, only much more rapidly, and in a twinkling the vast gulf opened before us. It was so sudden as to be almost bewildering. The world opened like a book and there were the pictures; the spaces were without a film, the forests and mountains looked surprisingly near; in the heart of the northern Catskills a wild valley was seen flooded with sunlight. Then the curtain ran down again, and nothing was left but the gray strip of rock to which we clung, plunging down into the obscurity. Down and down we made our way. Then the fog lifted again. It was Jack and his bean-stalk renewed; new wonders, new views, awaited us every few moments, till at last the whole valley below us stood in the clear sunshine. We passed down a precipice and there was a rill of water, the beginning of the creek that wound through the valley below; farther on, in a deep depression, lay the remains of an old snow-bank: winter had made his last stand here, and April flowers were springing up almost amidst his very bones. We did not find a palace, and a hungry giant, and a princess, etc., at the end of our bean-stalk, but we found a humble roof and the hospitable heart of Mrs. Larkins, which answered our purpose better. And we were in the mood, too, to have undertaken an eating bout with any giant that Jack ever discovered.

Of all the retreats that I have found amidst the Catskills there is no other that possesses quite so many charms for me as this valley, wherein stands Larkins's humble dwelling; it is so wild, so quiet, and has such superb mountain views. In coming up the valley, you have apparently reached the head of civilization a mile or more lower down; here the rude little houses end, and you turn to the left into the woods. Presently you emerge into a clearing again, and before you rises the rugged and indented crest of Panther Mountain, and near at hand, on a low plateau, rises the humble roof of Larkins, — you get a picture of the Panther and of the homestead at one glance. Above the house hangs a high, bold cliff covered with forest, with a broad fringe of blackened and blasted tree-trunks, where the cackling of the great pileated woodpecker may be heard; on the left a dense forest sweeps up to the sharp, spruce-covered cone of the Wittenburg, nearly four thousand feet high; while at the head of the valley rises Slide over all. From a meadow just back of Larkins's barn a view may be had of all these mountains, while the terraced side of Cross Mountain bounds the view immediately to the east. Running from the top of Panther to-

wards Slide one sees a gigantic wall of rock, crowned with a dark line of fir. The forest abruptly ends, and in its stead rises the face of this colossal rocky escarpment, like some barrier built by the mountain gods. Eagles might nest here. It breaks the monotony of the world of woods very impressively.

I delight in sitting on a rock in one of these upper fields and seeing the sun go down behind Panther. The rapid-flowing brook below me fills all the valley with a soft murmur. There is no breeze, but the great atmospheric tide flows slowly in towards the cooling forest; one can see it by the motes in the air illuminated by the setting sun: presently, as the air cools a little, the tide turns and flows slowly out. The long, winding valley up to the foot of Slide, five miles of primitive woods, how wild and cool it looks, its one voice the murmur of the creek! On the Wittenburg the sunshine long lingers; now it stands up like an island in a sea of shadows, then slowly sinks beneath the wave. The evening call of a robin, or a thrush at his vespers, makes a marked impression on the silence and the solitude.

The following day my friend and I pitched our tent in the woods beside the stream where I had pitched it twice before and passed several delightful days, with trout in abundance and wild strawberries at intervals. Mrs. Larkins's cream-pot, butter-jar, and bread-box were within easy reach. Near the camp was an unusually large spring, of icy coldness, which served as our refrigerator. Trout or milk immersed in this spring in a tin pail would keep sweet four or five days. One night some creature, probably a lynx or a wildcat, came and lifted the stone from the pail that held the trout and took out a fine string of them and ate them up on the spot, leaving only the string and one head. In August bears come down to an ancient and now brushy bark peeling near by for blackberries. But the creature that most infests these backwoods is the porcupine. He is as stupid and indifferent as the skunk; his broad, blunt nose points a witless head. They are great gnawers, and will gnaw your house down if you are not watchful. Of a summer evening they will walk coolly into your open door if not prevented. The most annoying animal to the camper-out in this region, and the one he needs to be most on the lookout for, is the cow. Backwoods cows and young cattle seem always to be famished for salt, and they will fairly lick the fisher-

man's clothes off his back, and his tent and equipage out of existence, if he give them a chance. On one occasion some wood-ranging heifers and steers that had been hovering around our camp for some days made a raid upon it when we were absent. The tent was shut and everything snugged up, but they ran their long tongues under the tent, and, tasting something savory, hooked out John Stuart Mill's "Essays on Religion," which one of us had brought along thinking to read in the woods. They mouthed the volume around a good deal, but its logic was too tough for them, and they contented themselves with devouring the paper in which it was wrapped. If the cattle had not been surprised at just that point, it is probable the tent would have gone down before their eager curiosity and their thirst for salt.

The raid which Larkins's dog made upon our camp was amusing rather than annoying. He was a very friendly and intelligent shepherd dog, probably a collie. Hardly had we sat down to our first lunch in camp before he called on us. But as he was disposed to be too friendly, and to claim too large a share of the lunch, we rather gave him the cold shoulder. He did not come again; but a few evenings afterward, as we sauntered over to the house on some trifling errand, the dog suddenly conceived a bright little project. He seemed to say to himself, on seeing us, "There come both of them now, just as I have been hoping they would; now while they are away I will run quickly over and know what they have got that a dog can eat." My companion saw the dog get up on our arrival, and go quickly in the direction of our camp, and he said that something in the cur's manner suggested to him the object of his hurried departure. He called my attention to the fact, and we hastened back. On cautiously nearing camp, the dog was seen amidst the pails in the shallow water of the creek, investigating them. He had uncovered the butter and was about to taste it when we shouted, and he made quick steps for home, with a very "kill-sheep" look. When we again met him at the house next day he could not look us in the face, but sneaked off, utterly crestfallen. This was a clear case of reasoning on the part of the dog, and afterward a clear case of the sense of guilt from wrong-doing. The dog will probably be a man before any other animal is.

John Burroughs.

THE PULPIT FOR TO-DAY.

INTO the United States God has poured a vast heterogeneous population. The picture which John painted in the Apocalypse may be seen here, with a difference: men gathered out of all nations, and kindreds, and peoples, and tongues, but not before the throne of God, nor praising him. Every phase of individual character is here represented; every race, every nationality, every language, every form of religion. Here are the Irishman, the Englishman, the Frenchman, the Swede, the Norwegian, the German, the Hungarian, the Pole, the Italian, the Spaniard, the Portuguese. Here are the Celt, the Anglo-Saxon, the African, the Malay. Here is the negro, with his emotional religion; the Roman Catholic, with his ceremonial religion; the Puritan, with his intellectual religion; and the unbelieving German, with his no religion at all. Hither they have come trooping, sometimes beckoned by us, sometimes thrust upon us, sometimes invading us; but, welcome or unwelcome, still they come. To America the language of the ancient Hebrew prophet may be almost literally applied:

The sons of strangers also shall build thy walls,
And their kings shall serve thee;

Thy gates also shall be open continually;
They shall not be shut by day nor by night;
That men may bring unto thee the forces of the Gentiles,
And that their kings may be brought.*

This heterogeneous people occupy a land which embraces every variety of climate from northern Europe to middle Asia, and every variety of wealth from the wheat fields of Russia to the silver mines of Golconda. Its fertile soil gives every variety of production from the pine-trees of Maine to the orange groves of Florida. It has for agriculture vast prairies of exhaustless wealth; for mines, mountains rich in coal, iron, copper, silver, gold; for mills, swift running rivers; for carriage, slow and deep ones; and for commerce, a harbor-indented coast line, lying open to two oceans and inviting the commerce of both hemispheres. I do not dwell upon the magnificence of this endowment,—that is a familiar aspect,—but upon its diversity. The nation which occupies such

a land must be diverse in industry as it is heterogeneous in population. The simplicity of social and industrial organization has long since passed away. There are few richer men in the world than in America, and none who have amassed such wealth in so short a time; there are no poorer men in the world, and nowhere men whose poverty is so embittered by disappointed hopes and shattered ambitions. In the Old World men are born to poverty, and accept their predestined lot with contentment, if not with cheerfulness. In America the ambitious youth sees a possible preferment in the future; counts every advance only a step towards a further advancement, and attributes every failure to injustice or ill-luck. Society, thus made up of heterogeneous population, subjected to the educational influence of widely differing religions, engaged in industries whose interests often seem to conflict, if they actually do not, and separated into classes by continually shifting partition walls, is kept in perpetual ferment by the nature of its educational, political, and social institutions. The boys of the rich and the poor sit by each other's side in the same school-room; their fathers brush against each other in the same conveyance. The hod-carrier and the millionaire hang by the same strap, and sway against each other in the same horse-car. Every election brings rich and poor, cultivated and ignorant, into line to deposit ballots of equal weight in the same ballot-box, and makes it the interest of each to win the suffrage of the other for his candidate and his party. The caldron, political and ecumenical, is always seething and boiling; the bottom thrown to the top, the top sinking in turn to the bottom. The canal-boat driver becomes President; the deck hand a railroad magnate. The son of the President mingles with the masses of the people in the battle for position and preferment, and the son of yesterday's millionaire is to-morrow earning his daily bread by the sweat of his brow. In the Old World men live like monks in a monastery; each class, if not each individual, has its own cell. Here all walls are down, and all classes live in commons. All this is familiar; it is enough here to sketch it in the barest outlines; for my only purpose in recalling it is to ask the reader to consider what is its moral meaning. It can have but one. Into this continent God has thrown this heterogeneous people, in this effervescent and seething mass, that in the struggle they may learn the laws

* Isaiah lx. 10, 11. The whole chapter applies in a remarkable manner to the present condition of the United States.

of social life. African, Malay, Anglo-Saxon, and Celt, ignorant and cultivated, rich and poor, he flings us together under institutions which inextricably intermix us, that he may teach us by experience the meaning of the brotherhood of man.

Our national history confirms this interpretation—if any confirmation were needed. The questions of our national history have all been social, not theological. We can hardly conceive that battles were fought, as bitter as our civil war, over the question whether God should be defined as existing in one Person or in three; whether the Son should be defined as proceeding from the Father or created by Him; whether he should be described as of the same substance or only as of like substance. We can hardly conceive that Europe was plunged into fierce wars by the question whether righteousness was imputed or imparted. But these were the real questions of the past, and if they seem insignificant to us now, it is only because we do not look beneath the form to the substance of the issues involved—issues as sublime as ever demanded the supremest concentration and the most devoted zeal of men. For these questions men once willingly died; for them they now unwillingly keep awake for half an hour of a Sunday afternoon. The questions for which we have fought, and are willing to fight again if need be, are questions of a different sort. Slavery, temperance, labor and capital, the tariff, public education: these present the questions of our national life, and they are all aspects and phases of one question—What are the divine laws of social life? Are there any principles of government, known or discoverable, which will enable men who differ in origin, in condition, in race, and in religious belief to live harmoniously together in one commonwealth—that is, in one social and political organization, fashioned and carried on so as to promote their common welfare?

This is certainly a question which the clergy and the Church must help to answer. It is emphatically a religious question.* If the Church does not interest itself in what concerns humanity, it cannot hope that humanity will interest itself in what concerns the Church. Why, indeed, should it? If the Church shelters itself under the plea that religion is a matter between the individual soul and God, it adopts a very much narrower definition of religion than that of the Bible. The Hebrew prophet who asked, "What doth the Lord require of thee, but to do justly, and to love mercy, and to walk humbly with thy

God?" had a conception of religion two parts of which have to do with our relations to our fellow-men, and one part with our relations to God. Christ's summary of the law and the prophets puts as much emphasis on the brotherhood of man as on the fatherhood of God. Indeed, it could not be otherwise. A religion which did not teach us how to live on earth would have small claims upon our respect when it claimed to teach us how to prepare for heaven. A captain who does not know how to manage a ship at sea cannot be trusted to bring her into port. A teacher who cannot tell his boys how to get along with each other in school is not the man to prepare them to get along with each other as men in manhood. Christianity is not merely individual; it is organic. That Judaism is so no Bible student will for a moment question. It deals mainly with organisms—religious organization in an established church, political organization in a Jewish commonwealth. Hebrew scholars even doubt whether the Old Testament knows anything about a future life; it certainly concerns itself mainly about the life that now is. The New Testament equally concerns itself with social organization. It undertakes to build up, not merely individual Christians here and there, but a Christian society. Christ begins his mission by proclaiming that the kingdom of God is at hand. His first published sermon is an explanation of the duties which men owe to one another, and of the principles on which they are to act, if the kingdom of righteousness and peace is ever to be established on the earth. His second sermon is a prophetic survey of the processes by which that kingdom will be developed. He does not lay more stress upon the declaration, "One is your Master, even Christ," than upon the accompanying declaration, "All ye are brethren." The minister who does not discover laws of social life in the Bible has studied it to very little purpose. The minister who does not teach those laws does not follow the example of either the Old Testament prophets, the New Testament apostles, or the divine Master of both.

To whom else shall the people look for instruction in the moral principles of a true social order if not to the ministry? Shall they look to the politicians? I am not going to enter upon any cheap satire of the politicians. They are like the preachers, some good and some bad. But, good or bad, their function in a democracy is not to inculcate, still less to discover, great principles. They are executive officers, not teachers. They are appointed to formulate in law and so set in motion the principles which, under the instruction of

* "Every political question is rapidly becoming a social question, and every social question a religious question."—*Mazzini*.

others, the people have adopted. This is what more or less effectively they are doing; and this is what they ought to do. The politician is not a motive power; he is a belting, and connects the motive power with the machinery. He gets things done when the people have determined what they want done. The bankers and financiers deliberate and discuss, and when the popular determination as to currency is reached as the result of this discussion, Congress incorporates it in a law. The politicians will never determine what is the best legal method of dealing with the liquor traffic. When the people have determined, the politicians may be trusted to carry that determination into effect. The people cannot learn the moral laws of the social order from the politicians; the politicians must learn them from the people. The master does not take orders from his servant; the servant takes them from his master. Shall we then look to the editors for moral instruction in sociology? The editors ought to be public teachers, but with few exceptions they have abdicated. The secular press is devoted to secular news-gathering and to party service; the religious press, to ecclesiastical news-gathering and denominational service. There are some notable exceptions, but they do but prove the rule. Not long since I heard the editor of one of the wealthiest and most successful, though not most influential, of American journals say in a public debate, that the daily paper was organized to make money, and that was what it ought to be organized for. So long as this is deemed true by the editors, the newspaper cannot be a teacher. The world has never paid for leadership until the leader was dead. Such a press can only crystallize the public sentiment which others have created, and so make efficacious a feeling which otherwise would effervesce in emotion. This it does, and for this service we are duly grateful. But it cannot — at least it generally does not — do the work of an investigator. It does not discover laws of life. It does not create; it only represents. It is a reservoir, without which the mill could not be driven; but the reservoir must itself be fed by the springs among the hills. The real formers of public opinion are the teachers and the preachers, the schools and the churches. The former are necessarily empirical; they deduce the laws of life from a study of past experience. The latter ought to be prophets. Their sympathy with all classes of men, their common contact with rich and poor, their opportunities for reflection and meditation, and their supposed consecration to a work wholly unselfish and disinterested, ought to combine with their piety to give them that insight into life which has always

been characteristic of a prophetic order. I do not mean to demand of the ministry the impossible; but if this is not their function, it would be difficult to say what function they have. They cannot formulate public opinion in laws as well as the politicians; they cannot represent that public opinion which is already formed as well as the journalists; they cannot extract the truth from a scientific study of life as well as the teacher and the scholar. But so far as natural selection, aided by special studies and a generally quiet life, can equip any class of men for a prophetic function, and so fit them to discern the great moral laws of the social order, the ministry are so equipped. If they will leave the professional teachers to expound the secular, that is, the empirical side of social science, the newspapers to reflect the conclusions respecting such science as are formed, and the politicians to embody those opinions and principles in law, and will devote themselves to the spiritual study of the Book, and of life,—that book which is always being written and is never finished,—they can be leaders of the leaders. They can lay the foundations on which other men shall rear the superstructure. They speak, or can speak, to all classes in the community, for they belong to none. They address audiences of personal friends, whom they have counseled and aided in the hours when friendship is the most full of sweet significance. They speak to these friends at a time when baser passions are allayed and moral sentiments are awakened. The very smallness of their auditory as compared with that of the journalist adds force to their counsels and affords protection from misapprehension.

The pulpit for to-day, then, must be competent to give instruction in the moral laws which govern social and industrial life—the organized life of humanity. The age requires this instruction; the people desire it; the ministers should give it.

It cannot be expected in such a paper as this that I should attempt to unfold a Christian sociology. This has yet to be done, by the interchange of many opinions, and the interaction of many minds. I may, however, indicate certain lines of thought as illustrative of the kind of teaching which the exigency of the nineteenth century demands of the pulpits in America.

I. What is the Christian law of liberty?

"The true liberty of a man," says Carlyle, "you would say consisted in his finding out, or being forced to find out, the right path and to walk therein. To learn or be taught what work he was actually able to do; and then by permission, persuasion, or even compulsion to be set about doing of the same. . . .

O! if thou really art my senior, seigneur, my Elder, Presbyterian, or Priest — if thou art in any way my *wiser*, may a beneficent instinct lead and impel thee to conquer and command me. If thou do know better than I what is good and right, I conjure you in the name of God, force me to do it; were it by never such brass collars, whips, and handcuffs, leave me not to walk over precipices!"*

No! this is not liberty; it is servitude. Servitude may be better than walking over precipices; it may be in every way justifiable if the freeman be a lunatic, and is bent upon pushing men weaker than himself over precipices. But it is not liberty. We hold in this country that men can be kept from walking over precipices, or thrusting their fellows over, without the use of brass collars, whips, and handcuffs; but how this is to be done we do not yet, I fear, very clearly discern. When the mob of anarchists, aroused to frenzy by the appeals of Most and Parsons and Spies, march to burn and kill and destroy, and are met by steel bayonets and whistling rifle-balls, we have come to Carlyle's definition of liberty, to brass collars, whips, and handcuffs. These are preferable to the precipice; but they are not liberty. "Liberty," says Webster's Dictionary, "is ability to do as one pleases." "Freedom is exemption from the power and control of another." How can a great heterogeneous people, made up of every nationality, race, class, and religion, be thus free, be endowed with this ability to do as they severally please? For if Webster is right, liberty is a large ability. It is power; it is competence.

On my lawn is a goat tethered by a rope to a stake. He is not at liberty. Why not cut the rope and let him go where and do as he pleases? Because, if I do, he will gnaw the bark of the young trees, trample down the garden beds, pull up the strawberry plants by the roots. In a word, because he is not able to perceive and be obedient to an invisible law, he must be subjected to a visible and tangible one. If it were possible to train him so that he would leave the young trees alone, would keep out of the garden, and would eat only the grass and the burdocks, of which latter he is fond, and which we should be glad to have him destroy, he might be set free, to go where and do what he pleases. Because he cannot be taught to please to do right, he must be tethered. We have also a collie dog. Fond as he is of a ramble with his young masters, the boys have only to say to him, "No, Victor; go home," and he lies quietly down on the lawn and looks wistfully and pathetically after them. Formerly they had to tie him when they went off for a ramble. But he has

learned obedience, and therefore has acquired liberty. This is a very simple illustration of a very simple truth; namely, that liberty is not exemption from law; it is spiritual perception of and voluntary obedience to law. The goat can never be made free, because it can never be taught to perceive and to respect the invisible law. Law and liberty are not opposites. We come into liberty when we become a law unto ourselves. Liberty and independence are not synonymous; liberty is voluntary subjection.

Aristotle classifies government in three classes — government by the one, government by the few, government by the many. We have added in America a fourth class — self-government. The mass cannot do what all the individuals in the mass are incapable of doing. If the individual American cannot govern himself, the American people cannot govern themselves. A pack of wolves is no more capable of freedom than is a single wolf. The first condition of self-government in a community is that each individual should possess the power of self-government in himself. Each individual must be endowed with ability to do as he pleases or the state cannot be free. If even a considerable minority are engaged in schemes for pushing their fellows over the precipice, we must have recourse to Carlyle's brass collars, whips, and handcuffs. But the first condition of self-government is the ability to recognize an invisible law, and to subject one's self to its restraint. This is what Isaiah means when, in that resplendent picture of peaceful industry replacing war, he declares that the law shall go out of Zion. This is what Christ means when he says, "If the Son shall make you free, ye shall be free indeed." The law of liberty is the supremacy of the individual conscience in the individual life. It is the law written within, and therefore needing no whips and handcuffs imposed from without. If ever our churches by their preaching shall lighten the sanctity of the divine law, shall suffer the people to forget that the Father of mankind is also its lawgiver, shall let the Old Testament, with its Thou shalt and Thou shalt not, drift into obscurity; if ever the ties of family life are loosened, and children forget to honor their father and their mother, and to obey their parents in the Lord; if ever the community comes to entertain a contempt for its appointed law-makers and its interpreters of law, and to allow its self-imposed requirements to be disregarded with impunity; if ever sheriffs and governors dally with mobs, entreating where they should command, and giving promises where they should give shot and ball; if ever Justice drops her sword and wishes to retain her office by virtue of her scales alone; if ever

* "Past and Present," p. 213.

entire states are allowed to disserve their allegiance to the constitution of the land and fight for lawlessness and call it liberty — unless in that hour there are ministers in the pulpits to recall Mount Sinai, and fathers to remember the story of Eli, and governors to bear the sword not in vain, and a national determination to maintain liberty by maintaining law at any cost of blood and treasure, the end of the republic will not be far distant.

"Despotism may govern without faith," says De Tocqueville, "but liberty cannot. Religion is much more necessary in the republic which they [the atheistic republicans] set forth in glowing colors than in the monarchy which they attack; it is more needed in democratic republics than in any other. How is it possible that societies should escape destruction, if the moral tie be not strengthened in proportion as the political tie is relaxed? And what can be done with a people who are their own masters, if they be not submissive to the Deity?"*

That question I leave to the reflection of the reader.

II. What is the Christian conception of labor?

Throughout the Middle Ages war was the only honorable pursuit. He who plundered others was knighted; he who clothed the naked earth with fertility by his toil was a villain. Down to our own time, in England, the only refuge of the younger sons of the nobility has been the Church, the army, and the civil service. The scion of noble stock might walk the deck of a man-of-war, but if he drove a nail in making her iron sides he was an outcast. He might preach borrowed sermons in the pulpit, but if he were to do one honest day's work in laying up the stone work or shaping the rafters of the church he became a pariah. Nor can we say that even in American society this conception of labor as an indignity has no root and breathes out no pernicious odor upon the air. The iron masters of the Lehigh Valley tell me that they cannot find workingmen enough and must send to Europe for them; the Pacific coast is beginning to ask, If the Chinese must go, who can be found to till our vineyards, and tend our small fruits, and make our vegetable gardens for us? But almost every village has too many lawyers for justice, too many doctors for health, too many shopkeepers for trade, and too many ministers for good morals. Twice in the last two or three years I have received letters from fathers saying, "My son wants to be a farmer; I should like to send him to college and fit him for a profession. What should I better do?" What

nobler profession is there than to obey God's mandate to Adam, to dress the earth and keep it; to win back a Garden of Eden from the thistle-cursed wilderness? So far has this conception of labor as an indignity entered into thought, that the Church itself imagines that toil was inflicted upon man as a penalty for sin. Our systems of education are corrupted by this servile conception of labor. The brain is educated, but not the eye to see, nor the hand to fashion, nor the muscle to do, nor the body to endure. We live in a country which clamors for men who know how to compel reluctant Nature to disclose her secrets; and yet it is hardly a quarter of a century since scientific schools were engrafted on even our higher education; and not yet are the simplest principles which underlie the industries of the vast majority of our people inculcated in our public schools, or known to the teachers in them. Seven and a half millions of men are engaged in various agricultural employments, that require for their best prosecution an intelligent comprehension of the chemistry of nature, of comparative physiology, and of the great laws of trade on which the markets of the world depend; but the student may go through the entire curriculum of the public school — primary school, grammar school, high school, and even State university — and hardly know that there is a chemistry of nature, or that a comparison of the physiological structure of the animal race has been made, unless in his later years he has learned these facts in an "optional." The highest ambition of the laborer in the lower ranks of the hierarchy of labor is to reduce his hours from twelve to ten, or from ten to eight, or even from eight to six; and the highest ambition of the laborer in the higher ranks of labor is to retire, *i. e.*, to reduce his hours of labor to none at all.

Christianity has a very different conception to give to the world, and the Christian ministry are the men to give it. It depicts, in the prose poem with which the history of the race begins, an Eden which the innocent children of God were appointed to dress and to keep. In the primitive commonwealth, which was to serve as a pattern for future generations, war is discouraged, agriculture honored and ennobled. Abraham is a farmer; Moses, a herdsman; David, a shepherd boy; Paul, a tent-maker; Christ, a carpenter. In the glowing picture of the future golden age which awaits the world the spears are not laid aside, but beaten into pruning-hooks; nor the swords hung up ingloriously to rust away, but converted into plowshares. The benediction of God is bestowed on the laborer. The Hebrew painter takes his brush to paint a picture of

* De Tocqueville, "Democracy in America," Vol. I., p. 393.

ideal womanhood. This is what he places on his easel :

"She seeketh wool, and flax, and worketh willingly with her hands. She is like the merchants' ships; she bringeth her food from afar. She riseth also while it is yet night, and giveth meat to her household, and a portion to her maidens. She considereth a field, and buyeth it: with the fruit of her hands she planteth a vineyard. She girdeth her loins with strength, and strengtheneth her arms. She perceiveth that her merchandise is good: her candle goeth not out by night. She layeth her hands to the spindle, and her hands hold the distaff."

Which picture I beg permission to recommend to the thoughtful consideration of those who have in charge the higher education of women.

That is not the higher education for either man or woman which educates them away from honest industry, from hard work; which teaches the boy to shun the plow, or the girl to shun the spindle; which puts in either men or women an ambition to escape labor, not to perform it. What does the eight-hour movement mean? Does it mean two hours more for head, and heart, and home; for books, and wife, and children, and love? Does it mean less hand work, and more head work; less factory work, and more home work; fewer hours with the "boss," and more with the tired wife and neglected babes? Then all hail to it. An age in which seven men can gather from the willing earth food for one thousand ought to redeem humanity from drudgery—but not from toil. For if the eight-hour movement means merely less work—less in factory or at home, for "boss" or for children, of head or of hand, then it means more idleness, more drink, more wretchedness, more paupers.

III. What is the Christian conception of wealth?

The unchristian conception of wealth is expressed in the saying, "Is it not lawful for me to do what I will with mine own?" It finds its perfect illustration in the saying of the French Bourbon, "The State! I am the State." This was the mental attitude of all the Roman emperors. Rome was their private property—its citizens their cattle, its wealth their personal estate. The American Republic no longer believes this to be true. That public office is a public trust is professed by all Americans, even if it is believed only by a few. What is true of office is true of property. I criticise Henry George as not sufficiently radical. He objects to private property in land. He does not go far enough. The Bible objects to private property in anything. The doctrine that property is a trust is far more explicitly taught in the New Testament than the doctrine of a vicarious

atonement, or a Trinity in Unity. The latter are deductions from Biblical statements, the former is itself a Biblical statement. Property is a trust; life is a service; the poor are the beneficiaries; the duty of the trustee is to give them food in due season; the judgment is an accounting; the self-server is an unprofitable servant; the server of his age and race is a faithful and wise servant, who has proved his capacity for rulership. This is not figure; it is not Oriental imagery; it is not theological fiction; it is plain, simple, matter-of-fact, prosaic truth. The man who takes his property to be his own and uses it on himself is as truly guilty of embezzlement as the clerk who filches from his employer's till. No Bible student doubts this; but not many Bible preachers are accustomed to preach it, and fewer still of Bible Christians adopt and act upon it.

This truth is not more clearly announced by the Bible than it is by that other great revealer of spiritual truth—life. Our country is rich. What made it so? We have been digging coal and iron out of the Pennsylvania hills, and pumping oil out of its reservoirs; we have been gathering grain from the wheat-fields of Dakota, and cotton from the cotton-fields of Texas, and silver from the Rocky Mountains, and gold from the Pacific coast. Whose are they? Who stored them there? We are rich as the child is rich who discovers the preserves which his mother has put away in her closet; and, like the child, we shall pay dearly for our theft if we imagine that the treasure we have found is ours,—ours to do with as we please. It is His who put it there; and for our use of it or abuse of it we shall account to Him. It is a hopeful sign of American civilization that never before in the world's history were there so many men of wealth using their wealth as a trust, not as a private possession. I visited, not long since, one of the largest single coal-mine owners in Pennsylvania. He had built up in the wilderness a village with five thousand population. No roof covered more than two tenements; every tenement had about it ground for a garden plot. The day-school was kept open ten months in the year; evening schools afforded special facilities for such as wished to pursue special studies; a great hall furnished them with opportunity for every kind of recreation, from a ball to a lecture; a free library and reading-room gave an evening lounging-place free from beer and tobacco; there was not a liquor shop in the town; the ladies of the mansion equipped every year a Christmas-tree for the children of the village, dressing many out of the hundreds of dolls with their own hands; but what was best of all, the owner of mine, and land, and cottages

lived in the midst of his workingmen, and administered with his own hands the estate which furnished the one thousand workingmen with employment, the five thousand villagers with bread, and homes, and life. I thought how it would have delighted the heart of grim old Carlyle to have visited Drifton, and how even John Ruskin would have found something to praise in such a mining community.

I do not ask that men of wealth shall give more money to the Church, which is often stronger when it is poor than when it is rich; nor to the poor and thriftless, whom unearned money only keeps in poverty. I urge that the power to make money, like any other power, is a trust bestowed on the possessor for humanity. The preacher who preaches for his salary, not for the spiritual well-being of his parishioners, is a mercenary; the physician who practices for his fees, not to cure the sick, is a mercenary; the lawyer who pleads for his honorarium, not for justice, is a mercenary; the politician who enacts laws for what he can make, not for the community, is a mercenary; no less the manufacturer, the merchant, the trader, the man on 'change, who transacts his business to make money, not to give the community its meat in due season, is a mercenary. In the history of the nineteenth century, the doctrine that wealth is a trust must stand by the side of the doctrine that labor is an honor and liberty is an obedience. The materialism that threatens the American Church is not the materialism of Herbert Spencer. It is the materialism of the railroad, the factory, the shop; the materialism that puts thinghood above manhood; that does not know that things were made for man, not man for things—that God gives us, not Irishmen to build our railroads, but railroads to build Irishmen; not Hungarians to dig our mines, but mines to develop manhood in Hungarians.

These illustrations may serve at least to indicate the lines of investigation to which the needs of the nineteenth century invite the American preacher. If he will go to his Book for this purpose, he will find it quite as rich in sociological as in theological instruction; quite as fertile in its suggestions respecting the duty of man to man as in its suggestions re-

specting the nature and government of God. He will find his New Testament telling him that in Christ's kingdom the strong are to serve the weak; the rich, the poor—*i. e.*, the factory owner his hands, the railroad prince his trainmen; that controversies are to be settled, not by wage of battle or its modern equivalent, strikes and lockouts, but by mutual concessions and ultimate appeal to an impartial tribunal—in other words, by conciliation and arbitration; that the State is not a "social compact," nor government a "necessary evil"; that the one is a divinely constituted organism, and the other the necessary condition of its existence; that the judicial function does not belong to humanity, and therefore the judicial system will never become truly Christian till it ceases to be an effort to administer justice and becomes an effort to administer mercy; that the brotherhood of man is an integral part of Christianity no less than the fatherhood of God, and that to deny the one is no less infidel than to deny the other. In short, while he will find in the Book which he is appointed to interpret no light upon scientific details of political or industrial organization, he will find the great moral laws of the social order, if not clearly revealed at least definitely indicated, and in them abundant material for sermons which will be interesting because giving instruction which is both imperatively needed and eagerly desired. Sir Henry Maine has shown very clearly that democracy is not yet "triumphant democracy"; it is still an experiment. The American Revolution determined our right to try it on this continent without fear of foreign intervention; a civil war determined our right to try it without fear of domestic disruption. We have still to work the problem out. Whether a people diverse in race, religion, and industry can live happily and prosperously together, with no other law than the invisible law of right and wrong, and no other authority than the unarmed authority of conscience, is the question which America has to solve for the world. No one class in the community has a more potent influence in determining what shall be its answer to that question than the American clergy.

Lyman Abbott.

THE ONLY FOE.

WILD, threatening sky, white, raging sea,
Fierce wind that rends the rifted cloud,
Sets the new moon's sharp glitter free,
And thunders eastward, roaring loud!

A fury rides the autumn blast,
The hoary brine is torn and tossed;
Great Nature through her spaces vast
Casts her keen javelins of the frost.

Her hand that in the summer days
Soothed us with tender touch of joy,
Deals death upon her wintry ways;
Whom she caressed she would destroy.

Life shrinks and hides; all creatures cower
While her tremendous bolts are hurled,
That strike with blind, insensate power
The mighty shoulder of the world.

Be still, my soul, thou hast no part
In her black moods of hate and fear;
Lifted above her wrath thou art,
On thy still heights, serene and clear.

Remember this,—not all the wild,
Huge, untamed elements have force
To reach thee, though the seas were piled
In weltering mountains on thy course.

Only thyself thyself can harm.
Forget it not! And full of peace,
As if the south wind whispered warm,
Wait thou till storm and tumult cease.

Celia Thaxter.

GEORGE KENNAN.

WELL-KNOWN literary man who met Mr. Kennan on his return from Siberia declared, "I have been talking with a man who has seen hell!" It is not strange that the world is curious about one whose experiences can be thus graphically described. We wish further knowledge of the personality of him who has traversed the awful circles and himself tasted the fire. Indeed, he who tells us such tales may justly be asked for an account of himself. Sober second-thought has a right to learn the quality of the man who describes inconceivable horrors as actual, living facts. There is reason in seeking to know the experience which gives value to the judgment of one who, standing on the basis of his own statements alone, asks the world to believe the incredible, and relates that which must from its very nature be unverifiable.

It may well enough be that not only to the readers of this magazine, but to all the world as well, Mr. Kennan's history is centered around the expedition of 1885 to study the exile system. His career up to that time was but a preparation for that high service; his mental equipment, his physical traits, his characteristics and qualities are of value as they show his power to do this work. The very facts of his life take on new importance as educators for it, or slip away unnoticed as out of relation to it. Large and small become relative

terms in this view of things, and especially do some minor events take on a new interest. It is said that the hour brings the man: never was a truer instance of it than this work and this worker; never does a whole previous life seem more entirely a preparation for such work. Keen, quick, discriminating, yet especially just and accurate, strong in body and with a stout purpose, of an unconquerable will and an indomitable courage, and with an eager interest in all strange places and peoples, Nature had made him for her service. Nursed on difficulties, and trained by necessity, he yet had never parted company with industry and perseverance, while readiness of resource was both his inheritance and his habit. Books and life had equally been his tutors; he had learned to write readily, to collocate, and to compare. Business, law, and government had given him knowledge. The difficult speech of Russia was his familiar tongue, and a strange and sharp special training had made this far country like another home to him. Surely here was the man, and the hour also had come, for the world was waking to the faint cries of the oppressed and asking for the truth.

Born in Norwalk, Ohio, on the 16th of February, 1845, canny Scotch and impetuous Irish blood mingle with the sturdy English currents in the veins of George Kennan; but for four generations the Kennans have been Americans. His father, John Kennan, a young

lawyer from western New York, had found home and wife in what was then a small town of Ohio. His mother was Mary Ann Morse, daughter of a Connecticut clergyman, and it is not without interest to learn that she was of the same family as the great inventor of telegraphy, S. F. B. Morse. It may have been but a coincidence, but it may have been some subtle influence of heredity that determined the trend of life for the boy who sent his first message over the wires the day he was six years old, and who from that time onward found in their constant use both vocation and avocation. It is also curious to notice a passionate love of travel in the father, and a deep devotion to nature, and an unusual mechanical skill — qualities, all of them, which repeat themselves in the son, this last developed into an extraordinary quickness at supplying unexpected needs and a wonderful readiness of adaptation, whether in things physical or in more important matters. From his mother too came strong mental and moral impulses, making him a quick observer and a stern judge of life; and from her came the intellectual ability and love of literature so noticeable in the boy who would have an education at whatever cost, and so conspicuous in the cultivation of the man.

The coveted "education" was no light matter to this seeker after knowledge, as appears by the price he willingly paid for the hope. A college course was the goal at which he aimed, if indeed that can be called a goal which is intended only as a sort of landing-place in an upward way already planned. But it was one thing to plan and another to accomplish the end. Circumstances that could neither be helped nor hindered laid upon the shoulders of this boy the duty of assisting in the support of the family, and at the somewhat tender age of twelve George Kennan began that life as a telegraphist which prevented any further regular school-going, but which, with equal pace, led the way to a very different career. Courage and endurance and industry were not the least of the qualities that were at once exhibited and educated in the struggle of the years that followed. It has already been said that he became a regular operator at Norwalk at the age of twelve. For the next five years, not only there but at Wheeling, Columbus, and Cincinnati,—for thoroughness and skill brought rapid promotion,—he never ceased both study and recitation, whether it was 3 or 4 o'clock of the night when he laid down his work. It was at Cincinnati, in the latter part of 1863, that he finally gave up the hard-fought battle; and from that time on there was no more school for Kennan, and of the plan of a collegiate course only the unconquerable

desire remained. It was now in the midst of our civil war, and the extreme pressure of work at this important junction of lines, added to the unremitting mental and physical strain of double duties, had well-nigh broken down a constitution not used to give way. Pursued, however, by the failure of life-long hopes and seemingly hemmed in by an inexorable future, the young man fell into much despondence. He was filled with the patriotic fervor of the time too, and the spirit of adventure had already taken hold of him so that he left no stone unturned to procure an appointment as telegraph operator in the field, and, failing in this, besieged the authorities for other difficult service.

It was perhaps as much because wearied with importunities as on account of old family friendship, that General Anson Stager, then Superintendent of the Western Union Telegraph Company, at last acceded to his request for a place in the Russian-American telegraph expedition. That brilliant scheme has been so long forgotten that it may not be amiss to remind the reader what it was, the more especially as its work had a determining influence upon young Kennan's whole future. The failure of the first Atlantic cable made it seem for a time as if no such medium of inter-continental communication could be accomplished. In this emergency the Western Union Telegraph Company saw a possibility of a land route through British Columbia and Alaska on the one side, and over the vast barren spaces of Siberia on the other, with the short and quite possible cable across Behring's Straits to connect the two. Work was actually begun upon the line, but the success of the second Atlantic cable put an end to the overland experiment midway in its career. While it was still a plan however, the restless and gloomy youth in Cincinnati, sitting one day at his place in the office, thinking hopelessly of his appeal to General Stager, suddenly jumped into life at the receipt of a laconic message sent over the wires by that gentleman's own hand, "Can you start for Alaska in two weeks?" and with the confident courage alike of his age and his temperament replied, "Yes, in two hours!" This eager candidate for hardships was still to undergo six baffling weeks of desperate fever and many months of rough life and adventure in Central America and California before the expedition actually left for eastern Asia on July 3, 1865. Scarcely twenty years old, there were eight years of work behind him in which unwearied industry and much professional ability had already been evidenced and appreciated,—years in which the burdens of life had fallen somewhat heavily upon shoulders eager for other tasks,—but as

the ship sailed out of the harbor of San Francisco and he turned his face to Kamtchatka, the very golden gate of promise opened before him.

The two years spent in the wilds of eastern Siberia, with its camps on the boundless steppes, its life in the smoky huts of the wandering Koraks, its arctic winters, its multiplied hardships, and its manifold interests and excitements, proved a very preparatory school for another and vastly more important Siberian journey. Not the least of its advantages was the knowledge of the language then first acquired in those months of often solitary life among the wild tribes of Siberia. Among this man's many qualifications for his work is an unusual linguistic ability. Not only is a language very easy to him, but almost without his own knowledge he possesses himself of a certain inner sense of its use, and a facility at its idiom. He has been called among the first — if not, indeed, the best — of Russian scholars in America. However this may be, a strong sense of the genius of the language is his to that degree that those fortunate friends who have been introduced by him to some of the leading Russian novelists are sometimes heard to express the wish that he would give over more important work and take to translating. It goes without saying that his acquaintance with Korak and Caucasian, Georgian and Kamtchatkan, wild Cossack and well-to-do citizen, nihilist and soldier, has given him a range of speech seldom possessed in a foreign tongue by any one man, and obviously of inestimable value in the difficult work before him. Certainly no other Russian traveler can equal him in this indispensable adjunct to investigation. Mr. Kennan's brilliant story of these strange months of work and travel for the telegraph company is too well known to require any retelling of its experiences, but it is only between the lines that we get knowledge of the physical endurance, the unbounded resource, the nerve, the skill that made the result possible, the high spirits and buoyant temperament that filled with gayety the most tedious days, and upheld the little party of three or the lone worker in the most appalling surroundings. Nothing was impossible to the man who so successfully made that journey and did that work. It is well to remember also that this was the first great opportunity for adventure which had opened before one whose scanty boyhood was spent over travelers' tales, whose favorite study was geography, and whose very babyhood laid out his blocks into towns and cities, among which his toy ships sailed their complicated voyages. Long horseback rides through beautiful scenery never yet spread out before civilized eyes; adventurous journeys and

hair-breadth escapes from snow and seas; life in sumptuous homes, or frozen tents, or dirty huts, as fortune chanced; tedious and enforced idleness, or hard and responsible labor — all this filled up the long days that were in some sort double days, divided only by the twilight of the arctic night. This was indeed the taste of blood to the lion's cub, and life seemed made for travel. All too soon the brief experiment ended; but our young telegrapher was a full-fledged traveler now, and much too loath to go home again for any haste. A whole winter he spent in St. Petersburg, clinging to a thread of chance that the telegraph project might be revived; but he was by no means unemployed, as always and everywhere he was watching, observing, studying; while the quick, eager glance, the extraordinary perception of detail, and the equally quick recognition of under-currents and the reasons of things, served him as well among the varied elements of the Russian capital as it had done among the fierce savages of the provinces. It was to be expected that so friendly a man would make many Russian friends; and it was equally a matter of course that so close an observer would learn much of Russian habits, and still more of Russian life. All unconsciously to himself he was laying broad and deep the foundations of his life work, and preparing the way for an unparalleled undertaking as brave and heroic as any deed of knight or warrior, and far-reaching in its results beyond any knowledge of his or ours.

Both the work of the telegraph company, and the overland journey from Kamtchatka to St. Petersburg, had given him much knowledge of the people, and he had frequently turned aside to explore the prisons. Thus it was that when he came home in the spring of 1868, his portfolio was full of material for lectures and magazine articles, all of which he meant should furnish him the sinews of travel for a certain journey into the Caucasus. It was then that Kennan first appeared in print. With the exception of a few private letters printed during his absence in the local newspapers, his first work as a writer was an article in "Putnam's Magazine" for that year, called "Tent Life with the Wandering Koraks," and this and the series which followed it were shortly after expanded into the book already referred to, "Tent Life in Siberia" being published in 1870. The story of the lecturing experience is eminently characteristic both of the temper of the man and of his mental habit. Lectures to crowded halls alternated with audiences of a round dozen. To great cities and little hamlets, to church societies and female seminaries and dignified assemblies, wherever he could find place, he offered his strange tales of an unknown land. It was still the palmy time of the lyceum lec-

ture, and well he improved his opportunity. If failure were his portion on one night, he made it the entering wedge of success the next. Full of industry, courage, philosophy, above all possessed by the determination not to fail, come what would, he laid siege to success. The literary skill evinced, considerable as it was, was the least of the qualities brought out in this little *entr'acte* of his life. Most of all it exhibited those elements of character which later held firm in the tremendous strain put upon his whole being by this explorer of human life and death. It is almost unnecessary to mention that the money was secured and the trip to the Caucasus enjoyed. The fall and winter of 1870 were spent in a solitary horseback journey through Daghestan. It was then that occurred that famous ride down the face of a precipice, a feat rarely performed by mortal man, and made a test of courage by a fierce Georgian nobleman; it was in the strange country beyond the mountains that he became the companion of gypsies, and made one of a merry group of peasants greeting their governor with feasts and games; it was here that he saw the wild horsemanship that makes the glory of those remote regions, and learned for himself anew to fear nothing and to be a brother to all. The whole tour was full of the wildest adventure, testing the physical courage of the man almost beyond belief, abundantly proving once more his extraordinary ability to adapt himself to the most adverse conditions, to render the least promising environment tributary to his ends, and showing his remarkable power of bending men as well as things to his purpose, and his success at winning their confidence, whether in palace or hut. A single ride across the mountains gives him a prince for a companion, a single night around the camp-fire makes the wildest Tartar his friend.

It is pertinent to speak particularly of these journeys, since they give the answer to the question as to what knowledge Mr. Kennan possesses as a basis of judgment on Russian affairs; but the next few years of his life, although spent in less exciting pursuits, have perhaps no less bearing upon his ability to judge correctly of men and things. He was now a hardened traveler, an accomplished Russian scholar, and possessed of wide and varied experience of that strange and many-peopled empire, but he knew little — almost nothing since his busy boyhood — of life in its normal conditions. It was therefore of the utmost value to his after-work that on his return to this country he engaged in various apparently irrelevant occupations, although these attempts were in no sense intended to be life pursuits. The boy had dedicated himself to travel and literature, and the man would fulfill the vow, but there

were other considerations to be taken into account — there was a *meanwhile* to be undergone. One of these temporary undertakings was in the law department of the Mutual Life Insurance Company in New York City, and this resulted eventually in an engagement by the Associated Press to report the decisions of the Supreme Court at Washington. Thus there came to him a certain acquaintance with the law; and in a seven-years' life in Washington he learned much of government, its duties and functions. As editor for the Southern States, and afterward for some years as "night manager," of the Associated Press in that city, the man — as did the boy — worked all night and came home to work all day, for even this busy profession was not enough for his superabundant energies. His passion "far countries for to see," to which a human interest had now been added, was by no means satisfied. Many plans of many kinds occupied his mind, one of the more important being a well-grounded scheme for the rescue of the *Jeannette* expedition. It is enough to say of this that Commander Goringe offered to sacrifice his Egyptian collection, if need be, to furnish the funds for it. Kennan also gave much thought and work to the efforts for the relief of Lieutenant Greely. But all the time his chief desire, the end he wished eventually to attain, was another journey to Russia to study the exiles, and this he was always trying to bring about. That small portion of his time not occupied by his regular work he filled full of other labor, leaving his pen no more time to rust out than his body; and in the constant stream of articles he put forth and the lectures he delivered — including an extremely successful course of "Lowell Institute lectures" at Boston — he invariably spoke of the exile system in the most kindly manner. As he himself has told us in his preface to the Siberian papers, all his prepossessions were in favor of the government as against the revolutionists, and so again he unwittingly paved the way for the journey he was to make, and rendered possible the tour which was to be so full of horrors and yet so valuable to mankind. Various reasons moved him to this desire. Mr. Kennan is a great lover of accuracy, and time and trouble count for nothing with him until he is sure of all his statements, even in those minor particulars which sometimes seem immaterial. Therefore he wished to verify more completely certain assertions he believed accurate, but which had been fiercely disputed, and to see with his own eyes further details of a life with which he thought himself very familiar; and, whether the result should agree with his accepted views or not, he was entirely ready to meet it. Yet feeling,

as he did at this time, that the Russian administration was much traduced and misrepresented, his strong sense of justice and fair play led him to take every occasion to dispute this position from the basis of personal knowledge. He was always and everywhere, both publicly and in private, a sincere defender of the Czar's government, insisting upon his own acquaintance with the facts to the entire confusion of his opponents for the most part. The writer of this remembers certain private encounters of such a nature, and his vigorous, energetic, even combative, and altogether unconquerable advocacy of the lenient treatment of political prisoners by Russia, mingled with a sort of contempt for the nihilists, and a rooted belief that the public was altogether deceived by false statements, both as to their character and condition. However, since his facts were questioned, he became yet more determined to see again for himself and more thoroughly this Siberia, that he might know still more certainly of what he spake, and answer altogether both his own questions and those of his opponents. He would retrace his steps that he might verify his words. Either he would recede from his well-known position, or he would, once and forever, put an end to these complaints against a great government. Notwithstanding all his efforts, however, public events and personal affairs held him in the United States for some time longer. But already *THE CENTURY* had determined to be sponsor for this great undertaking, and after two short preparatory trips to Europe, Mr. Kennan sailed from New York on the 2d of May, 1885, sent out by that magazine, and with him went a skillful artist, Mr. George A. Frost, to supplement his work. At last he had entered upon the service he had so long dreamed of, and for which so many experiences had unconsciously prepared him. Just half his life had been given to Russia, either in travel or in thought, and the years spent in America had been no less valuable to his equipment than the others. Again he sailed away from our shores as he had done twenty years before, on a voyage of discovery, full of exultant hope. From this journey he returned in August, 1886, and it may safely be presumed that he will not go to Russia again!

With this last trip all the world will shortly be familiar from his own graphic account of the terrible journey. Let us hope that he will not fail to show how much his success was the result of his personality, his knowledge, ability, and genius for his work. His own feeling about it was epitomized in a private letter written soon after his return. He says:

My last trip to Siberia was the very hardest and at the same time the most interesting of my whole life. I would not have believed two years ago, that at my age and after my tolerably varied and extended experience of life, there were yet in store for me so many strong, fresh, horizon-breaking sensations. I do not mean that I regarded myself as an extinct volcano of emotion, or anything of that kind,—my emotions never were volcanic,—but I believed that I had already experienced the strongest sensations of human existence, and that I could never again be as deeply moved as I had been in the early years of manhood, when the whole world was strange, fresh, and exciting. But it was a mistake. What I saw and learned in Siberia stirred me to the very depths of my soul—opened to me a new world of human experience, and raised, in some respects, all my moral standards. I made the intimate acquaintance of characters as truly heroic in mold—characters of as high a type—as any outlined in history, and saw them showing courage, fortitude, self-sacrifice, and devotion to an ideal beyond anything of which I could believe myself capable. It is about some of these characters—some of the people we call “nihilists”—that I wish to talk to you. I can reflect to you only a small part of the influence they exerted upon me, but I can at least explain to you how it happened that I went to Siberia, regarding the political exiles as a lot of mentally unbalanced fanatics, bomb-throwers, and assassins, and how, when I came away from Siberia, I kissed those same men good-bye with my arms around them and my eyes full of tears. You will, I am sure, understand that it was no ordinary experience which brought about such a revolution as that.

In 1879 Mr. Kennan married Emeline Rathbone Weld, the daughter of a prominent citizen of Medina, N. Y., and brought her to Washington. Of this part of his life it is enough to quote the words of a close friend: “The side of his nature displayed in his home relations is of the most tender and charming character—indeed, the home life is ideal.”

Mr. Kennan is of slight physique, somewhat delicate in appearance,—so thin, so white, so dark is he,—but possessed of great powers of endurance, especially in the capacity to bear strain. Lithe and active, his nervous energy is intense, and a considerable muscular development enables him to perform feats, both of action and of endurance, apparently quite beyond his strength. Siberia and the Caucasus alike assent to this, and many times he has proved its truth in less conspicuous places. A buoyant and sanguine temperament is joined to a wonderful recuperative power physically; these things and a sound body enable him to recover at once from the awful strain he so frequently and lightly puts upon himself, and allow him to play with hardship like an athlete in a race. The man who meets him for the first time is struck with his hearty, reassuring manner, his cordial hand-grasp, his steady, square, and penetrating look, his ease and readiness of speech. An erect and active habit of body goes along with an alertness of mind; but just as his steps are both sure and quick, so is decision joined to the ready mind, and with them is a certain

soberness of judgment. Enthusiastic and romantic, his sympathies are quick and tender. But although a certain frank disclosure of himself awaits any friendly seeking, he is a man of reserved nature, and his confidence is difficult to reach. It may indeed be objected that some of these qualities are contradictory; be that as it may, they each and all appear and reappear in this man in quick succession. His affections are particularly deep and strong, and he holds his friends by a firm grasp, even unto death, through good and evil report. Much might be said of his friendships—not only of the devotion he gives, but of that which he receives. A curiously strong magnetic power draws men to him. His friends know no bounds to their admiration, and they love him like a woman.

Mr. Kennan's peculiar buoyancy of temperament appears in his spirits, which reach both the heights and the depths. In his happy hours of a joyous temper,—almost frolicsome in those rare moments when work is forgotten,—fond of story-telling, a wit, and in particular a good talker, he is a much-sought companion for the lighter hours of life: a diligent student of men and affairs, with a quick perception and a steady grasp of a subject, based on unusual experience, he is equally ready for the more serious discussion of causes or events. At work again, he is altogether at work. Few men are so entirely and strenuously at work as he. It is laughingly said, albeit with something of truth, that he will spend hours over a statement and take a whole day to verify a fact. He produces his results with the greatest care and by the most painstaking methods. There is constant physical and mental strain, and even a temporary cessation of actual labor brings no relief from tension until the work is done, when, the pressure off, it is altogether off. At play, pleasure, or work, thoroughness and entire absorption is the note of his life. Says the friend already quoted:

When he is off duty and on a holiday, there never is a more genial, lively, quick-witted, merry fellow than he. His appreciation of fun is great, and he not only enjoys it, but is willing to bear a goodly share in the frolic. He is apt with a good story, and very responsive to wit and humor. No one ever presented two so totally different phases as he. When he is in the midst of the winter's work, when every minute is precious, he is as silent and pre-occupied as an oarsman in an inter-collegiate race. The pressure is so constant, and the breathing spells so rare, that, when they come, there is but little inclination for anything but the breathing. There is no sparkle, no liveliness, only that intense concentration and painful pre-occupation. It is mental travail of the most distressing kind.

Mr. Kennan has a deep and abiding love of Nature, a careful and affectionate regard for her beautiful things—her clouds and flowers,

her mountains and sea. A lover of music, he is possessed of a quick ear and is not without a working knowledge of the art. A man of wide reading and of fine intellectual tastes, always given free rein, he has not only much acquaintance with general literature, but some particular lines of reading he has pursued with the thoroughness which characterizes all that he does. It is obvious that this is true in regard to Russian affairs, for only a constant reader of both periodical and standard literature in that language could so keep abreast of the life and thought of a foreign country. His books are well read, and the wide range of subjects they embrace is no less noticeable than the fullness of certain departments. One might almost trace his mental development in these books, but surer ground would be found in the complete card index which marks the steps of all his reading and thinking. Nothing makes greater impression of the thoroughness and accuracy of the man, and of his equipment for his work.

George Kennan's mental and physical characteristics peculiarly fit him for the task of observation, while the qualities of his character give especial value to his judgment of facts. Great physical courage, partly temperamental and partly the result of character, combined with a natural confidence in his own power, break before him the most impassable barriers. A phenomenal readiness at expedients furnishes him with a device in every most desperate situation. To these he adds the peculiar facility of adaptation to strange peoples, and the great talent for languages already alluded to. Fortunately he has the scientific habit of mind to a marked degree, and, be the occasion large or small, he sees and sets down the minutest particulars of his surroundings. Details are both noted and recorded. He does not so much select salient points as put down *all* he sees. If for this reason he sometimes fails to give due proportion to matters and events, he believes it his business to give you the facts—you may draw your own conclusions. This is not to say that he draws no conclusions of his own. Quite the contrary. He is a man of much thought and has thought well on many things. Probably the first impression he would make upon a stranger would be that of balanced judgment, and this certainly is the expression of long acquaintance. Just and fair, a man who sees all things and who weighs well both sides of a matter, his final conclusion may safely be trusted.

Equally striking is his tremendous will power, ever pushing him on to success. To this there seems to be no limit. He has a feeling of pleasure in overcoming obstacles, he loves a difficulty, he delights to match his

powers against opposition; as he himself expresses it, he has a certain pride and pleasure in doing, by the sheer force of his own manhood, something which all nature conspires to prevent. In every direction his standards are exacting. His ideals are fine and high. Purity, sincerity, honesty, truth, and honor are dear to him. Character is the sharp test he puts to himself and other men, and on that standpoint alone he finds common ground with those about him. To him the purpose of life is an ever-heeded question, and its best use a never-forgotten aim. Life means much to him, and constantly more and more. Being asked on one occasion what end he proposed to himself when as a boy he sought so eagerly for a wider field, he answered somewhat after this fashion: "I wanted a full life, a life in which all one's self is satisfied. My idea of life was one into which were crowded as much of sensation and experience as possible. It seemed to me that if I should grow old and

miss any of the sensations and experiences I might have had, it would be a source of great unhappiness and regret to me." Mr. Kennan has not grown old, but he has already tasted more sensations and experiences than most men, and these experiences have wrought upon him until he wishes more than to feel them for himself—he would make them factors in the world's progress. He has put his life in jeopardy every hour, and he would make that risk the price of hope for the prisoners of despair. He has come home to cry aloud, that we who think ourselves too tender to listen to the story of such suffering may feel and see the horror and the glory of it. He is no longer content to tell the traveler's tale; but to-day, and to-morrow, and until the deed is done, he must needs strive to open the blinded eyes of History, and help her to loose the chains that bind a whole people.

TOPICS OF THE TIME.

An Administrative Novelty.

WHAT is the remedy for the lawlessness of law-officers? Who will keep the keepers? The fact is notorious that, all over the land, plain statutes are disregarded by those who are plainly bidden to enforce them; that sheriffs and constables and policemen stand and look on while the laws which they have sworn to execute are dishonored before their faces. This is the feature of our political administration that is most troublesome and discouraging. That evil and desperate men may be found among us, who, for selfish purposes, are ready to defy the laws, is not marvelous; that the men who are intrusted with the execution of law should, in so many instances, appear to be in league with the law-breakers, guaranteeing them immunity in their transgressions, is certainly alarming.

This is more particularly true with respect to the laws which restrain liquor selling. It has come to be the settled policy of the dealers in strong drink to resist all laws which interfere with their business. Not unfrequently, in organized bodies, they vote to disobey the laws of the State. Such action is, of course, the essence of anarchy. It would seem that the custodians of law should resent conduct of this kind as especially

insulting to them, and that they should be ready to try conclusions with those who thus defy them. But in many cases we find the police authorities ignoring this challenge, and apparently taking their orders, not from the statutes, but from the anarchical groups who have assumed the power to annul the statutes. This spectacle is more familiar than it ought to be. The complete paralysis of the police force of many cities, in presence of certain vicious classes, is a lamentable sign.

It is sometimes said that this is due to a failure of public sentiment; that if the people were determined to have the laws enforced, they would be enforced. But this is not altogether just. Often the police department is so organized that the people cannot bring the power of public opinion to bear upon it in any effective way. It is under the control of commissioners who are not elected by the people, or who are elected for such terms that it may require several years to bring in a majority of trustworthy men. And it must be admitted that it is difficult to keep the popular attention fixed on a question of this nature, and the popular indignation up to boiling-point, for three or four years at a stretch. This is one reason why municipal reform often goes forward so haltingly. If the executive departments of the city are so organized that it will take several years

to change the administration, inefficiency and rascality are pretty likely to intrench themselves, and to make themselves secure against dislodgment. The popular wrath may be hot for one campaign, but it is pretty sure to cool off before the next. This is one reason why a centralized government, like that of Brooklyn, is to be desired; it brings the people into direct and frequent communication with the sources of administrative power, and enables them summarily to remove dishonest and inefficient officers. If public opinion is the effective force of popular government, then our governmental machinery should be so contrived that public opinion can act promptly and directly upon the administration. It is a curious fact that many of our legislative devices, for the last twenty-five years, have been intended to prevent any direct and efficacious application of the popular will to the problems of government. It seems to have been supposed that those forms of administration are safest which put the offices that are the final depositories of power at the farthest possible remove from the hands of the people. It is needless to say that this practice evinces a total lack of faith in democracy. Indeed, we might almost say that the democratic principle has been ignored in our municipal systems; and might fairly apply to democracy what was pertinently said of Christianity,—that it could not be truthfully pronounced a failure, because it had never been tried. Thus it is often true that the failure of the police authorities to enforce a law is not due to the lack of a public sentiment demanding the enforcement of the law, but is rather due to those legislative contrivances which prevent public opinion from acting directly and efficiently upon the custodians of the law.

It must be remembered also that the courts, as well as the police, are the custodians of the law. The police authorities can do nothing unless the courts and the juries support them. In Brooklyn, during Mayor Low's term of office, a body of clergymen, headed by Mr. Beecher, called upon him to inquire why the excise laws were not more faithfully executed. The mayor drew the attention of his visitors to the fact that the courts were the ultimate enforcers of law, and that the courts utterly failed to coöperate with the police in giving vigor to the law. The police under his administration had arrested one saloon-keeper five times for selling without a license, and the total amount of fines imposed upon him by the court amounted to less than the cost of a license. A barkeeper also had been acquitted by a jury for selling without license, on the ground that he had tried to get a license, but had been refused by the excise board! It is evident that good executive officers will not be very zealous in the enforcement of laws if the courts give them this kind of backing. And it is very clear, in the words of Mayor Low, that "public sentiment to enforce law must express itself through the jury-box and from the bench just as efficiently as through the executive, or the desired result cannot be reached."

It sometimes happens, however, that public sentiment expresses itself through the judiciary more directly and efficiently than through the executive; and a curious incident of recent history shows how the courts may be used to spur to action a derelict administration. In one of the cities of Ohio, the law requiring the closing of the saloons on Sunday had been fla-

grantly disobeyed for years, and the police authorities, who were commanded by the law to see to its enforcement, had never lifted a finger to restrain the transgressors. At length application was made by citizens to one of the judges of the Court of Common Pleas for a writ of mandamus, requiring the police commissioners to execute the law. The case was argued, the fact of the entire inaction of the authorities was shown—could not, indeed, be disputed; and the judge promptly issued the writ, commanding these officers to perform their duty. The commissioners met and consulted. "Suppose we refuse," they said; "what then?" "That will be contempt of court," replied the city solicitor. The jail already contained one or two inmates whom the judge had recently punished for contempt, and the prospect was not alluring. "I move," said one of the commissioners, after a solemn pause, "that orders be issued to the men to enforce the law strictly next Sunday." The motion was unanimously carried, and on the next Sunday, for the first time in fifteen years, every saloon was closed.

The question thus raised, as to whether the courts can exercise supervisory power over executive officers in the execution of criminal laws, is certainly an interesting one. Many legal gentlemen would have said beforehand that the thing could not be done. There may be those, even now, who will insist that the thing is impossible. But the answer of the saloon-keepers to this assertion must be the same as that of Mr. Lowell's philosopher, who, while in durance vile, recited the story of his incarceration to his lawyer; and, on being told, with some confidence, "They can't put you in jail on a charge like that," calmly answered, "They hev."

To what extent the writ of mandamus can be used in compelling negligent police authorities to enforce the criminal laws is a question into which a layman may be excused from entering. But the suggestion thus presented is worth considering by all who find themselves confronted with laxity in this department of municipal government.

Modern Science in its Relations to Pain.

ONE of the most frequent criticisms of modern science and its methods is derived from its asserted indifference to the more tender and spiritual side of man; and the more embittered critics have even said or implied that this indifference has already passed beyond the materialistic into the brutal. Napoleon long ago struck the key-note for this whole line of criticism when he said that surgeons did not believe in the soul because they could not find it with lancet and probe. And in all the discussions of vivisection the specific charges of cruelty against the professors have evidently been only a phase of the general suspicion of materialistic tendencies in their profession.

The commonest answer, from scientific men and others, has been that the change in methods of investigation which has brought to human knowledge and use the powers of ether, chloroform, cocaine, and other agents for the suspension of pain or consciousness during surgical operations has a fair right to expect a kindly consideration for its present work. Not many changes in modern life are more striking than the contrast between the past and the present of surgery. The surgical patient of former times was strapped

down to the operating-table, that no flinching on his part might disturb the accuracy of the operator's work. His open and conscious eyes watched the preparations and the actual operation either with a nervous terror or with a bullying affectation of indifference; and his after-life carried in it always the hardened cicatrix of such a memory as no one in the present need know. Is modern science to have no credit for its removal of so vast a mass of absolute agony from the life of man? The poorest laborer of the present may face with equanimity and safety operations from which the most powerful monarch of earth, a half-century ago, could expect only exquisite torture of mind and body, with perhaps impending peril to his life. And it seems but a fair proposition that the results of scientific methods in the past should give reason for expectations of even higher good to mankind from similar investigations in the future.

All this, however, it may be said, is but an incidental and unintended benefit to individuals, and no real part in the development of humanity. An accidental discovery of utility in the past is no good ground for hope of similar accidents in the future. Scientific men are not to gain plenary permission to indulge their taste for cutting and carving flesh merely because the wit of a surgeon or the boldness of a dentist, fifty years since, found that the power of ether to suspend consciousness might be put to use in surgery. The point of the discussion is thus transferred to that wider field on which, after all, the methods of modern investigation must stand or fall. Is "accidental" a term which is fairly descriptive of such discoveries as have been indicated? Or are the methods of modern science such as to promise the widest good for humanity in spite of incidental features which are apt to shock an unaccustomed mind? If the incidental benefit to individuals is to be stricken out of the account, ought not the incidental injury to individuals to go with it? Nor is the transfer any real misfortune to the object of the criticism; the influence of scientific investigation upon the world rather than upon the individual is its best title to existence.

One cannot study the history of his own times very far before becoming conscious that a decided point of difference between our generation and any former period, between what we call civilized peoples and the rest of the world, is in the comparative feeling in regard to pain. The modern civilized man is squeamish about pain to a degree which would have seemed effeminate or worse to his great-grandfather, or to the contemporary barbarian. His squeamishness is not egoistic; he does not seem to be any more afraid of being hurt than his great-grandfather was if he can see any good reason for it. The German soldier, while the mitrailleuse was still a weapon of unknown and frightful possibilities, cursed the Frenchman and charged up the hill face to face with the "hell-machines" as undauntedly as ever his forefathers faced simple bullet or bow and arrows. The nameless railway engineers, who stand to their posts into the heart of a great accident rather than desert a train-load of passengers, face and defy possibilities of pain such as the great Julius or Ney never dreamed of. Is there a finer thing in Plutarch than was seen when the English battalion, presenting arms to the helpless beings in the departing boats, went down in perfect

parade order on the deck of the foundering troop-ship? Modern life is rich in a supremacy over personal suffering which takes a higher character only as the finer organization of the human being comes to know more exactly in advance the nature of the pain which it is to face.

It is rather in others and for others that the modern civilized man dreads pain. He finds it harder to know that other men are suffering the pains of cold or hunger in Kansas or Ireland or India; or that "prisoners of poverty" are working for pittance in the great cities; or that laboring men are driven to work sixteen hours a day; or that criminals are tortured or mistreated in the chain-gang; or that "politicals" are driven to insanity in the Russian state-prisons. He resents and panishes cruelty to animals where his great-grandfather, perhaps, thought nothing of sending a slave to the whipping-post. He revolts even against harshness in just punishment, and desires to alleviate some of the horrors of hanging. If he ignores a case of cruelty, it is from lack of omniscience: let him know about it, and the world shall know his feelings about it. Wilberforce and Copley might go on for years telling Englishmen of the horrors of the middle passage and of all the villainies of the slave-trade: and still the slave-ships sailed out from Liverpool, and the slave-trade was represented in Parliament. Cruelty in more recent times lives by stealth and blushes to find itself famous in the newspaper pillory.

It is in its relations to this general development of humanity, and not in any alleviation of individual suffering, that modern scientific investigation may found its strongest claims to consideration. It should not be easy to deny that there are such relations. When the growing sensitiveness to suffering in others and the full admission of the methods of modern science are found in exactly the same peoples, in the same periods, and to the same degree, the connection between the two ought not to be doubtful. The modern civilized man is no longer made dull and callous by the frequent recurrence of human suffering in those forms which science can reach; and when it comes in any form, it makes a far deeper impression upon him. If Davy, by inventing the safety lamp, decreases the chances of colliery accidents, he gives all men a deeper horror when a hundred or more human beings are locked up in a burning mine or choked to death by damp. Ocean travel is made safer every year by increasingly ingenious inventions; but the diminution of wrecks serves to make the event far more startling when fire or fog succeeds in snatching its victim from among the great ocean steamers. Surgical progress, particularly in anaesthetics, by removing a vast amount of pain from the familiar acquaintance of the people, must have had a very great influence in intensifying their susceptibility to suffering in others, when it comes to their knowledge. But surgical progress, after all, is but one phase of a far larger system: every invention leading to a decrease in the amount of danger and suffering in human existence, all due to the methods of investigation introduced by modern science, has acted in the same direction and has produced similar effects.

The surgeon's knife follows unerringly the lines of muscle and tendon; and we are apt to think that its accuracy is due to a cold heart as well as to a cool head and a skillful hand. But the operator's work has direct

though unseen relations to the forces which have added Christian and Sanitary Commissions to warfare, which have mitigated the horrors of prison and asylum life, and which have sided with the weak and helpless all over the world. Money or fame or sheer love of research may seem to be the motive forces of the scientific investigation that is at work all around us; but through it all we should learn to recognize a still higher power preparing a still kindlier heart for the coming humanity.

Socialism and the "Trusts."

THE phenomenon which has most startled the country, since the sudden rise of the Knights of Labor, is the appearance of what are known as "trusts." We had known corporations, and had recognized the mode in which, by their concentrated competition with one another, they gave to the general public the results of the steady improvements in methods and amount of production, in the shape of better quality of goods and lower prices. We had even known "pools," arrangements between corporations to limit or cease competition, which was becoming destructive: many objected to them as enemies of competition; others defended them as the inevitable result of conditions under which the possibility of combination proved the impossibility of competition. The question of the guilt or innocence of "pools" must still be regarded as largely an open question; and before we have time to settle it, we are confronted by the still more serious question of the "trusts."

Corporations are the usual component units of the trust, as of the pool; and the authorized defense of the former rests on the general notion that the successive appearances of these forms of combination — corporations, pools, and trusts — are only successive steps in the evolution of new and more highly specialized modes of capital, necessary to meet new modes of production or new conditions of the market; and that legislative interference with them would be in effect an act to prevent the proper and natural development of production, to the injury of the whole people. It is claimed that such enormous masses of carefully organized capital are necessary to meet the competition of the great natural opportunities of countries which have hitherto been backward, but are now exhibiting a new energy in production; that, if the trusts limit competition at home, it is only destructive competition, whose limitation is for the good of all producers; and that the trust's natural desire to increase the number of its consumers, with the greater facilities for larger, cheaper, and better production, which its growing capital affords it, will prevent any injury to consumers. According to this view, the dividends of the trust would come from the prevention of waste, not from increase of price. And so we have attempts to form trusts in every conceivable form of human industry, even to milk and eggs, and a farmers' trust.

The process of widening its jurisdiction, which is open to all trusts, and is followed by some at least, has been described very clearly. It may be illustrated by an industry which it does not seem to have invaded yet. Suppose that the price of sewing-machines under competition is \$50; that the mass of production is done by twenty corporations, each controlling the

market in an equivalent territory; and that ten of the producers, believing that prices have been forced to too low a point, form a trust, which is to control production for the general good. If the trust should undertake to put up prices within its ten markets, some neighboring producer will invade its territory as soon as the selling price has risen sufficiently to cover cost of transportation. It is necessary, then, to bring the nearest producer into the trust. An increase of price to \$51 within the trust's ten markets will not be likely to decrease consumption materially, or to open the way to invasion of the trust's territory by competing products of other producers; but it will enable the trust, without changing its profits and dividends, to offer sewing-machines for sale at \$40 apiece within its nearest rival's territory until he consents to enter the trust. It is then easier for the eleven members of the trust to force another rival in, and then another and another, until all the desirable market is secured. The process stops only when the remaining producers are so remote or so much hampered by difficulties of production that they are compelled to sell at or above the price which the trust desires to fix, so that they may safely be considered as *hors de combat*.

The trust is now ready to raise prices within its territory to a rate which will afford to the component corporations such dividends as they could not have attained under competition. Its managers have by this time learned every condition of their market so accurately that they can operate as if by instinct. If, under the new conditions, a competitor appears who is so far handicapped by natural or personal disabilities that he can only make and sell sewing-machines at the trust's prices, he may safely be disregarded. If he is skillful, acute, or so favored by natural opportunities as to show indications of becoming a dangerous competitor, a slight increase of price in the remainder of the trust's territory enables it, without any decrease of dividends, to concentrate an enormous "cut" upon the market of its would-be rival, and crush him out of the business. All that is needed is a thorough knowledge of the conditions and a careful watchfulness on the part of the trust's managers, and competition really becomes impossible. Such a description cannot be answered by references to the high character of the men who control some of the trusts; the same road is open to all trusts, and, if some of them do not follow it, competitors exist through their forbearance, not by virtue of legal rights. The trust is the pool militant, and it will take the line of least resistance to success.

All this is quite compatible with the continued existence and activity of a considerable number of producers outside of the trust; these are producers whose natural prices do not interfere with the trust rate. It is compatible, also, with a steady decrease of price, if the industry is one the natural tendency of which is to decrease of price as improved methods give a larger production at the same cost of effort. In these two cases the trust may continue its usual dividends, while appealing to the decrease of price and the number of outside producers as coincident proofs of the virtue of its methods and the excellence of the results. It is difficult, however, to see that the consumer gets any benefit from the competition of such rivals, or that he gains all the natural decrease of price, as free competition would give it to him.

The effects on the consumer would be more clearly apparent if a successful trust could be formed in purely agricultural products, whose increase of production comes regularly with a more than proportional increase of effort and a consequent increase of price; it would very soon be seen that the consumer was paying the full natural increase of price, and something more. It would be still more evident if salt, for example, were an article of limited supply, and coincident attempts were made to form a salt trust and a wheat trust; the wheat trust would fail, unless it were a successful wheat-corn-and-oat trust, for any increase of price in wheat would drive a proportionate number of consumers to the use of corn-flour or oat-flour; the salt trust would be successful, if properly managed, for the consumer can and will use nothing instead of it, even at an increased price. In all cases, increased price is the essence of the successful trust, though it may be disguised in those cases whose natural tendency is to decrease of price; the trust's increased dividends are and must be paid by the consumer in a higher than the competition-price.

If, however, we should grant that the claim of the trust is fairly based, and that its limitation of produc-

tion and abolition of competition are for the benefit of the consumer, wherewithal shall we answer Socialism when we meet it in the gates? If an unofficial combination of producers is able to benefit the consumer by abolishing competition, why should not government agencies do the same thing, secure the same benefits to the consumer, and at the same time appropriate the trust's dividends for the additional benefit of relieving all consumers of just so much taxation? The argument offered on behalf of the trust runs on all-fours with the argument offered on behalf of Socialism; and any criticism of the former shows it to be even worse than the latter, for it really aims to benefit the producer, while the latter at least professes to aim at securing the benefit of the consumer.

The consumer can very well take care of himself, without the paternal care of the government, the Socialist, or the trust, provided only that competition be full, fair, and free. Whenever competition begins to be anything but full, fair, and free, it is high time to look up the legal defects which have produced that result, rather than yield tamely and weakly to the semi-Socialist argument advanced for the necessity and advantage of the trust.

OPEN LETTERS.

The Teacher's Vacation.

A GREAT deal is said and written for teachers upon subjects pertaining to their work, but very little concerning their vacations or hours of rest. The educational journals are filled with dissertations on the teaching of certain subjects and on methods of work. The result is that many teachers know better how to work than how not to work. They know better how to keep up a restless, worrying, unprofitable activity than how to rest in a manner conducive to the health of body and spirit. Most teachers are confined in the close air of their school-rooms for almost ten months of the year, and during this time are subjected, by the nature of their work, to severe nervous tension. They have not learned the first requisite of the good teacher, if under such circumstances they do not care for their health with the scrupulous watchfulness of the miser guarding his dearest treasures. Fresh air, exercise, regular hours for sleep and plenty of it, and wholesome food ("society" only in homeopathic doses) are indispensable. Where this regimen is not strictly observed, pellets, tinctures, tonics, plasters, powders, and, worst of all, the "substitute" teacher, must come in to supply the deficiency. Then the tired heart and brain must be goaded up with a tonic and the rebellious nerves chained down with an opiate, or the weary system cannot drag through to the end of the year. Some people are fond of quoting the saying, "It is a sin to be sick." This will admit of modification, but not in cases where plain natural laws, where common physiological rules, which all may know and understand, are violated. To the teacher who has just managed to "tonic" through to the end of the year, the vacation is a welcome haven; it is an oasis in the

desert of existence. It becomes the Elysium of the pill-taker, the Paradise of the headache fancier, the Nirvana of the nerve-shattered dyspeptic and rheumatic. If all teachers obeyed the laws of health strictly, if the needless worry, the waste of effort and the waste of emotion were eliminated — if, in short, teachers but served their consciences and better judgment with half the zeal they serve their whims and desires, many aches and pains and much sorrow and sighing would flee away. These words are not for those teachers who have expended much of their vitality in long years of public service. When such teachers are sick — it rarely happens — all know what it means. Much of the large measure of health, strength, and energy which was once theirs has been given out for years into the currents of public life. It has passed into the counting-room, the press, the pulpit, the bar; into the channels of trade and labor with the boys and girls for whom they have toiled.

Many teachers would be glad if there were no vacations. They are inclined to look upon these as periods of enforced idleness.

But it cannot be doubted that the vacation is far more valuable to teachers than the work and the money. The vacation and how it may be profitably spent are matters of importance to teachers whether they fully recognize it or not. Happy, thrice fortunate and happy, is that teacher who has friends, hospitable, generous friends, who insist upon a visit, and who will rescue her from heat, dust, and high brick walls. Much to be desired is the cool retreat by lake or wood, where good friends cheer with words and acts of kindness, where bracing breezes are laden with life-giving oxygen, and where the fresh, plain, savory fare of the farm and garden and orchard put new color into the cheek and new blood into the veins. Tonics and cordials will

not be needed until teaching, "society events," progressive euehre, and progressive physical derangement begin again. But there are teachers who must stay in the city and catch no glimpse of green fields and shimmering waters. Those who are thus penned up in the city often have resources which the migrating teacher cannot appreciate. They certainly have release from school work and have occupation for the mind, and this is great gain. For rest is not mere vacuity, it is not mere cessation from activity, it is not sheer idleness and utter release from responsibility. It is well, perhaps, that some teachers should have the leisure of vacation to live at home and perform more of those sacred duties that are enjoined by affection and family interest. What one teacher may gain in flesh and color among the green hills and flashing waters, another may gain in patience and devotion, in power of thought, in sweetness of spirit and depth of character in the home circle.

In whatever way the teacher's vacation may be spent, the prime object to be kept in view should be to store up, by change, rest, and pleasant recreation, the greatest amount of physical and mental energy. These things conduce to the teacher's happiness and efficiency. They contribute to the well-being and success of the pupils. Where the teacher has vigorous health and reserves of mental energy, there are enterprise, life, and industry in the school. There are found patience, justice, sympathy on the part of the teacher; obedience, confidence, and affection on the part of the pupils. With most teachers the sole capital which they have invested is their body. They draw interest, not on stocks and bonds, but on their brain, nerve, and muscle. Whether this may continue depends primarily on how the heart does its pumping, and how the stomach does its work. The manner in which these physical functions are performed governs largely the power to sleep, the disposition of mind and heart, and the capacity for work and study.

TOLEDO, O.

H. W. Compton.

More Anecdotes of Father Taylor.

THE admirable portrait of my old minister, Father Taylor, in *THE CENTURY* for February, 1887, brings him before me again most vividly as I have seen and talked with him in his house; but nothing less than a series of instantaneous photographs can convey an idea of his face when in the pulpit, under the power of his own matchless eloquence. It was at one moment a terror to evil-doers, and perhaps at the next it drew the sympathy of his audience as streams of tears coursed down his cheeks; and again, the tempests and the rain subsiding, a smile would come over it like the sunlight upon a peaceful sea.

Both writers in *THE CENTURY* have acknowledged their inability to portray his eloquence. It was truly something as much beyond the attempts of essayists as the representation of the man in all his attitudes was beyond the skill of a painter.

Mr. Whitman was correct in speaking of Father Taylor as an orthodox preacher. He was orthodox, "sound in the Christian faith," but he was not orthodox as the term is conventionally applied. He was a Methodist, and he had his own methods in spite of all conferences and bishops. They would have disciplined any other brother who indulged in such liberal ideas

and practices, had he been a country minister; but it is greatly to the credit of this austere sect that they recognized his innate goodness and his peculiar adaptiveness to the pulpit of that Bethel Church. They knew that no other preacher could take his place, and so they "let him have his full swing." He would not be bound by any iron-clad law of exchanges. He often exchanged with Unitarians, and when he got into a Unitarian pulpit, if the mood came over him, he would boldly proclaim his theology. But he was seldom a theologian unless it became compulsory for him to show his colors.

I remember once listening to a heavy Calvinistic discourse in the Bethel Church from a distinguished Boston clergyman. Father Taylor sat in the pulpit, and it was a study to watch the ill-disguised expressions of contempt upon his face. At last the sermon came to its end, and the preacher stepped aside to give Father Taylor the opportunity to make the closing prayer. Instead of that, he tapped the Calvinist on the shoulder, and looking down on the audience said with a calm smile, "Our good brother means well, but he don't know. I guess there's time enough for another sermon, so I'll just take his text and preach from it."

It was like a cloud-burst. Half the time he turned his back upon us, and rained down torrents of argumentative eloquence upon the brother upon the sofa behind. We all enjoyed the scene immensely. At last Father Taylor subsided and, extending his hand to the clergyman, said, in his most gentle tone and in his most winning way, "Brother, forgive me if I have hurt your feelings, but I did not want you to come on this quarter-deck and kick up a mutiny against Divine providence among my crew."

I could relate many anecdotes of Father Taylor, some of which Dr. Bartol will call to mind.

When he began to preach around Boston (he told us this himself), he visited Duxbury. In those days there was only "the old meeting-house" in country towns. It is a pity that there are more meeting-houses in some of them now. One minister was all that the town could well support, and by common consent he was the head of the church and of the village.

When the young Methodist, full of ardor and enthusiasm, by the dictate of natural politeness called on the dignified Dr. Allen, the latter asked him what was his business. "To preach the gospel to every creature, as my Master has commanded," replied Taylor. "Is n't that what the Bible tells us?"

"Yes, it tells us that," answered Dr. Allen, "but it does n't say that every creature can preach the gospel. I preach all the gospel that is wanted in Duxbury." Taylor was obliged to look elsewhere for an audience.

In the year of the Irish famine the Government, at the instance of Commodore de Kay, placed the United States sloop-of-war *Macedonian* at the disposal of the merchants of New York. The *Jamestown*, which was loaned to Boston, was commanded by Captain R. B. Forbes, and its cargo of corn and flour was chiefly contributed by the venerable Thomas H. Perkins; the *Macedonian*, under the command of Commodore George Coleman de Kay of New York, formerly a volunteer in the Argentine navy, sailed about the same time on a similar errand of mercy. Father Taylor was supercargo and chaplain of the *Macedonian*. On his return from this benevolent embassy we gave him an ovation at the Bethel. He was always fond of re-

fering to "Boston's merchant princes." On this occasion Colonel Perkins was present. Father Taylor was unusually eloquent upon his favorite theme. "Boston's merchant princes!" he exclaimed. "Do you want to see one of them, boys? There he sits; look at him!" The whole congregation arose and, to the utter confusion of the old gentleman, fixed their eyes upon him as Father Taylor thus apostrophized him: "God bless you, sir! When you die, angels will fight for the honor of carrying you to heaven on their shoulders."

In the course of his sermon, which was mainly a description of his voyage and his experiences abroad, he said that "the famine was sent by God to soften the hearts of Americans and to harden the heads of Irishmen. The Irish had lived on potatoes too long. There was no phosphorus, no brain food, in a potato. They were now taught by our charity to live on wheat and corn." Perhaps the English Government at this day may attribute Irish contumacy to their change of diet.

Once when Father Taylor was in the midst of a most eloquent sermon, his voice pitched to its highest key, a man rose from his pew near the pulpit and started to walk down the broad aisle. Suddenly as a typhoon sometimes subsides to a calm, the old man stopped, and then in that peculiar whisper of his which pervaded the whole house, went on, "Sh — sh — sh! Keep still, all of you, and don't disturb that man walking out."

It was a very funny incident when a newspaper reporter, who is still living, and who will surely pardon me for telling of it, as for once he got the better of Father Taylor, came into church rather late after the pews were all filled, and men were sitting on the pulpit stairs. Father Taylor saw him, and called out in a loud voice: "Come up here, McLean, and sit down on the sofa." McLean accepted the invitation, and it might be supposed that he was somewhat disconcerted when Father Taylor turned to him and said, "Now get up and pray, you sinner!" But nothing disconcerts a newspaper reporter. I don't know if my old friend had had much practice in the exercise, but he arose unabashed and offered a very creditable prayer, in which, as he had been a sailor himself, he introduced suitable nautical phraseology, and concluded by commending to the mercy of Heaven "this whole sinful crew, and especially the skipper."

I once heard Father Taylor preach a sermon on the Atonement. It was all in a style that nobody but a sailor could understand, a style that every sailor could comprehend, although a treatise on this subject from an up-town pulpit would have been "Greek" to him. This was one of the passages: "You are dead in trespasses and sins, and buried too, down in the lower hold amongst the ballast, and you can't get out, for there is a ton of sin on the main hatch. You shin up the stanchions and try to get it open, but you can't. You rig a purchase. You get your handspikes, capstan bars, and watch tackles, but they are no good. You can't start it. Then you begin to sing out for help. You hail all the saints you think are on deck, but they can't help you. At last you hail Jesus Christ. He comes straight along. All he wanted was to be asked. He just claps his shoulder to that ton of sin. It rolls off, and then he says, 'Shipmates, come out!' Well, if you don't come out, it is all your own fault."

It was on the Sunday before a State election. Briggs was the candidate of the Whig party, but Father Tay-

lor desired that he should be elected because he was a religious man. This was his prayer: "O Lord, give us good men to rule over us, just men, temperance men, Christian men, men who fear Thee, who obey Thy commandments, men who — But, O Lord, what's the use of veering and hauling and pointing all round the compass? Give us George N. Briggs for governor!" His prayer was answered on the next day.

Father Taylor was eloquent, humorous, and pathetic by turns. Sometimes all these characteristics seemed to be merged in one. These and many other of his traits interested me, but I loved him because, first and last and all the time, he was the sailor's friend.

John Codman.

Extend the Merit System.

THE objections to civil service reform come principally from those who are or who aspire to be politicians. To have the offices filled by worthy and competent persons, whose term of office is not dependent on the success or defeat of any party, would rob this numerous class of their stock in trade, and permanently retire them from politics.

What difference does it make to me whether the postmaster of my village is a Democrat or a Republican, if he be competent and obliging? The same is true of the county officers. Politics should have nothing to do with them, for they have nothing to do with politics. There are only a few political offices. Why should the non-political officers, when experience has made them capable, be turned out every time the party sentiment changes, and their places filled by inexperienced men whose only merit is their partisanship? There can be no satisfactory answer given to this question in the affirmative; but that they should be retained as long as they are efficient and honest is patent from these reasons: First, it would be a saving of expense; secondly, it would secure a better service; thirdly, it would elevate and refine politics.

1. The postmasters, in all cities of eight thousand inhabitants and upwards, are commissioned for four years. There is no promise, no matter how faithful, that their term of office will be longer. They receive a stated salary. Now it is a fact, that could they hold their places for a long term of years, free from contributions and other exactions, they would gladly serve the public for two-thirds of what they now receive, and this is true to some extent of their subordinates, and also of those who fill the smaller offices. It is safe to say that in the Post-Office Department thirty per cent. of its present cost would be saved, and the people better served. Take our county officials: they are rarely reelected. When their term of office expires they are hardly proficient, but out they go and a new set is installed; and even a layman of any experience knows what perplexity and uncertainty is occasioned by these new officers. To estimate the damage to suitors and others in Pennsylvania, caused by mistakes and omissions of inexperienced officers, at one hundred and fifty thousand dollars per annum is within bounds. The frequent elections require a large expenditure of time and money. It often takes years to accomplish the end after the office idea is hatched. Then, when one is successful there are ten who fail. The aspirants spend their time and money, and the

people suffer from this loss besides footing the bills of the too frequent elections. If our county officers could hold their office for a term of twenty years, if they remained competent and honest, and be free men, under no party obligations, they could well afford to fill the places for half of what they now receive. This would be a net saving of forty-five per cent. directly, to say nothing of the indirect saving. An absolute civil service reform would enable us to run the government, nation and state, for sixty per cent. of the present cost. Then why not have it, and let the politicians take care of themselves? 2. It would secure a better service. That an officer of experience is more efficient than one who is inexperienced is self-evident. Civil service would, in the main, give us men who are suited for the place, and experience would ripen, making them good officials. 3. It would elevate and refine politics. Who are the active politicians? Are they our best men? Unfortunately they are not, as a rule. A man of honor and self-respect enters the political field with fear and trembling. If he succeeds, it is an exception. To be a politician of to-day, one must lose sight of everything but the goal. He must be ready to violate an agreement, to make all manner of promises, to ask, beg, and even buy votes, and support his party, right or wrong. These are only a few of the offices that are political, but by the nefarious system which has so long been in vogue they have all been wrongfully made to represent party, and consequently a horde of office-seekers have arisen, and in their unholy scramble for place they have forsaken all decency, and thus have degraded our whole system. Civil service reform would, in a great measure, cut off this element. There would be but little chance to bargain and sell. The strictly political offices would be prominently brought out, the people would vote according to their convictions,—for the incentive to stick to party, at all hazards, would be gone,—and the result would be better officers, from President down.

P. F. Hallock.

The Abolition of Slavery by the Cherokees.

IN 1861 the Cherokees had long been a slave-holding people under the influence of their early surroundings. The war found them already divided into two factions. Under the influence of Southern emissaries the disloyal Cherokees were organized into "Blue Lodges" and "Knights of the Golden Circle," while the loyal masses by a spontaneous movement organized themselves into a loyal league known as the "Ketoowah," sometimes derisively called the "Pin Society," in allusion to the two crossed pins worn by the members on their jackets as a distinguishing mark. The Ketoowah societies were soon to be found in every part of the Cherokee nation, and embraced in their membership a great majority of the voters, especially of the full-blooded Indians. The meetings were always held in secret places, often in the deep forest or in the mountains, and the initiates were given to understand that a violation of the sacred oath was a crime punishable by death. The primary object of this league was to resist encroachments on Indian rights and Indian territory and to preserve the integrity and peace of the Cherokee nation according to the stipulations of the treaty of 1846, but it finally united in working for the abolition of slavery, and by its means a

large majority of the Cherokees became at length firmly grounded in their fidelity to the Federal Government.

The Cherokees numbered in 1861 about 22,000. Of these 8500 joined the Confederates and went south, and 13,500 remained at home. On the 21st of August, 1861, the Cherokees, finding themselves at the mercy of the Confederate forces and practically left to their fate by the Federal Government, met in convention at Tahlequah and resolved to make a treaty of peace with the Confederate authorities; but on February 18, 1863, finding themselves no longer constrained by superior force, a national council was held at Cowskin Prairie, where the treaty was denounced as null and void, any office held by a disloyal Cherokee was declared vacant, and, more remarkable still, an act was passed abolishing slavery in the Cherokee nation. Through the kindness of the chief, I have been permitted to copy an act from the records:

AN ACT EMANCIPATING THE SLAVES IN THE CHEROKEE NATION.

Be it enacted by the National Council: That all Negro and other slaves within the lands of the Cherokee Nation be and they are hereby emancipated from slavery, and any person or persons who may have been held in slavery are hereby declared to be forever free.

Be it further enacted, That this act shall go into effect on the twenty-fifth (25th) day of June, 1863. And any person who, after the said 25th day of June, 1863, shall offend against the provisions of this act, by enslaving or holding any person in slavery within the limits of the Cherokee Nation, he or she so offending shall, on conviction thereof before any of the Courts of this nation having jurisdiction of the case, forfeit and pay for each offense a sum not less than one thousand (\$1000) dollars, or more than five thousand (\$5000) dollars, at the discretion of the Court.

Two-thirds of said fine shall be paid in the National Treasury, and one-third shall be paid, in equal sums, to the Solicitor and the sheriff of the District in which the offense shall have been committed. And it is hereby made the duty of the Solicitors of the several Districts to see that this law is duly enforced. But in case any Solicitor shall neglect or fail to discharge his duties herein, and shall be convicted thereof, he shall be deposed from his office, and shall hereafter be ineligible to hold any office of trust or honor in this nation.

The Acting Principal Chief is hereby required to give due notice of this act.

Be it further enacted, That all laws and parts of laws conflicting with the provisions of this act are hereby repealed.

George E. Foster.

"The Last Hope of the Mormons."

IN the October number an editorial with the above title inadvertently used the word "disfranchise" in the sense of a refusal of Statehood. No territorial disfranchisement of the body of the Mormons could have been intended, since nothing of the kind has taken place.

BRIC-À-BRAC.

WHAT 'S IN A NAME!

Observations.

NONE are such accomplished dissemblers as those who find dissembling difficult.

THE surest way to reveal your weakness is to hide your motives.

A NOTE pitched too high is equally silent with one pitched too low.

A GOOD cause seldom fails through the judiciousness of its enemies; but often through the injudiciousness of its friends.

THE sublimity of the mountain is not in the mountain, but in us.

EACH man is a walking coal-mine, and it is for him to decide whether it shall send forth heat and light, or only soot and smoke.

MORE strength is needed to abstain from work when tired, than to undertake it when rested.

THE safety of the spire is not in the thinness of the top, but in the solidity of the bottom.

THE true host entertains so that on leaving the guest feels more pleased with himself than with his host.

HE who is unwilling to submit to undeserved blame should remember to refuse undeserved praise.

GENIUS is like a barrel on the top of a hill: it will not indeed move unless pushed; but once pushed, it goes of itself. Talent is like a load on the roadway; it will not go forward unless dragged.

THIS is the difference between a noble thought and a merely brilliant thought: the former, like a friend, improves on acquaintance; the latter loses its force on a second meeting.

WEAKNESS trusts in its strength; strength fears in its weakness.

HE who is unconsciously selfish is not so dangerous as he who is consciously so; the former betrays his selfishness, the latter conceals it.

Ivan Panin.

The Friend of Ages Ago.

"Should auld acquaintance be forgot?"
—Yes, if you'd just as lief as not.

John Paul.

THERE are several things that trouble one's age,
And work for a man much woe,
Such as gout—and doubt—debts that *will* run,
And rhyme that *will not* flow.
But when all has been said, do we not most dread,
Of the many bores that we know,
That ubiquitous ban, the woman or man,
Who knew one "ages ago"?

In youth—you were young; and foolish perhaps;
You flirted with high and with low,
Had one love on the hill, and one down by the mill—
Yet never were wicked, ah, no!
And this friend knew you in a far-away way,
In a way that was only so, so—
Just enough to give hue to the cry about you:
"Oh, I knew him ages ago!"

You are married now and quite circumspect,
Your pace, like your speech, is slow.
You tell in a bank, keep silent in church—
Are one it is proper to know;
But this vigilant friend will never consent
That your virtues unchallenged shall go—
Though she never demurs, but only avers
That she knew you "ages ago."

And sure I am that if ever I win
To the place where I hope to go—
To sit among saints—perhaps the chief—
In raiment as white as snow,
Before me and busy among the blest—
Perhaps in the self-same row—
I shall find my ban, this woman or man,
Who knew me "ages ago."

And shall hear the voice I so oft have heard—
Do you think it is sweet and low?—
As it whispers still with an accent shrill
The refrain that so well I know:
"Oh, you need n't be setting much store by *him*,
This new angel 's not much of a show,
He may fool some saint who is n't acquaint—
But *I* knew him ages ago!"

Charles Henry Webb.

Consolation.

DEAR Betty, when an hour ago
You scorned my humble offer
Because my lean and empty purse
Was not a well-filled coffer,
Why did you breathe your cruel "No"
With such a frightened quiver?
Perhaps you thought I meant to seek
Some suicidal river.

Ah, no, sweet girl! These modern times
Of cynic calculation
Take wiser ways and means to end
A lover's desperation;
And Corydon no longer sighs
His heart away in sorrow,
But seeks a richer Phillis out
And woos again to-morrow.

M. E. W.

The Ladies of Manhattan

ODE TO PHILADELPHIA: STOLEN FROM DOBSON.

THE ladies of Manhattan
Go swinging to the play,
A footman and a coachman
On top of each coupé:
But Philada, my Philada!
Whene'er she goes as far
As First-Day evening meeting,
She takes a cable car.

The ladies of Manhattan,
According as they feel,
Wear nothing on their shoulders
Or coats of silk and seal:
But Philada, my Philada!
Has neither frills nor furs;
The turtle-dove's soft raiment
Is not so neat as hers.

The ladies of Manhattan
Are always going out,
They run from call to concert,
They drive from ball to rout:
But Philada, my Philada!
Has no such round perennial
Save when, in every dozen years,
She gets up a Centennial.

My Philada, my Philada!
Although it be so grand,
The style of all Manhattan
I do not understand;
I care not what the fashion
Of all the world may be,
For Philada—for Philada,
Is all the world to me!

G. F. Jones.

Love In Leap-Year.

SHE asked him once, she asked him twice,
She asked him thrice to wed.
He thought her friendship "very nice,"
But each time shook his head.

At last, when he felt more inclined
The wedded state to try,
He told her he had changed his mind;
But she said, "So have I."

Kemper Bocoek.

Divided.

I BREATHE to-night the icy blast
That blows o'er wintry meadows wide:
You sent the orange-bloom and rose,
A far, Floridian stream beside.

Yet were I there, or were you here—
But an arm's reach from heart to heart—
What should we gain? we still would be
Lost love! the width of our fate apart!

C. E. S.

The Tale of the Tiger still drags its slow
length along!

WHEN my wife flies into a passion,
And her anger waxes wroth,
I think of the Lady and Tiger
And sigh that I chose them both!

UPPINGHAM.

AN ANCIENT SCHOOL WORKED ON MODERN IDEAS.

SEAL OF UPPINGHAM SCHOOL.

HITHERTO the great public schools of England have been looked upon by the people of America rather as objects of antiquarian interest than as offering a most important field of study in connection with the complex problem of education. The adoption of the Norman castle as a type of domestic architecture in America would scarcely be regarded as a greater anachronism than an attempt to reproduce in our systems of education anything like Eton and its methods.

Reproduction, however, is one thing; the study of underlying principles, with a view to adaptation, quite another. Educational questions are not so entirely settled among us that we can afford to overlook the lessons to be learned from methods and institutions which have filled a great place in educational history; which have left their stamp strongly upon the English character; which have trained many of the ablest men of modern times; which still hold, in spite of their openness to criticism in detail, a safe place in the estimation of a most practical people; and which are now, in many cases, showing themselves capable of adaptation to the new wants and new ideas of the nineteenth century, even while clinging to some of the traditions of the fifteenth and the sixteenth. Not only are the great schools of England still strongly intrenched in the favorable opinion of the public on which they chiefly depend for support, but the system on which they are based — that of educating boys away from home — has of late years had an immense

development. Old foundations have been re-suscitated, and new ones created on a large scale and in great numbers. Whole classes of English society, which a generation ago would not have thought of using them, now look to these schools as the best instruments of education within their reach. This is especially true of the mercantile class, which is usually looked upon as the most practical of all. Development of this kind rarely occurs without a sufficient cause, and where there is such vitality there must be permanent underlying principles of strength which deserve at least attentive study. This study we on this continent have not yet given to that special aspect of educational work which the English public school takes as its peculiar province.

Everywhere throughout America we find boarding-schools for boys — sometimes worked under denominational auspices; oftener, perhaps, owing their temporary existence or measure of success to the enterprise or energy of individual teachers. Few have a long history or a fixed reputation, and fewer still realize anything like an ideal completeness as instruments of education. Yet it may be affirmed that the organization of boarding-schools on an educationally scientific basis, with a view to the most complete efficiency, is a matter of national importance, because they answer to a permanent national want. This will appear from the following considerations.

In any large and highly organized community there must always be a considerable number of people whose duties or circumstances are such as to destroy the character of home as a suitable place for educational training. In Great Britain, for instance, military and naval officers, with Indian, diplomatic, and colonial

officials, cannot look forward to having their children educated under their own eyes. Men in political life, distracted by the excitements of their work, and usually migrating from country to town with the legislative seasons, are scarcely better off. The preference of the landed proprietors of England for living on their own estates involves educational isolation, and makes it necessary that boys should be sent away for training. Here we have already a very large body of people for whom the public school, with its provision for home care, as well as mental training, is practically a necessity. A larger question of expediency still remains. The sons of the wealthy very seldom get a fair chance for training in their own homes. Luxury, social distractions, the excessive environment of dependents, all militate against mental industry and moral tone. It is this consideration which leads the average Englishman of wealth to send his boy away from home to the simpler life and steadier discipline of the public school.

It will be at once admitted that like conditions widely prevail throughout America, with a distinct tendency to increase. A fair chance for training is rendered impossible in great numbers of homes from mere circumstances of occupation or location, many forms of which will readily occur to the reader. The vast increase of wealth, also, has led to a degree of domestic luxury, extending over large social areas, incompatible with healthful home training for boys. It is probably utopian even

to hope that the lives and habits of the rich will be revolutionized to meet the educational necessities of their children. The thought may be carried a step farther. Without underrating the healthful influence of a good home, it may yet be urged that able men and women, specially trained to deal with the young, devoting their thought and time through life to the theory and practice of education, in thoroughly equipped institutions where the whole daily life is kept subsidiary to the main work of training, ought to attain results not to be expected from the irregular and undisciplined superintendence of even conscientious parents. This is only to say that skill counts for as much in the training of the young as it does in any other business of life. In our day-schools the laxity of home life too often neutralizes the best efforts of the best teachers; skill ought to find its fairest opportunity where it can make the home life and the school life work hand in hand.

Without pressing this view to its ultimate conclusion, it may yet be claimed that the wealthy classes of America have never yet fully realized the duty, or faced the difficult problem, of providing for their children some sufficient corrective for the enervating influences which surround them. A representative American thinker lately said to me, that, contrasting the operation of Anglo-Saxon institutions in England with those in America, the most important result, in his opinion, with which we may credit ourselves on this continent is the

UPPINGHAM.

THE CHAPEL ENTRANCE.

facility of individual movement from the bottom to the top of the social scale. This is a broad, patent fact, which underlies and largely causes that hopeful energy which permeates even the lower strata of society in America, and forms a striking contrast to the social inertia and consequent mental inactivity of the lower classes of England. I think, however, that we are bound to qualify our satisfaction on this point by the equally manifest fact that the facility of descent from the top to the bottom of the same social scale is infinitely greater in America than in England. Taking our society as a whole, there is comparatively little conservation of force and culture along family lines. The weakening influences of wealth and high

social position on the young have no adequate corrective. The ruling names in the society or politics of one generation seldom repeat themselves in the next. Each generation has to hew its best class out of rough material taken from beneath. Now success in life which fails to transmit as an inheritance force or culture or superiority of some kind has failed in that point which makes success most of all desirable. Society itself is an immense loser where the results of success end with the individual. It is a national calamity when the grand advantages given by wealth for attaining personal excellence are thrown away.

There is reason to believe that the rich Englishman finds for his children in the great pub-

lic schools the best antidote for the enervating influences of wealth. It may be a schoolmaster's view, but I have a firm conviction that these schools have long been, and are, the real salvation of the upper classes of English society. Here a boy drops rank, wealth, luxury, and for eight or ten years, and for the greater part of each of these years, lives among his equals in an atmosphere of steady discipline, which usually compels a simple and hardy life, and in a community where the prizes and applause are divided about equally between mental energy and physical vigor. Here respect and obedience become habitual to him; he learns to regard the rights of others and to defend his own, to stand upon his feet in the most democratic of all societies—a boy republic. Above all, he escapes the mental and moral suffocation from which it is well-nigh impossible to guard boys in rich and luxurious homes.

If it be admitted that home, in a great number of cases, is not a fit place for training, then the question of providing the best possible substitute for home becomes one of the first importance. What is the best type of boarding-school? For an answer we naturally turn to the great English schools, with their experience of centuries. Limitations, however, to our field of study at once present themselves, if

we keep in view the idea of adaptation to the wants of this continent. One of the most distinguished head-masters of modern England said to me a few years ago, that in the great foundation over which he ruled he saw clearly enough numbers of things which cried out for reform, but that his hands were almost completely tied by the strength of tradition and public prejudice. Few men are ready to make so frank a confession, yet there is no doubt that this one might truly be made by most of the masters of the famous schools of England, the greatness of which has been achieved in spite of great structural defects. For a type we want to find some place where tradition and prejudice have not been allowed to stand in the way of something like theoretical completeness in structure and development. It is my purpose in the following pages to describe such a school—one in which the best spirit and traditions of the old foundations have been preserved, but to which the persistent endeavors of a great educational reformer have given a structural completeness which will, I believe, bear the strict analysis of educational science. If I am criticised for asserting that the ideas on which its structure is based mark a great advance on anything that has gone before, and almost an epoch in educational practice, I would only ask that

ELIZABETH SCHOOL-HOUSE, 1584.

ANOTHER VIEW OF THE OLD SCHOOL.

criticism may be preceded by actual investigation of the facts.

The small market-town of Uppingham is situated in Rutland, one of the smaller mid-land counties of England. Its situation on higher ground, to which it owes its name, gives it a fresh and bracing air, which is no slight consideration in fixing upon a suitable location for a large school. Here Uppingham school was founded "by God's grace," as the first words of the old statutes say, in the year 1584, by Robert Johnson, afterwards archdeacon of Leicester. By him it was endowed as a "faire, free grammar school," with certain lands and properties. Queen Elizabeth's charter dates from 1587. The control of the school was placed in a trust, and the dignity of hereditary patron was to remain in the family of the founder. At the celebration of the tercentenary of the school in 1884, the patron's chair was taken by A. C. Johnson, Esq., the present English representative of the family. His son, the next in succession, is now a pupil in the school, and has already been dubbed "Founder" by his playmates. It may interest American readers to know that Uppingham claims, through its founder's family, some connection with early New England history. Isaac Johnson, a grandson of the archdeacon and one of the governors of the school, married Lady

Arabella Fiennes, daughter of the Earl of Lincoln, and in 1630 they came with Governor Winthrop to New England, having invested a large sum of money in the scheme for founding the colony. Both husband and wife died within a few months of their arrival. From Robert Johnson, who settled in New Haven about 1636, there has been a continuous line of descent in America. From him was descended Samuel Johnson, D. D. (Oxford), the first Episcopal clergyman in Connecticut, and the first president of King's (afterwards Columbia) College, New York City, and William Samuel Johnson, LL.D. (Yale), who was a member of the convention that framed the Constitution of the United States, and was the first United States senator from Connecticut. Of this branch of the family there are many American representatives.

Interesting as they are from an antiquarian point of view, it is not my intention to speak here more particularly of the original founder and his scheme for the establishment of the school. It is enough to say that those who have built the modern Uppingham on Robert Johnson's foundation have drawn strong inspiration from the feeling that their work had its origin far back in a worthy past, and that they were only enlarging the noble design of a

generous Christian man. The annual income at present from the original endowment is about £1000. The smallness of this sum, as compared with the endowments of some of the great schools, brings out in striking relief the odds against which Uppingham has had to contend, and the sound business as well as educational principles on which the

wrote an address to the teachers of Minnesota. To those who have thus become familiar with his views on education, some record of his actual work will doubtless be doubly interesting.

Nine years as a boy at Eton, where he became head of the sixth form and captain of the school, with subsequent work as examiner at both Eton and Rugby, gave him a sufficient

HEAD-MASTER'S HOUSE.

remarkable growth of the school has taken place.

For two hundred and seventy years after its foundation the school was carried on with fortunes varying with the ability and energy of successive masters, having on its rolls many names afterwards distinguished in church and state. In 1853 Edward Thring* was appointed to the head-mastership. This may be fixed as the date of the second founding of the school. Mr. Thring's name is already widely known in America through his two books, "Education and School" and "Theory and Practice of Teaching," the latter of which has been adopted as a text-book in at least one important normal school of the Western States. Last year, in response to an invitation, he

insight into the good and bad of public-school life. Later, in connection with clerical duties, teaching in the national schools gave him practice in dealing with the minds of children, and aroused that enthusiasm for training boys which has inspired him in his efforts after reform in school methods. When he entered upon his work at Uppingham there were in the school 25 boarders only, and these, with 5 or 6 scholars from the village, made up the material on which he had to begin. The field was small, but a man had come who had decisive views about education, and with faith, courage, and will to match the strength of his convictions. Around such a man the horizon widens. Mr. Thring's experience is unique in the school history of England. In his own

* Mr. Thring died in October, 1887, after this article was completed. It has been considered best to let the paper appear without any change. The tributes to the greatness of Mr. Thring's work and char-

acter which have appeared in the leading journals of England and America prove that the devotion of personal friendship did not lead me to overrate the significance of his life's work.

BOYS' HALL, HEAD-MASTER'S HOUSE.

lifetime, and as the result of his thirty-two years of work, he has seen Uppingham, in open competition with foundations of enormous wealth and fame, lifted from its place as a local grammar school into the very front rank of English public schools. People call this a marvelous triumph of personal force and energy. Mr. Thring himself would repudiate such an explanation as inadequate, and claim that his success is a triumph of principle. Between these views we need not decide. Nothing but a powerful personality could have accomplished such a work, but the greater merit may have lain in breaking through the thick crust of custom, tradition, and prejudice which inwrap public-school life in England, and so finding a solid foundation of educational principle on which to build. That Mr. Thring has proved, in both theory and practice, that such a foundation exists, there can be no reasonable doubt. His work at Uppingham has centered around two or three clear and sharply defined ideas—some principles of educational conduct which may be looked upon as fundamental and universal. The first of these, and that from which everything else springs, is simple

enough. It is that every boy, stupid and clever alike, should have a fair chance and should be really trained. Mr. Thring claims that no school, however great its prestige, numbers, wealth, or its list of prize-winners, can be called a good school, or even an honest school, unless it makes this a first condition of its work. The importance of the principle cannot be overestimated. Fully accepted and acted upon it would revolutionize most of the schools of England, and probably most of those in America. No true judgment of a school's real merits can be formed from its prize-winning record. Given a school which draws some hundreds of boys from classes of society where the earlier training is fairly good, let it have wealth enough to attract a number of exceptionally able teachers, turn the teaching power of these upon even a small proportion of the cleverest pupils, and you may have a school with an overwhelming list of university and other scholastic distinctions, while the mass of the boys are almost entirely neglected. That this picture does not unfairly represent the work of some famous schools is a known fact. That the evil of giving training

UPPINGHAM MARKET-PLACE.

to the strong at the expense of the weak, who are allowed to go to the wall, prevails in the majority of schools, small and great, will scarcely be denied.

Justice, then, which means adequate individual training for each boy, is the central idea of Uppingham, and all the arrangements and machinery of the school are directed to this end. The first step towards securing it is by putting a strict limit upon the size of each class. Mr. Thring fixes the maximum size of a class at about twenty. This is large enough to give the stimulus of numbers and competition; it is not too large, if the class is properly graded, to prevent individual attention and training. A school which in its main subjects of instruction, such as classics and mathematics, places numbers much larger than this under a single teacher, is able to pay larger salaries, but it does so at the expense of efficiency in individual training. The application of the same principle to the boarding of the boys does away at once with everything that savors of the old barrack methods, once universal and still only too common, under which numbers of boys were herded together in large buildings, with little domestic supervision, and no opportunity for seclusion. Numbers are necessary for a great school, and contact with his fellows is essential to a boy's getting the full advantage of public-school life; but unwieldy numbers make discipline difficult and training impossible, while unchecked contact with a mass of thoughtless

natures breaks some characters even though it strengthens others. At Uppingham the number of boys in a single house is restricted to thirty. This enables the master and mistress of such a house to take a personal interest in each boy, and to surround all with something of the refining and humanizing influences of home. As the houses are intended to be homes, they are not grouped together in a block or quadrangle, but are built separately; each with grounds of its own, and with such surroundings as the taste of the house-master suggests or his means allow. A visitor misses at Uppingham the imposing blocks of buildings which characterize other great schools, but in the eleven handsome villas scattered within a quarter of a mile of the main school-buildings he sees something far better adapted for the training of young lives. The advantages of this arrangement are manifold. There is less chance for large combinations for purposes of insubordination or evil of any kind. The house-master has a more independent field of work. He cannot shift the responsibility for ineffective discipline on any one else, and the credit for good results is all his own. Each house has a reputation of its own to maintain, and this leads to a healthy rivalry both in studies and in athletic games, which in turn fosters sympathy between the master and his pupils. As in the limited class, so in the separate house, justice can be done to the individual life, and the weaker are allowed a fair chance. There is a further safeguard still in the provision made for the private life of the boy, by a method simple enough in itself, but of the deepest significance as an aid to training. Each boy in Uppingham has a study of his own,—intentionally made quite small, usually about five feet by six,—which is meant to be for him a real sanctum, a little home, where he can be alone when he wishes, either for study or for

THE BOYS' STUDIES.

that retirement which boys as well as men need at intervals in order to collect anew their moral forces during the rough struggles and the temptations of daily life. These studies are entirely separate from the sleeping-apartments. For the latter, the small dormitory, holding a very limited number of boys, is adopted for sanitary and other reasons; but here, too, the idea of individual privacy is maintained by providing separate compartments for each boy. It is found that the house space required for giving each boy this separate study and sleeping-compartment is not much greater than what is needed for the ordinary bedroom arrange-

or cowed, to sensitive boys a danger among the most difficult of all to deal with in a great public school. The arrangement of these studies, which are one of the most characteristic features of the school, varies in the different houses according to architectural exigencies. In the head-master's house they surround a quadrangle, and with their overgrowing masses of ivy give a very picturesque effect. The great taste and care very commonly shown in their adornment with flowers and home pictures prove that they touch deeply in the boys the instincts of personal ownership.

A school never ought to depend for its

THE SCHOOL ENTRANCE.

ment. The advantages of the Uppingham system are great.

The disuse of the dormitories by day makes perfect ventilation possible. As the boy takes his meals in the hall, and sleeps in the dormitory, his study becomes a private sitting-room where his books, furniture, and material for work need be disturbed but little from day to day. The small size of the studies prevents the congregation of numbers, and makes strict rules upon this point easy and natural — an important fact for the masters in respect of discipline; important too for the boy, as giving him security from the bullying or persecution of a crowd by which he might be overmatched

character on the exceptional excellence or success of a few of its masters. If it does, these few reputations may become cloaks for a vast amount of poor work, and the character of the school, as a school, is a sham, without any element of fixity in it. The ordinary arrangements should have a strong tendency, at least, to insure sound work, from the lowest to the highest class. The method at Uppingham by which it is attempted to fix this tendency is of special interest. The house-master is not, necessarily, either the public or the private tutor of the boys under his domestic care. He has his own form or grade in the school, drawn, perhaps, from all the houses, while his

CARPENTER-SHOP.

boarders are, for tutorial purposes, distributed, according to their standing, among all the masters.

Thus each class-master has but one class to teach, and being private tutor as well as public teacher for his class, his responsibility for its work is absolute, and cannot be shifted to other shoulders, as under the Eton method, where the private tutor's work is distinct from the school teaching. He has also but one range of subjects to teach, in itself an important guaranty of efficiency. His success, however, must always depend on the effective teaching of each class-master below him, through whose hands his form has come, and in whose work he therefore has the deepest personal interest. Again, each house-master has the same interest in the efficiency of the class-masters who have charge of his boys. Thus the whole moral pressure of the staff inclines towards compelling good work from the top to the bottom of the school. A man as a house-master has to maintain towards the parents who form his constituency his reputation for discipline and wholesome moral influence on the boys under his charge; as a class-master, not only towards the supporters of the school, but towards the whole body of teachers of whom he is one. Thus the great school becomes a unit, its character a measurable quantity—the tendency of its structure towards effective work throughout. A school can, in my opinion, have no higher merit.

"The limits of a first-rate public school in point of numbers," says Mr. Thring, "are just as well defined, and as capable of proof, as

the limits of a first-rate class." It must be large enough to attract and permanently retain a sufficient number of able men, capable of doing high-class work, and give them adequate remuneration for making training the business of their lives. But it must not be so large as not to be able to do all its work well. A chief factor in the consideration is the period during which boys attend school. In the great English schools which mainly prepare for the universities, the ordinary limits of age are from ten to nineteen. For good class work, combined with efficient individual training, it is essential that no boy should be far in advance of his class or far behind it. To provide for proper gradation, there ought to be a class for each half-year. A school,

then, which keeps boys from 10 to 19 must have about 16 classes. As no class should number more than 20, and the upper classes tend to drop considerably below this, it follows that a school undertaking to do first-class work over this number of years should have not much more or much less than 300 boys. With smaller numbers teaching power is wasted, for the number of classes must be maintained if justice is to be done to those of every age. With larger numbers the teacher is over-weighted and the individual pupil neglected. In smaller schools a narrower limit placed on the ages of attendance, proportioned to the size of the staff, alone can secure similar efficiency. This argument seems conclusive, and is, in effect, only applying to a large boarding-school the system of grading familiar to us in our best-organized day-schools. Taking his stand on this principle, Mr. Thring has fixed about three hundred as the maximum attendance which he will permit at Uppingham. To abide steadily by such a principle has required no little resolution and self-sacrifice. When once a school has achieved a great reputation the temptation to trade on that reputation

SWIMMING-BATH.

is very strong. Greater numbers in the houses and in the classes means greater glory for the school, with larger incomes and a greater percentage of profit for the masters.

A large increase in the school means wealth in the form of capitation fees for the head-master. The example of some of the great

tellect. Our ordinary day-schools cannot hope to do this in a like degree. In the few hours during which the teacher has charge of his pupils he strives to engage their attention, train their faculties, and, if possible, reach to some extent the heart as well as the head. Then they go back to an infinite variety of

A DRAWING-CLASS.

schools is not such as to encourage resistance to such temptation. At Uppingham, however, it has been put quietly aside, because it was in conflict with the idea of justice to each boy. The head-masters and teachers of such a school may not carry away from it the wealth which is often gained from crowded houses and classes, but they will carry away the consciousness of having established a great educational principle, and the knowledge that their system is and will continue to be a standing protest against receiving pay for work which is not and can not be done.

It should be added that, outside of the conclusive reasons just given, Mr. Thring claims that three hundred boys is the limit of numbers that a head-master can know personally, and that to such only can he really be head-master. If he does not know the boys, the master who does is their head-master, and his also.

In passing on to speak of other aspects of Mr. Thring's work at Uppingham, and of his efforts to realize in actual working facts sound theories in education, it would perhaps be well to remind the American reader that the accepted function of the English public school is as much to mold character as to train in-

homes to spend far the greater part of their time, and the character of the home ordinarily is the prime influence in determining the character of the child. Strong personality in a teacher, or exceptional circumstances, may indefinitely intensify the influence of the day-school on character, but as a rule it must be comparatively superficial. It is otherwise with the English public school.

Here a boy has to pass much the greater part of his time during the most impressionable years of his life. His schoolmasters, schoolfellows, and school surroundings are the prime forces in molding his character. He is a member of a small republic, with laws, customs, institutions, ambitions of its own, and where the individual life and the general life react upon each other with singular intensity. To the school come boys from every kind of home: all are to be trained, and the failures should be as few as possible. The responsibility thrown upon the master is enormous; but, on the other hand, his work is infinitely dignified by the opportunity which it furnishes for supreme influence on character. The head-mastership of a school of this type, drawing some hundreds of boys from the better classes of society, furnishes a sufficient field

for the very highest ability, and may enable a man to exercise, in the course of a generation, a perceptible influence on national character.

But while the responsibility for character training as well as intellect training makes the demand for strong men imperative, it increases

is true. "Leisure hours are the key of life," and in a good public school they must be provided for as carefully as any others. Where a school receives some hundreds of boys, each one of whom, stupid or clever, it is intended to train, provision must be made for diversity of taste and ability. This is necessary, because,

THE GREAT SCHOOL-ROOM.

in a tenfold degree the necessity that the machinery of a great school should be as perfect as possible. Mr. Thring's work has largely lain in working out this problem of school structure in its bearing on character training. To his fundamental principle that justice should be done to each boy, he finds a natural corollary in the maxim that high-class work cannot be done over a series of years without good tools. Nothing, he claims, should be left to the ability of the master that can be accomplished by mechanical contrivance. The actual wall of brick or stone which makes discipline easy or vice difficult is a power for good. The fact that during Mr. Thring's mastership about half a million of dollars has been invested at Uppingham in perfecting the school machinery proves that he has in this respect tried to reach his own ideal.

In training the young, plenty of employment is the secret of a healthy moral life. It is not only for the hours of work that this

as every teacher knows, or ought to know, it is essential to the happy life and healthy moral development of a boy that he should always have some field in both work and play where he can maintain his self-respect among his fellows. A lad who has not the capacity to excel in the main studies of a school, or strength to distinguish himself in its hardier sports, may often achieve excellence in minor subjects of study, or acquire skill in other recreative employments. A school is not a perfect training place which has to crush the weak in the process of developing the strong, either at work or at play. It is for these reasons, and in his effort to do justice to each boy, that Mr. Thring, although the staunchest of believers in the preëminent value of classics as an instrument for high intellectual training, was yet among the first to break through the tradition of Eton and the great schools generally by making large provision for other subjects. French and German, science and

mechanics, drawing, painting, and music are thus provided for. On music, especially, much attention is bestowed, for the sake of its humanizing tendency and its power of adding to the happiness of school life. The work of Herr David, the accomplished master of this department, and of his five assistants, is one of the most striking features of Uppingham training. One-third of all the boys in the school learn instrumental music. Every term school concerts are given, which are real musical treats. If any one doubts the power of music to stir the hearts of masses of boys, and lift them to higher levels of thought and work, he should see Herr David controlling the enthusiastic energy of a hundred Uppingham boys as they sing to his music the patriotic song which Mr. Thring, poet of the school as well as head-master, has composed for them, and the spirit of which may be caught from one or two stanzas:

Ho, boys, ho !
 Gather round, together stand,
 Raise a watchword in the land :
 Stand, my merry craftsmen bold,
 Brothers of the crown of gold,
 Wrought in stirring days of old,
 England's crown, the crown of gold.
 Gold of hearts that know no lie,
 Gold of work that does not die,
 Work it new, boys, young and old.
 Gather, gather, near and far,
 Uppingham, hurrah, hurrah !

Ho, boys, ho !
 Fling your banners broad, each fold
 Rich with heirlooms that we hold :
 Honor lent us, as a loan,
 Fields of thought, by others sown,
 Walls, of greatness not our own,
 Where old Time
 In his belfry sits and rings
 News of far-off, holy things,
 Memories of old, old days :
 Sacred melodies of praise
 Swell triumphant, as we raise
 Watchword true in peace or war,
 Uppingham, hurrah, hurrah !

I believe that Uppingham makes fuller provision than any other existing school to meet the necessity for diverse employment or healthy amusement outside of study hours. Until within a few years the great schools mostly contented themselves with providing facilities for cricket and foot-ball. For these ample provision is made at Uppingham in several large playing fields; and the cricketers of the school particularly have won for themselves a record so distinguished as to prove conclusively that exclusive attention to this game is not essential to great success. But Mr. Thring was perhaps the first head-master who fully realized and acted upon the fact that many a boy has not the stamina for these games of strength and skill, nor can he, by any amount of forced

exercise, be led to take pleasure in them. The gymnasium, opened in 1859 under the care of a competent gymnastic master, was the first possessed by any public school in England. For many years the school has had in operation a carpentry, where any boy, by the payment of a small fee, can secure regular and competent instruction in the working of wood and the use of carpenters' tools. In 1882 this field of useful manual occupation was enlarged by the construction of a forge and metal workshop, where skilled instruction is similarly given, and a boy can go far towards making himself a competent mechanical engineer. In the same category may be included the school gardens. These gardens, opened in 1871, cover some acres, and are laid out and planted with much taste. Here a boy may have allotted to him a small plot of ground for the cultivation of plants and flowers. In connection with the gardens is an aviary, where the lad with a taste for natural history has an opportunity to observe the life and habits of a considerable collection of birds. A pretty stone building looking out upon the gardens serves as the school sanitarium, and if beautiful surroundings conduce to health, Uppingham patients ought to recover rapidly. The want of any stream of considerable size near at hand led to the construction, a few years ago, of large swimming-baths, where the boys can perfect themselves in an art which, while it does so much to protect life, is also of great sanitary value.

It will be admitted, I think, that a boy must be of an abnormal type if he cannot in this category find the means of passing pleasantly all his leisure hours. Nor is the provision too elaborate for a great school which aims at training the character of each boy.

There remain to be mentioned two important, and in Mr. Thring's view essential, parts of the school appliances. The first of these is the great school-room, erected at a cost of £7000, and opened in 1863. Here the school can be assembled whenever it is to be dealt with as a whole, for announcements, addresses, the distribution of prizes, matters of general discipline, and for the reception of friends and visitors on great occasions. By such a place of meeting the unity and dignity of a great school are brought out as visible and impressive facts. At Uppingham it is made to serve a further purpose. In accordance with Mr. Thring's idea that the surroundings of school life should be as beautiful as possible, and such as give honor to learning, this room has been decorated with a series of elaborate paintings done under the direction of Mr. Rossiter, chiefly illustrative of the great names in ancient and modern literature. Pre-

THE CHAPEL.

siding at the celebration of Founder's Day in 1882, Earl Carnarvon said of this room: "Since the days of the Painted Porch in Athens, I doubt whether training has ever been installed more lovingly, or more truly, or in a worthier home."

Beside the school-room is the chapel, built after the designs of Mr. Street, at an expense of £8000. Such a chapel, large enough to hold the boys, the masters, and their families, is needed to make a school independent of varying local chances for religious services. The power of preaching to boys effectively is perhaps even a rarer gift than that of teaching them effectively. Mr. Thring's school sermons, of which two volumes have been published, are simple, vigorous, and, as all sermons to boys should be, short—rich in illustrated germs of thought which might well take root in a boy's mind. Bright services, fine music, short, incisive sermons—such associations could scarcely make chapel an unpleasant recollection to an Uppingham boy. But Mr. Thring is too prac-

tical and earnest a man not to feel that in training the young the teaching of Christian theory, to be most efficient, must have its complement of Christian effort. To Uppingham belongs the great honor of having been the first of the public schools to undertake home mission work in the East End of London. Since 1869 it has contributed largely to the maintenance of a missionary in one of the most neglected districts. Better than this, it has found sons of its own ready to volunteer for this work in places where the constant presence of disease and misery tests to the utmost the strength of Christian enthusiasm. Other schools have now followed this example, as well as the two universities, and the movement is one that can scarcely fail of large results. Additional interest is given to this outside work by occasionally sending detachments of the boys with their music masters to the missionary districts in London to give concerts for the benefit of the poor, thus drawing more

closely the bonds of sympathy and humanizing influence. Assuredly in these times of social upheaval no training that boys of the wealthier classes could get can be more useful than one which gives them a closer interest in the mass of poverty and paganism with which modern society has to deal in our great cities. Besides this special work, the school contributes largely to other religious and philanthropic enterprises. Such efforts, systematically carried out, seem to complete the circle of provision for the physical, intellectual, and moral training of the boys.

It must not be supposed that what has been said marks out the school as an unqualified paradise for boys of every stamp. I doubt very much if any effective school can be. My feeling is that for a boy disposed to be fairly industrious and to obey law a happier home could not be found. On the other hand, I can easily imagine that for an idle or vicious lad it might prove singularly uncomfortable, since the individual attention for which provision is

made renders the concealment of shortcomings exceptionally difficult.

Though it is no part of my purpose to write a history of Uppingham, yet one episode in its later career it would be wrong to leave untold, unique as it is in school history, and illustrating at once the energy of its masters, the adaptability of its system to new conditions, and the loyal confidence inspired by its management. The record is valuable also as showing what may be done by a school in a great emergency.

In the autumn of 1875 an outbreak of fever took place in the town and the school, and some boys died. The school was broken up, and orders were given to make the sanitary arrangements of every portion of the school premises as perfect as possible, without regard to expense. This was done under the special direction of a government engineer, who certified to the completeness of the work. The authorities of the town, however, declined to join in this attempt at perfect sanitation. When the school reassembled, after Christmas, a new outbreak of fever proved that till everything was done nothing was done. It was a critical moment. Already it had begun to "rain" telegrams from anxious parents. It was plain that in a few days the houses might be empty, the large staff of teachers left without employment or means of support, and the grand results of twenty-five years of toil swept away at once. A bold step was conceived in Mr. Thring's resolute mind. Once more the school was broken up for a three-weeks' holiday. With the boys went to their parents an

intimation that after Easter the school would reopen in some place then unknown, but which would at least be healthy. Meantime search was being made in many directions, and at length Borth, a small watering-place on the Welsh coast, was chosen as the temporary home of the school. The large summer hotel was leased, all the spare space in the village cottages taken, a temporary school-room erected, the stables turned into a carpentry—the coach-house into a gymnasium; special trains brought from Uppingham the household equipments for 30 masters, their families, and the 300 boys of the school; and on April 4, only 20 days after the site was secured, the school resumed its work on the wild Welsh coast, more than 100 miles from its forsaken home in the Midlands. The splendid faith of the masters in their own resources was rewarded by a grand tribute of confidence, when out of their whole number it was found that only three boys had failed to follow them in this great adventure. The three weeks of fierce race for life were followed by more than a year of quiet and excellent work at Borth, which thenceforth became famed far and wide as "Uppingham by the Sea"; and in April, 1877, the school returned to its now purified home in Rutland, amidst the rejoicings of the people, and with numbers greater than when it left. Among all the splendid traditions of English schools it may be doubted if there is any which tells of greater faith, courage, and loyalty of affection than does this year of adventurous exile in the records of Uppingham.

George R. Parkin.

EDWARD THRING.

THIS was a leader of the sons of light,
 Of winsome cheer and strenuous command.
 Upon the veteran hordes of Bigot-land
 All day his vanguard spirit, flaming bright,
 Bore up the brunt of unavailing fight.
 Then, with the iron in his soul, one hand
 Still on the hilt, he passed from that slim band
 Out through the ranks to rearward and the night.
 The day is lost, but not the day of days,
 And ye his comrades in the losing war
 Stand once again for liberty and love!
 Close up the ranks; his deed your deeds let praise!
 Against the front of dark where gleams one star,
 Strive on to death as this great captain strove!

Bliss Carman.

ABRAHAM LINCOLN: A HISTORY.*

THE MISSISSIPPI AND SHILOH.

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

THE MISSISSIPPI.

As a powerful supplement to the Union victories in Tennessee, the military operations west of the Mississippi River next demand our attention. Under the vigorous promptings of Halleck we left the army of General Curtis engaged in his trying midwinter campaign in south-western Missouri. He made ready with all haste to comply with the order to "push on as rapidly as possible and end the matter with Price." His army obeyed every order with cheerful endurance. "They contend with mud, water, and snow and ice manfully," wrote Curtis under date of February 1, 1862, "and I trust they will not falter in the face of a more active foe." In the same spirit he encouraged his officers:

The roads are indeed very bad, but they are worse for the enemy than for us if he attempts to retreat. . . . The men should help the teams out of difficulty when necessary, and all must understand that the elements are to be considered serious obstacles, which we have to encounter and overcome in this campaign. . . . Constant bad roads will be the rule, and a change for the better a rare exception.

As already remarked, Price had kept his situation and numbers well concealed. He was known to be at Springfield; but rumor exaggerated his force to 30,000, and it was uncertain whether he intended to retreat or advance. Reports also came that Van Dorn was marching to his support with 10,000 men. Curtis kept the offensive, however, pushing forward his outposts. By the 13th of February Price found his position untenable and ordered a retreat from Springfield. Since McCulloch would not come to Missouri to furnish Price assistance, Price was perforce compelled to go to Arkansas, where McCulloch might furnish him protection. Curtis pursued with vigor. "We continually take cattle, prisoners, wagons, and arms, which they leave in their flight," he wrote. Near the Arkansas line Price endeavored to make a stand with his rear-guard, but without success. On February 18, in a special order announcing the recent Union victories elsewhere, Curtis was able to congratulate his own troops as follows:

You have moved in the most inclement weather, over the worst of roads, making extraordinary long marches, subsisting mainly on meat without salt, and for the past six days you have been under the fire of the fleeing enemy. You have driven him out of Missouri, restored the Union flag to the virgin soil of Arkansas, and triumphed in two contests.

The rebels were in no condition to withstand him, and he moved forward to Cross Hollow, where the enemy had hastily abandoned a large cantonment with extensive buildings, only a portion of which they stopped to burn. It was time for Curtis to pause. He was 240 miles from his railroad base at Rolla, where he had begun his laborious march. Orders soon came from Halleck not to penetrate farther into Arkansas, but to hold his position and keep the enemy south of the Boston Mountains. "Hold your position," wrote Halleck, March 7, "till I can turn the enemy." At that date Halleck expected to make a land march along what he had decided to be the central strategic line southward from Fort Donelson, turn the enemy at Memphis, and compel the Confederate forces to evacuate the whole Mississippi Valley down to that point.

There was, however, serious work yet in store for Curtis. To obviate the jealousies and bickerings among Trans-Mississippi Confederate commanders the Richmond authorities had combined the Indian Territory with portions of Louisiana, Arkansas, and Missouri in the Trans-Mississippi District of Department No. II., and had sent Major-General Earl Van Dorn to command the whole. His letters show that he went full of enthusiasm and brilliant anticipations. He did not dream of being kept on the defensive. He called for troops from Arkansas, Louisiana, and Texas, and ordered the armies of McCulloch and McIntosh, and Pike with his Indian regiments, to join him. From these various sources he hoped to collect a force of from 30,000 to 40,000 men at Pocahontas, Arkansas. Unaware that Price was then retreating from Springfield, he wrote to that commander, under date of February 14, proposing a quick and secret march against St. Louis, which he hoped to capture by assault. Holding that city would soon secure Missouri and relieve Johnston, seriously pressed in Tennessee. He

* Copyright by J. G. Nicolay and John Hay, 1886. All rights reserved.

would not wait to prepare, but would adopt the style of frontier equipment and supply:

Flour, salt, and a little bacon in our wagons, and beef cattle driven with us, should be our commissariat. Grain-bags to contain two days' rations of corn, to be carried on our troopers' saddles, and money our paymaster's department, and sufficient ammunition our ordnance department.

But he did not have time enough to extemporize even this haversack campaign: he found his base of supplies menaced from the north-east, and information soon followed that Price was flying in confusion from the north-west. Ten days later we find him writing to Johnston:

Price and McCulloch are concentrated at Cross Hollow. . . . Whole force of enemy [Union] from 35,000 to 40,000; ours about 20,000. Should Pike be able to join, our forces will be about 26,000. I leave this evening to go to the army, and will give battle, of course, if it does not take place before I arrive. I have no doubt of the result. If I succeed, I shall push on.

Van Dorn found the Confederate forces united in the Boston Mountains, fifty-five miles south of Sugar Creek, to which point Curtis had retired for better security. He immediately advanced with his whole force, attacking the Union position on the 6th of March. On the 7th was fought the principal contest, known as the battle of Pea Ridge, or Elkhorn Tavern. As usual, rumor exaggerated the forces on both sides. By the official reports it appears that Van Dorn's available command numbered 16,000. The Union troops under Curtis numbered only about 10,500; but they had the advantage of a defensive attitude and gained a complete victory, to which the vigilance and able strategy of the Union commander effectively contributed. Generals McCulloch, McIntosh, and other prominent rebel officers were killed early in the action, and Van Dorn's right wing was shattered.

The diminished and scattered forces of Van Dorn, retreating by different routes from the battle of Pea Ridge, were not again wholly united. Pike was ordered to conduct his Indian regiments back to the Indian Territory for local duty. The main remnant of the Confederate army followed Van Dorn to the eastward in the direction of Pocahontas, where he proposed to reorganize it, to resume the offensive. Halleck, cautioning Curtis to hold his position and keep well on his guard, speaks of Van Dorn as a "vigilant and energetic officer"; and Van Dorn's language certainly indicates activity, whatever may be thought of the discretion it betrays. He had hardly shaken from his feet the dust of his rout at Pea Ridge when he again began writing that he contemplated relieving the stress of

Confederate disaster in Tennessee by attempting to capture the city of St. Louis, a will-o'-the-wisp project that had by turns dazzled the eyes of all the Confederate commanders in the Mississippi Valley; or, as another scheme, perhaps a mere prelude to this, he would march eastward against Pope and raise the siege of New Madrid, on the Mississippi River. This brings us to a narrative of events at that point.

WITH the fall of Fort Donelson the rebel stronghold at Columbus had become useless. Its evacuation soon followed (March 2, 1862), and the Confederates immediately turned their attention to holding the next barrier on the Mississippi River. This was at a point less than one hundred miles below Cairo, where the Father of Waters makes two large bends, which, joined together, lie like a reversed letter S placed horizontally. At the foot of this first bend lay Island No. 10;* from there the river flows northward to the town of New Madrid, Missouri, passing which it resumes its southward flow. The country is not only flat, as the bend indicates, but it is encompassed in almost all directions by nearly impassable swamps and bayous. Island No. 10, therefore, and its immediate neighborhood, seemed to offer unusual advantages to bar the Mississippi with warlike obstructions. As soon as the evacuation of Columbus was determined upon, all available rebel resources and skill were concentrated here. The island, the Tennessee shore of the river, and the town of New Madrid were all strongly fortified and occupied with considerable garrisons—about 3000 men at the former and some 5000 at the latter place.

General Halleck, studying the strategical conditions of the whole Mississippi Valley with tenfold interest since the victories of Grant, also had his eye on this position, and was now as eager to capture it as the rebels were to defend it. One of the quickest movements of the whole war ensued. General Pope was selected to lead the expedition, and the choice was not misplaced. On the 22d of February, six days after the surrender of Fort Donelson, Pope landed at the town of Commerce, Missouri, on the Mississippi River, with 140 men. On the 28th he was on the march at the head of 10,000, who had been sent him in the interim from St. Louis and Cairo. On the 3d of March, at 1 o'clock in the afternoon, he appeared before the town of New Madrid with his whole force, to which further reinforcements were soon added, raising his army to about 20,000. It would have required but a few hours to cap-

* See communication from John Banvard in "Open Letters" of this number of THE CENTURY.—EDITOR.

ture the place by assault; but the loss of life would have been great and the sacrifice virtually useless. It was the season of the early spring floods; the whole country was submerged, and the great river was at a very high stage between its levees. In addition to its earth-works and its garrison, New Madrid was guarded by a fleet of eight rebel gun-boats under command of Commodore George N. Hollins. The high water floated these vessels at such an elevation that their guns commanded every part of the town, and made its occupation by hostile troops impossible. Had Pope entered with his army, Hollins would have destroyed both town and troops at his leisure.

Pope therefore surrounded the place by siege-works in which he could protect his men; and sending a detachment to Point Pleasant on the river, nine miles below, secured a lodgment for batteries that closed the river to rebel transports and cut off the enemy's reinforcements and supplies. The movement proved effectual. Ten days later (March 13, 1862) the rebels evacuated New Madrid, leaving everything behind.

The Confederates now held Island No. 10 and the Tennessee shore; but their retreat was cut off by the swamps beyond and Pope's batteries below. The rebel gun-boat flotilla had retired down the river. Pope's forces held New Madrid and the Missouri shore, but they had neither transports nor gun-boats, and without these could not cross to the attack. In this dilemma Pope once more called upon Flag-Officer Foote to bring the Union fleet of gun-boats down the river, attack and silence the batteries of Island No. 10, and assist in capturing the rebel army, which his strategy had shut in a trap.

Foote, although commanding a fleet of nine Union gun-boats, objected that the difficulty and risk were too great. With all their formidable strength the gun-boats had two serious defects. Only their bows were protected by the heavier iron plating so as to be shot-proof; and their engines were not strong enough to back easily against the powerful current of the Mississippi. In their attacks on Forts Henry and Donelson they had fought up-stream; when disabled, the mere current carried them out of the enemy's reach. On the Mississippi this was reversed. Compelled to fight down-stream, they would, if disabled, be carried irresistibly directly to the enemy. A bombardment at long range from both gun and mortar boats had proved inef-

fectual to silence the rebel batteries. Pope's expedition seemed destined to prove fruitless, when a new expedient was the occasion of success.

The project of a canal to turn Island No. 10 was again revived. The floods of the Mississippi, pouring through breaks in the levees, inundated the surrounding country. Colonel Bissell of the engineer regiment, returning in a canoe with a guide from his unsuccessful visit to secure Foote's coöperation, learned that a bayou, from two and a half to three miles west of the Mississippi, ran irregularly to the south-west from the neighborhood of Island No. 8, the station of the Union gun-boat flotilla, to its junction with the river at New Madrid, a distance of twelve miles. An open corn-field and an opening in the woods, which marked the course of an old road, suggested to him the possibility of connecting the river with the bayou; but between the end of the road and the bayou lay a belt of heavy timber two miles in width.* How could he get a fleet of vessels over the ground thickly covered by trees of every size, from a sapling to a forest veteran three feet in diameter, whose roots stood six or seven feet under water? Modern mechanical appliances are not easily baffled by natural obstacles. Six hundred skillful mechanics working with the aid of steam and machinery, and directed by American inventive ingenuity, brought the wonder to pass. In a few days Colonel Bissell had a line of four light-draught steamboats and six coal-barges† crossing the corn-field and entering the open road. Great saws, bent in the form of an arc and fastened to frames swinging on pivots, severed the tree-trunks four and a half feet under water; ropes, pulleys, and capstans hauled the encumbering débris out of the path. In eight days the amphibious fleet was in the bayou. Here were new difficulties—to clean away the dams of accumulated and entangled drift-wood. In a few days more Bissell's boats and barges were ready to emerge into the Mississippi at New Madrid, but yet kept prudently concealed. Two gun-boats were needed to protect the transports in crossing troops. The sagacious judgment of Foote and the heroism of his subordinates supplied these at the opportune moment. Captain Walke of the *Carondelet* volunteered to run the batteries at Island No. 10; and now that the risk was justified, the flag-officer consented. On the night of the 4th of April, after the moon had gone down, the gun-boat *Carondelet*, moving with as little noise as

* J. W. Bissell, "Battles and Leaders of the Civil War."

† The barges used were coal-barges, about eighty feet long and twenty wide, scow-shaped, with both

ends alike. The sides were six inches thick, and of solid timber. [J. W. Bissell, "Battles and Leaders of the Civil War."]

possible, swung into the stream from her moorings and started on her perilous voyage. It must have seemed an omen of success that a sudden thunder-storm with its additional gloom and noise came up to aid the attempt. The movement was unsuspected by the enemy till, by one of frequent flashes of lightning, the rebel sentries on the earth-works of Island No. 10 and the shore batteries opposite saw the huge turtle-shaped river craft stand out in vivid outline, to be in a second hidden again by the dense obscurity. Alarm cries rang out, musketry rattled, great guns resounded; the ship almost touched the shore in the drift of the crooked channel. But the Confederate guns could not be aimed amidst the swift succession of brilliant flash and total darkness. The rebel missiles flew wild, and a little after midnight the *Carondelet* lay unharmed at the New Madrid landing. Captain Walke had made the first successful experiment in a feat of daring and skill that was many times repeated after he had demonstrated its possibility.

The gun-boat *Pittsburgh*, also running past the rebel batteries at night, joined the *Carondelet* at New Madrid on the morning of April 7, and the problem of Pope's difficulties was solved. When he crossed his troops over the river by help of his gun-boats and transports, formidable attack was no longer necessary. Island No. 10 had surrendered to Flag-Officer Foote that morning, and the several rebel garrisons were using their utmost endeavors to effect a retreat southward. Pope easily intercepted their movement: on that and the following day he received the surrender of three general officers and six or seven thousand Confederate troops.

As General Pope's victory had been gained without loss or demoralization, he prepared immediately to push his operations farther south. "If transportation arrives to-morrow or next day," telegraphed Assistant-Secretary Scott, who was with him at New Madrid, "we shall have Memphis within ten days." Halleck responded with the promise of ten large steamers to carry troops, and other suggestions indicating his approval of the movement "down the river." In the same dispatch Halleck gave news of the Union victory at Pittsburgh Landing on the Tennessee River, and announced his intention to proceed thither, and asked Assistant-Secretary Scott to meet him at Cairo for consultation. The meeting took place on the 10th of April, by which time Halleck had become more impressed with the severity and the perils of the late battle on the Tennessee; for Scott asks the Washington authorities whether a reinforcement of 20,000 or 30,000 men cannot be sent from the East to make good the loss. This conference proba-

bly originated the idea that soon interrupted the successful river operations, by withdrawing the army under Pope. Reinforcements could not be spared from the East, and Pope's army became the next resource. For the present, however, there was a continuation of the first plan. Pope's preliminary orders for embarkation were issued on the 10th, and on the 14th the combined land and naval forces which had reduced Island No. 10 reached Fort Pillow. Its works were found to be strong and extensive. The overflow of the whole country rendered land operations difficult; it was estimated that it would require two weeks to turn the position and reduce the works. Meanwhile information was obtained that Van Dorn's rebel army from Arkansas was about to reinforce Beauregard at Corinth. In view of all this, Assistant-Secretary Scott asked the question: "If General Pope finds, after careful examination, that he cannot capture Fort Pillow within ten days, had he not better reinforce General Halleck immediately, and let Commodore Foote continue to blockade below until forces can be returned and the position be turned by General Halleck beating Beauregard and marching upon Memphis from Corinth?" Before an answer came from the War Department at Washington, Halleck, who had for several days been with the army on the Tennessee River, decided the question for himself and telegraphed to Pope (April 15), "Move with your army to this place, leaving troops enough with Commodore Foote to land and hold Fort Pillow, should the enemy's forces withdraw." At the same time he sent the following suggestion to Flag-Officer Foote:-

I have ordered General Pope's army to this place, but I think you had best continue the bombardment of Fort Pillow; and if the enemy should abandon it, take possession or go down the river, as you may deem best. General Pope will leave forces enough to occupy any fortifications that may be taken.

The plan was forthwith carried into effect. The transports, instead of disembarking Pope's troops to invest Fort Pillow, were turned northward, and steaming up the Mississippi to Cairo, thence to Paducah, and from Paducah up the Tennessee River, landed the whole of Pope's army, except two regiments, at Pittsburgh Landing on the 22d of April.

The flotilla under Foote and the two regiments left behind continued in front of Fort Pillow, keeping up a show of attack, by a bombardment from one of the mortar-boats and such reconnaissances as the little handful of troops could venture, to discover, if possible, some weak point in the enemy's defenses. On the other hand, the Confederates, watching what they thought a favorable opportunity,

brought up eight of their gun-boats and made a spirited attack on the Union vessels on the morning of May 10. In a short combat two of the Union gun-boats, which bore the brunt of the onset, were seriously disabled, though not until they had inflicted such damage on three Confederate vessels that they drifted helplessly out of the fight; after which the remainder of the rebel flotilla retired from the encounter. For nearly a month after this preliminary gun-boat battle the river operations, though full of exciting daily incident, were marked by no important historical event. Mention, however, needs to be here made of a change in the control of the Union fleet. Commodore Foote had been wounded in the ankle during his attack on Fort Donelson, and his injury now caused him so much suffering and exhaustion of strength that he was compelled to relinquish his command. He took leave of his flotilla on the 9th of May, and was succeeded by Commodore Charles H. Davis, who from that time onward had charge of the gun-boat operations on the upper Mississippi.

THE SHILOH CAMPAIGN.

THE fall of Fort Donelson hastened, almost to a panic, the retreat of the Confederates from other points. By that surrender about one-third of their fighting force in Tennessee vanished from the campaign, while their whole web of strategy was instantly dissolved. The full possession of the Tennessee River by the Union gun-boats for the moment hopelessly divided the Confederate commands, and like a flushed covey of birds the rebel generals started on their several lines of retreat without concert or rallying point. Albert Sidney Johnston, the department commander, moved south-east towards Chattanooga, abandoning Nashville to its fate; while Beauregard, left to his own discretion and resources, took measures to effect the evacuation of Columbus so as to save its armament and supplies, and then proceeded to the railroad crossings of northern Mississippi to collect and organize a new army.

It is now evident that if the Union forces could have been promptly moved forward in harmonious combination, with the facility which the opening of the Tennessee River afforded them, such an advance might have been made, and such strategic points gained and held, as would have saved at least an entire year of campaign and battle in the West. Unfortunately this great advantage was not seized, and in the condition of affairs could not be; and a delay of a fortnight or more enabled the insurgents to renew the confidence and gather the forces to establish another line

farther to the south, and again to interpose a formidable resistance. One cause of this inefficiency and delay of the Union commanders may be easily gleaned from the dispatches interchanged by them within a few days succeeding the fall of Fort Donelson, and which, aside from their military bearings, form an interesting study of human nature.

General Buell, from his comfortable headquarters at Louisville, writes (February 17, 1862) that since the reinforcements (Nelson's division) started by him to assist at Fort Donelson are no longer needed, he has ordered them back. "The object of both our forces," he continues, "is, directly or indirectly, to strike at the power of the rebellion in its most vital point within our field. Nashville appears clearly, I think, to be that point." He thought further that heavy reinforcements would soon be thrown into it by the rebels. The leisurely manner in which he expected to strike at this heart of the rebellion appears from these words, in the same letter:

To depend on wagons at this season for a large force seems out of the question, and I fear it may be two weeks before I can get a bridge over the Barren River, so as to use the railroad beyond. I shall endeavor, however, to make an advance in less or much force before that time. . . . Let me hear your views.

Halleck, at St. Louis, was agitated by more rapid emotions. Watching the distant and dangerous campaign under Curtis in south-western Missouri, beginning another of mingled hazard and brilliant promise under Pope on the Mississippi, beset by perplexities of local administration, flushed to fever heat by the unexpected success of Grant, his mind ran forward eagerly to new prospects. "I am not satisfied with present success," he telegraphed Sherman. "We must now prepare for a still more important movement. You will not be forgotten in this." But this preparation seems, in his mind, to have involved something more than orders from himself.

Before he received the news of the surrender of Fort Donelson he became seriously alarmed lest the rebels, using their river transportation, might rapidly concentrate, attack Grant in the rear, crush him before succor could reach him, and, returning quickly, be as ready as before to confront and oppose Buell. Even after the surrender Halleck manifests a continuing fear that some indefinite concentration will take place, and a quick reprisal be executed by a formidable expedition against Paducah or Cairo. His overstrained appeals to Buell for help do not seem justified in the full light of history. An undertone of suggestion and demand indicates that this urgency, ostensibly based on his patriotic eagerness for success, was not wholly free from personal ambition.

We have seen how when he heard of Grant's victory he generously asked that Buell, Grant, and Pope be made major-generals of volunteers, and with equal generosity to himself broadly added, "and give me command in the West." He could not agree with Buell that Nashville was the most vital point of the rebellion in the West, and that heavy rebel reinforcements would be thrown into it from all quarters east and south. Halleck develops his idea with great earnestness in replying to that suggestion from Buell. He says:

To remove all questions as to rank, I have asked the President to make you a major-general. Come down to the Cumberland and take command. The battle of the West is to be fought in that vicinity. You should be in it as the ranking general in immediate command. Don't hesitate. Come to Clarksville as rapidly as possible. Say that you will come, and I will have everything there for you. Beauregard threatens to attack either Cairo or Paducah; I must be ready for him. Don't stop any troops ordered down the Ohio. We want them all. You shall have them back in a few days. Assistant-Secretary of War Scott left here this afternoon to confer with you. He knows my plans and necessities. I am terribly hard pushed. Help me, and I will help you. Hunter has acted nobly, generously, bravely. Without his aid I should have failed before Fort Donelson. Honor to him. We came within an ace of being defeated. If the fragments which I sent down had not reached there on Saturday we should have gone in. A retreat at one time seemed almost inevitable. All right now. Help me to carry it out. Talk freely with Scott. It is evident to me that you and McClellan did not at last accounts appreciate the strait I have been in. I am certain you will when you understand it all. Help me, I beg of you. Throw all your troops in the direction of the Cumberland. Don't stop any one ordered here. You will not regret it. There will be no battle at Nashville.

In answer to an inquiry from Assistant-Secretary Scott, he explains further:

I mean that Buell should move on Clarksville with his present column: there unite his Kentucky army and move up the Cumberland, while I act on the Tennessee. We should then be able to coöperate.

This proposal was entirely judicious; but in Halleck's mind it was subordinated to another consideration, namely: that he should exercise superior command in the West. Again he telegraphed to McClellan (February 19), "Give it [the Western division] to me, and I will split secession in twain in one month." The same confidence is also expressed to Buell, in a simultaneous dispatch to Assistant-Secretary Scott, who was with Buell. "If General Buell will come down and help me with all possible haste we can end the war in the West in less than a month." A day later Halleck becomes almost peremptory in a dispatch to McClellan: "I must have command of the armies in the West. Hesitation and delay are losing us the golden opportunity. Lay this before the President and Secretary of War. May I assume the command? Answer quickly."

To this direct interrogatory McClellan replied in the negative. The request, to say the least of it, was somewhat presumptuous, and hardly of proper tone to find ready acquiescence from a military superior. In this case, however, it was also calculated to rouse a twofold instinct of jealousy. Buell was a warm personal friend of McClellan, and the latter could not be expected to diminish the opportunities or endanger the chances of his favorite. But more important yet was the question how this sudden success in Halleck's department, and the extension of command and power so boldly demanded, might affect McClellan's own standing and authority. He was yet General-in-Chief, but the Administration was dissatisfied at his inaction, and the President had already indicated, in the general war order requiring all the armies of the United States to move on the 22d of February, that his patience had a limit. McClellan did not believe that the army under his own immediate care and command would be ready to fulfill the President's order. Should he permit a rival to arise in the West and grasp a great victory before he could move?

An hour after midnight McClellan answered Halleck as follows:

Buell at Bowling Green knows more of the state of affairs than you at St. Louis. Until I hear from him I cannot see necessity of giving you entire command. I expect to hear from Buell in a few minutes. I do not yet see that Buell cannot control his own line. I shall not lay your request before the Secretary until I hear definitely from Buell.

Halleck did not feel wholly baffled by the unfavorable response. That day he received a dispatch from Stanton, who said:

Your plan of organization has been transmitted to me by Mr. Scott and strikes me very favorably, but on account of the domestic affliction of the President I have not yet been able to submit it to him. The brilliant result of the energetic action in the West fills the nation with joy.

Encouraged by this friendly tone from the Secretary of War, Halleck ventured a final appeal:

One whole week has been lost already by hesitation and delay. There was, and I think there still is, a golden opportunity to strike a fatal blow, but I can't do it unless I can control Buell's army. I am perfectly willing to act as General McClellan dictates or to take any amount of responsibility. To succeed we must be prompt. I have explained everything to General McClellan and Assistant-Secretary Scott. There is not a moment to be lost. Give me authority and I will be responsible for results.

Doubtless Halleck felt that the fates were against him, for the reply chilled his lingering hopes:

Your telegram of yesterday, together with Mr. Scott's reports, have this morning been submitted to the Pres-

ident, who, after full consideration of the subject, does not think any change in the organization of the army or the military departments at present advisable. He desires and expects you and General Buell to coöperate fully and zealously with each other, and would be glad to know whether there has been any failure of coöperation in any particular.

Mr. Lincoln had been watching by the bedside of his dying son, and in his overwhelming grief probably felt disinclined to touch this new vexation of military selfishness—a class of questions from which he always shrank with the utmost distaste; besides, we shall see in due time how the President's momentary decision turned upon much more comprehensive changes already in contemplation.

Before McClellan's refusal to enlarge Halleck's command, he had indicated that his judgment and feelings were both with Buell. Thus he telegraphed the latter on February 20:

Halleck says Columbus reënforced from New Orleans, and steam up on their boats ready for move—probably on Cairo. Wishes to withdraw some troops from Donelson. I tell him improbable that rebels are reënforced from New Orleans or attack Cairo. Think [they] will abandon Columbus. . . . How soon can you be in front of Nashville, and in what force? What news of the rebels? If the force in West can take Nashville, or even hold its own for the present, I hope to have Richmond and Norfolk in from three to four weeks.

He sent a similar dispatch to Halleck, in which he pointed out Nashville as the pressing objective:

Buell has gone to Bowling Green. I will be in communication with him in a few minutes, and we will then arrange. The fall of Clarksville confirms my views. I think Cairo is not in danger, and we must now direct our efforts on Nashville. The rebels hold firm at Manassas. In less than two weeks I shall move the army of the Potomac, and hope to be in Richmond soon after you are in Nashville. I think Columbus will be abandoned within a week. We will have a desperate battle on this line.

While the three generals were discussing high strategy and grand campaigns by telegraph, and probably deliberating with more anxiety the possibilities of personal fame, the simple soldiering of Grant and Foote was solving some of the problems that confused scientific hypothesis. They quietly occupied Clarksville, which the enemy abandoned; and even while preparing to do so, Grant suggested in his dispatch of February 19, "If it is the desire of the general commanding department, I can have Nashville on Saturday week." Foote repeated the suggestion in a dispatch of February 21, but the coveted permission did not come in time.

Meanwhile Buell, having gone to Bowling Green to push forward his railroad bridge, and hearing of the fall of Clarksville and the prob-

able abandonment of Nashville, moved on by forced marches with a single division, reaching the Cumberland opposite the city on the 25th. The enemy had burned the bridge and he could not cross; but almost simultaneously he witnessed the arrival of steamboats bringing General Nelson's division, which immediately landed and occupied the place. This officer and his troops, after several varying orders, were finally sent up the Cumberland to Grant, and ordered forward by him to occupy Nashville and join Buell. It was a curious illustration of dramatic justice that the struggle of the generals over the capture of the place should end in the possession of Nashville by the troops of Buell under the orders of Grant, whose name had not once been mentioned by the contending commanders.

For a few days succeeding the occupation of Nashville news and rumors of what the rebels were doing were very conflicting, and none of the Union commanders suggested any definite campaign. On February 26 Halleck ordered preparations for a movement up either the Tennessee or the Cumberland, as events might require; but for two days he could not determine which. Finally, on the 1st of March, he sent distinct orders to Grant to command an expedition up the Tennessee River, to destroy the railroad and cut the telegraph at Eastport, Corinth, Jackson, and Humboldt. This was to be, not a permanent army advance, but a temporary raid by gun-boats and troops on transports; all of which, after effecting what local destruction they could, were to return—the whole movement being merely auxiliary to the operations then in progress against New Madrid and Island No. 10, designed to hasten the fall of Columbus. It turned out that the preparations could not be made as quickly as Halleck had hoped; the delay arising, not from the fault or neglect of any officer, but mainly from the prevailing and constantly increasing floods in the Western waters, and especially from damage to telegraph lines that seriously hindered the prompt transmission of communications and orders. Out of this latter condition there also grew the episode of a serious misunderstanding between Halleck and Grant, which threatened to obscure the new and brilliant fame which the latter was earning.

Only a moment of vexation and ill temper can account for the harsh accusation Halleck sent to Washington, that Grant had left his post without leave, that he had failed to make reports, that he and his army were demoralized by the Donelson victory. Reply came back that generals must observe discipline as well as privates. "Do not hesitate to arrest him [Grant] at once," added McClellan, "if

the good of the service requires it, and place C. F. Smith in command." Halleck immediately acted on the suggestion, ordered Grant to remain at Fort Henry, and gave the proposed Tennessee expedition to Smith. Grant obeyed, and at first explained, with an admirable control of temper, that he had not been in fault. Later on, however, feeling himself wronged, he several times asked to be relieved from duty. By this time Halleck was convinced that he had unjustly accused Grant and as peremptorily declined to relieve him, and ordered him to resume his former general command. "Instead of relieving you," he added, "I wish you, as soon as your new army is in the field, to assume the immediate command and lead it on to new victories." In truth, while neither general had been unjust by intention, both had been blamable in conduct. Grant violated technical discipline in leaving his command without permission; Halleck, with undue haste, preferred an accusation which further information proved to be groundless. It is to the credit of both that they dismissed the incipient quarrel and with new zeal and generous confidence immediately joined in hearty public service.

While the Grant-Halleck controversy and preparations for the Tennessee River expedition were both still in progress, the military situation was day by day slowly defining itself, though as yet without very specific action or conclusion. Buell, becoming satisfied that the enemy had no immediate intention to return and attack him at Nashville, inquired on March 3 of Halleck: "What can I do to aid your operations against Columbus?" To this Halleck replied on the 4th with the information that Columbus had been evacuated, and asked, "Why not come to the Tennessee and operate with me to cut Johnston's line with Memphis, Randolph, and New Madrid?" Without committing himself definitely, Buell answered on the 6th, merely proposing that they should meet at Louisville to discuss details. Halleck, however, unable to spare the time, held tenaciously to his proposition, informing Assistant-Secretary Scott, at Cairo, of the situation in these words:

I telegraphed to General Buell to reënforce me as strongly as possible at or near Savannah [Tennessee]. Their line of defense is now an oblique one, extending from Island No. 10 to Decatur or Chattanooga. Having destroyed the railroad and bridges in his rear, Johnston cannot return to Nashville. We must again pierce his center at Savannah or Florence. Buell should move immediately, and not come in too late, as he did at Donelson.

Feeling instinctively that he could get no effective voluntary help from Buell, Halleck turned again to McClellan, informing him of

his intended expedition up the Tennessee River, that he had directed a landing to be made at Savannah, that he had sent intrenching tools, and would push forward reënforcements as rapidly as possible. On the following day, however, reporting the strength of Grant's forces, he said: "You will perceive from this that without Buell's aid I am too weak for operations on the Tennessee." The information received by him during the next twenty-four hours that Curtis had won a splendid victory at the battle of Pea Ridge in Arkansas made a favorable change in his resources, and he explains his views and intentions to McClellan with more confidence:

Reserves intended to support General Curtis will now be drawn in as rapidly as possible and sent to the Tennessee. I propose going there in a few days. That is now the great strategic line of the Western campaign, and I am surprised that General Buell should hesitate to reënforce me. He was too late at Fort Donelson, as Hunter has been in Arkansas. I am obliged to make my calculations independent of both. Believe me, general, you make a serious mistake in having three independent commands in the West. There never will and never can be any coöperation at the critical moment; all military history proves it. You will regret your decision against me on this point. Your friendship for individuals has influenced your judgment. Be it so. I shall soon fight a great battle on the Tennessee unsupported, as it seems; but if successful, it will settle the campaign in the West.

We may also conclude that another element of the confidence that prompted his language was the intimation lately received from the Secretary of War, who three days before had asked him to state "the limits of a military department that would place all the Western operations you deem expedient under your command." In fact, events in the East as well as in the West were culminating that rather suddenly ended existing military conditions. The naval battle between the *Merrimac* and the *Monitor*, and the almost simultaneous evacuation of Manassas Junction by the rebel forces in Virginia, broke the long inactivity of the Army of the Potomac.

We cannot better illustrate how intently Mr. Lincoln was watching army operations, both in the East and the West, than by quoting his dispatch of March 10 to Buell:

The evidence is very strong that the enemy in front of us here is breaking up and moving off. General McClellan is after him. Some part of the force may be destined to meet you. Look out, and be prepared. I telegraphed Halleck, asking him to assist you if needed.

McClellan's aimless march to capture a few scarecrow sentinels and quaker guns in the deserted rebel field-works, which had been his nightmare for half a year, afforded the opportunity for a redistribution of military leader-

ships, which the winter's experience plainly dictated. Slow and cautious in maturing his decisions, President Lincoln was prompt to announce them when they were once reached. On the 11th of March he issued his War Order No. 3, one of his most far-reaching acts of military authority. It relieved McClellan from the duties of General-in-Chief of all the armies, and sent him to the field charged with the single object of conducting the campaign against Richmond. This made possible a new combination for the West, and the same order united the three Western departments (as far east as Knoxville, Tennessee) under the command of Halleck. Under this arrangement was fought the great battle on the Tennessee that Halleck predicted, giving the Union arms a victory the decisive influence of which was felt throughout the remainder of the war; a success, however, due mainly to the gallantry of the troops, and not to any genius or brilliant generalship of Halleck or his subordinate commanders.

The Tennessee River expedition under Smith, which started on March 10, made good its landing at Savannah, and on the 14th Smith sent Sherman with a division on nineteen steamboats, preceded by gun-boats, to ascend the river towards Eastport and begin the work of destroying railroad communications, which had been the original object of the whole movement. Sherman made a landing to carry out his orders; but this was the season of spring freshets. A storm of rain and snow changed every ravine and rivulet to a torrent; the Tennessee River rose fifteen feet in twenty-four hours, covering most steamboat landings with deep water; and the intended raid by land and water was reduced to a mere river reconnaissance, which proved the enemy to be in considerable force about Iuka and Corinth, covering and guarding the important railroad crossings and communications. Sherman felt himself compelled to return to Pittsburg Landing, on the west bank of the Tennessee, nine miles above Savannah, which was on the east bank. The place was already well known to both armies, for a skirmish had occurred there on the 1st of March between Union gun-boats and a rebel regiment.

It would seem that General Smith had fixed upon Pittsburg Landing as an available point from which to operate more at leisure upon the enemy's railroad communications, and hence had already sent Hurlbut's division thither, which Sherman found there on his return. The place was not selected as a battle-field, nor as a base of operations for a campaign, but merely to afford a temporary lodgment for raids upon the railroads. By a silent and gradual change of conditions, however,

the intention and essential features of the whole Tennessee River movement underwent a complete transformation. What was begun as a provisional expedition became a strategic central campaign; and what was chosen for an outpost of detachments was almost imperceptibly turned into a principal point of concentration, and became, by the unexpected assault of the enemy, one of the hardest-fought battle-fields of the whole war.

Halleck assumed command of his combined departments by general orders dated March 13, and after explaining once more to Buell that all his available force not required to defend Nashville should be sent up the Tennessee, he telegraphed him on the 16th of March:

Move your forces by land to the Tennessee as rapidly as possible. . . . Grant's army is concentrating at Savannah. You must direct your march on that point so that the enemy cannot get between us.

The combined campaign thus set in motion was wise in conception, but its preliminary execution proved lamentably weak; and the blame is justly attributable, in about equal measure, to Halleck, Buell, and Grant. For a few days Halleck's orders were decided and firm; then there followed a slackening of opinion and a variance of direction that came near making a disastrous wreck of the whole enterprise. His positive orders to Buell to move as rapidly as possible and to concentrate at Savannah were twice repeated on the 17th; but on the 26th he directed him to concentrate at Savannah or Eastport, and on the 29th to concentrate at Savannah or Pittsburg, while on April 5 he pointedly consented to a concentration at Waynesborough. This was inexcusable uncertainty in the combinations of a great strategist, who complained that "hesitation and delay are losing us the golden opportunity." These were the timid steps of a blind man feeling his way, and not the firm strides of a leader who promised to "split secession in twain in one month."

It can hardly be claimed that Buell's march fulfilled the injunction to move "as rapidly as possible." When his advanced division reached Duck River at Columbia on the 18th it found that stream swollen and the bridge destroyed, and set itself to the task of building a new frame bridge with a deliberateness better befitting the leisure of peace than the pressing hurry of war. Buell arrived in person at Columbia on the 26th.* He manifested his own dissatisfaction with the delay by ordering the construction of another bridge, this time of pontoons, which was completed simultaneously with the first on March 30.

* Buell in "Battles and Leaders of the Civil War," Vol. I., p. 491.

Still further delay was projected by a proposition to halt for concentration at Waynesborough. It must be said in justice to Buell, that Halleck did not complain of the slow bridge-building at Columbia, and that he consented to the concentration at Waynesborough. Had it taken place, Buell's army would again have been "too late" for a great battle. The excuse offered, that Buell supposed the Union army to be safe on the east bank of the Tennessee at Savannah, can scarcely be admitted; for on the 23d Buell received a letter from Grant which said:

I am massing troops at Pittsburg, Tennessee. There is every reason to suppose that the rebels have a large force at Corinth, Mississippi, and many at other points on the road towards Decatur.

This information, which Buell considered of no importance, appears to have excited the serious attention of General William Nelson, one of Buell's division commanders, who, already impatient at the tardy bridge-building, read the signs of danger in the conditions about him with a truer military instinct. Nelson finally obtained permission to ford the now falling waters of Duck River, crossed his division on the 29th and 30th, and began the march over the ninety miles remaining to be traversed with an enthusiasm and impetuosity that swept the whole army past the proposed halting-place at Waynesborough, bringing his own division to Savannah on the 5th, and others on the 6th, of April.

It reflects no credit on General Halleck or General Grant that during the interim of Buell's march the advanced post of Pittsburg Landing had been left in serious peril. Halleck was busy at St. Louis collecting reinforcements to send to Grant, with the announced intention to proceed to the field and take personal command on the Tennessee River. This implied a delay demanding either the concentration of the whole army at Savannah, as originally ordered by him, behind the safe barrier of the Tennessee, or strong fortifications for the exposed position of Pittsburg Landing, on the west bank. On the other hand, Grant, resuming his general command in person on March 17, and finding his five divisions separated, three at Savannah and two at Pittsburg Landing,—nine miles apart, with a river between them,—properly took alarm and immediately united them; but in doing this he committed the evident fault of defying danger by choosing the advanced position and of neglecting to raise the slightest intrenchments to protect his troops—which were without means of rapid retreat—against a possible assault from an enemy only twenty miles distant, and according to his own reports at all times his equal if not his superior in numbers. But

one cause can be assigned for this palpable imprudence. Well instructed in the duties of an officer under orders, he was just beginning his higher education as a leader of armies, and he was about to receive the most impressive lesson of his very strange career.

It has been already stated that after the fall of Fort Donelson the rebel commanders fled southward in confusion and dismay. We have the high authority and calm judgment of General Grant, in the mature experience and reflection of after years, that "if one general who would have taken the responsibility had been in command of all the troops west of the Alleghanies, he could have marched to Chattanooga, Corinth, Memphis, and Vicksburg with the troops we then had";* but the Secessionists of the South-west were still in the fervor of their early enthusiasm, and recovered rapidly from the stupefaction of unexpected disaster. In the delay of four or five weeks that the divided ambition and over-cautious hesitation of the Union generals afforded them, they had renewed their courage, and united and reinforced their scattered armies. The separation of the armies of Johnston from those of Beauregard, which seemed irreparable when the Tennessee River was opened, had not been maintained by the prompt advance that everybody pointed out but which nobody executed. By the 23d of March the two Confederate generals had once more, without opposition, effected a junction of their forces at and about Corinth, and thus reversed the pending military problem. In the last weeks of February it could have been the united Unionists pursuing the divided Confederates. In the last weeks of March it was the united Confederates preparing to attack the divided armies of Halleck and Buell. The whole situation and plan is summed up in the dispatch of General Albert Sidney Johnston to Jefferson Davis, dated April 3, 1862:

General Buell is in motion, 30,000 strong, rapidly from Columbia by Clifton to Savannah; Mitchell behind him with 10,000. Confederate forces, 40,000, ordered forward to offer battle near Pittsburg. Division from Bethel, main body from Corinth, reserve from Burnsville converge to-morrow near Monterey on Pittsburg. Beauregard second in command; Polk, left; Hardee, center; Bragg, right wing; Breckinridge, reserve. Hope engagement before Buell can form junction.

The Confederate march took place as projected, and on the evening of April 5 their joint forces went into bivouac two miles from the Union camps. That evening also the Confederate commanders held an informal conference. Beauregard became impressed with impending defeat; their march had been slow, the rations they carried were exhausted, and

* Grant, "Personal Memoirs," Vol. I., p. 317.

their extra rations and ammunition were not yet at hand. They could no longer hope to effect the complete surprise that was an essential feature of their plan. Beauregard advised a change of programme—to abandon the projected attack and convert the movement into a “reconnaissance in force.” General Johnston listened, but refused his assent, and orders were given to begin the battle next morning. No suspicion of such a march or attack entered the mind of any Union officer; and that same day Grant reported to Halleck, “The main force of the enemy is at Corinth.”

The natural position occupied by the Union forces is admitted to have been unusually strong. The Tennessee River here runs nearly north. North of the camps, Snake Creek with an affluent, Owl Creek, formed a barrier stretching from the river bank in general direction towards the south-west. South of the camps, Lick Creek and river sloughs also formed an impassable obstruction for a considerable distance next to the Tennessee. The river on the east, and Snake and Owl creeks on the west, thus inclosed a high triangular plateau with sides three or four miles in length, crossed and intersected to some extent by smaller streams and ravines, though generally open towards the south. The roads from Pittsburg Landing towards Corinth followed the main ridge, also towards the south-west. A network of other roads, very irregular in direction, ran from the Corinth roads to various points in the neighborhood. Alternate patches of timber, thick undergrowth, and open fields covered the locality. Two miles from Pittsburg Landing, on one of the Corinth roads, stood a log meeting-house, called Shiloh Church, which was destined to become the center of the battle-field and to give its name to the conflict.

Three of Grant's divisions were camped in an irregular line from Lick Creek to Owl Creek, closing the open side of the triangular plateau—Sherman's division in the center, near Shiloh Church; Prentiss to his left, towards the Tennessee River and somewhat in advance; McClelland to the right, towards Owl Creek and somewhat in rear. Half-way back from Shiloh Church to Pittsburg Landing were camped the divisions of Hurlbut and of Smith, the latter now commanded—owing to Smith's illness—by W. H. L. Wallace. Another division, under General Lew. Wallace, had been left at Crump's Landing, six miles to the north, as a guard against rebel raids, which threatened to gain possession of the banks of the Tennessee at that point to destroy the river communications. Grant had apprehensions of a raid of this character and cautioned his officers against it, an admoni-

tion that was the basis of such alertness and vigilance as had existed for several days.

Most of the particulars of the battle that followed will probably always form a subject of dispute. There were no combined or dramatic movements of masses that can be analyzed and located. The Union army had no prepared line of defense; three lines in which the rebel army had been arranged for the attack became quickly broken and mingled with one another. On the Union side the irregular alignment of the camps and the precipitancy of the attack compelled the formation of whatever line of battle could be most hurriedly improvised. General Force says:

A combat made up of numberless separate encounters of detached portions of broken lines, continually shifting position and changing direction in the forest and across ravines, filling an entire day, is almost incapable of a connected narrative.

At 5 o'clock on the morning of Sunday, April 6, 1862, the rebel lines moved forward to the attack. The time required to pass the intervening two miles, and the preliminary skirmishes with Union pickets and a reconnoitering Union regiment that began the fight, gradually put the whole Union front on the alert; and when the main lines closed with each other, the divisions of Prentiss, Sherman, and McClelland were sufficiently in position to offer a stubborn resistance. The Confederates found themselves foiled in the easy surprise and confusion that they had counted upon. It would be a tedious waste of time to attempt to follow the details of the fight, which, thus begun before sunrise, continued till near sunset.

Along the labyrinth of the local roads, over the mixed patchwork of woods, open fields, and almost impenetrable thickets, across stretches of level, broken by miry hollows and abrupt ravines, the swinging lines of conflict moved intermittently throughout the entire day. There was onset and repulse, yell of assault and cheer of defiance, screeching of shells and sputtering of volleys, advance and retreat. But steadily through the fluctuating changes the general progress was northward, the rebels gaining and pushing their advance, the Unionists stubbornly resisting, but little by little losing their ground. It was like the flux and reflux of ocean breakers, dashing themselves with tireless repetition against a yielding, crumbling shore. Beauregard, to whom the Confederate commander had committed the general direction of the battle, several times during the day advanced his headquarters from point to point, following the steady progress of his lines. The time consumed and the lists of dead and wounded are sufficient evidence of the brave conduct of officers and

the gallant courage of men on both sides. On the Union side the divisions of Hurlbut and W. H. L. Wallace had early been brought forward to sustain those of Prentiss, Sherman, and McClernand. It was, to a degree seldom witnessed in a battle, the slow and sustained struggle, through an entire day, of one whole army against another whole army. The five Union divisions engaged in the battle of Sunday numbered 33,000.* The total force of the Confederates attacking them was 40,000.

It was in the latter half of the afternoon that the more noteworthy incidents of the contest took place. The first of these was the death of the Confederate commander, General Albert Sidney Johnston, who fell personally leading the charge of a brigade.† The knowledge of the loss was carefully kept from the Confederate army, and the management on their side of the conflict was not thereby impaired, because Beauregard had been mainly intrusted with it from the beginning. About 5 o'clock in the afternoon a serious loss fell upon the Unionists. General Prentiss, commanding the Sixth Division, and General W. H. L. Wallace, commanding the Third Division, whose united lines had held one of the key-points of the Federal left since 9 o'clock in the forenoon against numerous and well-concentrated assaults of the enemy, found that the withdrawal of troops both on the right and the left produced gaps that offered an opening to the enemy. Prentiss had been instructed by General Grant to hold his position at all hazards, and consulting with Wallace they determined to obey the order notwithstanding the now dangerous exposure. But the enemy seized the advantage; they quickly found themselves enveloped and surrounded; only portions of their command succeeded in cutting their way out; Wallace was mortally wounded, and Prentiss and fragments of the two divisions, numbering 2200 men, were taken prisoners.

This wholesale capture left a wide opening in the left of the Federal lines, and probably would have given the victory to the rebels but for another circumstance which somewhat compensated for so abrupt a diminution of the Union forces. The Union lines had now been swept back more than a mile and a half, and the rebel attack was approaching the main

Corinth road, running from Pittsburg Landing along the principal ridge, which here lay nearly at a right angle to the river. Colonel Webster of General Grant's staff, noting the steady retreat of the Union lines and foreseeing that the advancing attack of the enemy would eventually reach this ridge, busied himself to post a line of artillery—from thirty-five to fifty guns—along the crest, gathering whatever was available, among which were several heavy pieces. To man and support this extemporized battery he organized and posted, in conjunction with Hurlbut's division, such fragments of troops as had become useless at the front. To reach the crest of this ridge and this line of hastily planted cannon the enemy was obliged to cross a deep, broad hollow, extending to the river and partly filled with back-water. The topography of the place was such that the gun-boats *Tyler* and *Lexington* were also stationed in the Tennessee, abreast the valley and sheet of back-water, and their guns were thus enabled to assist the line of cannon on the ridge by a cross-fire of shells.

General Grant had passed the previous night at Savannah, where he had become aware of the arrival of the advance brigades of Nelson's division of Buell's army on the same day (April 5). He started by boat to Pittsburg Landing early Sunday morning, having heard the firing but not regarding it as an attack in force. Arrived there he became a witness of the serious nature of the attack, and remained on the battle-field, visiting the various division commanders and giving such orders as the broken and fluctuating course of the conflict suggested. But the defense, begun in uncertainty and haste before his arrival, could not thereafter be reduced to any order or system; it necessarily, all day long, merely followed the changes and the violence of the rebel attack. The blind and intricate battle-field offered little chance for careful planning; the haste and tumult of combat left no time for tactics. On neither side was the guidance of general command of much service; it was the division, brigade, and regimental commanders who fought the battle. About noon of Sunday General Grant began to have misgivings of the result, and dispatched a letter for help to Buell's forces at Savannah, saying, "If you will get upon the field, leaving all your baggage on the east bank of the

* Throughout the history of the War of the Rebellion there is a marked disagreement in the estimate of numbers engaged in battles, as stated by the Unionists on one side and the Confederates on the other. This variance comes from a different manner of reporting those "present for duty" in the two armies, out of which arises a systematic diminution of Confederates and increase of Federals in the statements of Confederate writers. General Force, in his admirable little book, "From Fort Henry to Corinth," analyzes these

methods of computation as applied to the battle of Shiloh, and arrives at the conclusion that the actual number of "combatants engaged in the battle" of Sunday was fully 40,000 Confederates and between 32,000 and 33,000 Unionists.

The reinforcements of Monday numbered, of Buell's army, about 20,000; Lew. Wallace's, 6500; and other regiments, about 1400.

† W. P. Johnston in "Battles and Leaders of the Civil War," Vol. I., p. 504.

river, it will be more to our advantage, and possibly save the day to us." He also sent an order to General Lew. Wallace, at Crump's Landing, to hasten his division to the right of the army.

So far as the Confederates had any distinct plan of battle, it was merely the simple one of forcing the Federals away from the river to gain possession of Pittsburg Landing, cut off their means of retreat by seizing or destroying the transports, and compel Grant to capitulate. But the execution of this leading design was completely frustrated by the difficult nature of the ground and by the gallant resistance made by Prentiss and Wallace, who held their line on the Union left, unshaken and unmoved, from 9 o'clock in the forenoon until 5 o'clock in the evening. The principal advance made by the rebels was not next to the river, where they desired it, but on the Union right next to Owl Creek, where it was of least value. Even after they had captured the whole residue of Prentiss's and Wallace's divisions, and had cleared out that terrible center of the Union fire which they had ineffectually assaulted a dozen times, and which by bitter experience they themselves learned to know and designate as the "Hornets' Nest," and near which their Commander-in-Chief had fallen in death, they were not yet within reach of the coveted banks of Pittsburg Landing. Before them still yawned the broad valley, the back-water, the mire, the steep hills across which screeched the shells from the gunboats and from the long death-threatening line of Webster's reserve artillery, and behind which the bayonets of Hurlbut's division, yet solid in organization and strong in numbers, glinted in the evening sun. From Hurlbut's right the shattered but courageous remnants of the divisions of McClelland and Sherman stretched away in an unbroken line towards Owl Creek. Ground had been lost and ground had been won; the line of fire had moved a mile and a half to the north; the lines of combatants had been shortened from three miles in the morning to one mile in the evening; but now, after the day's conflict, when the sun approached his setting, the relations and the prospects of the bloody fight were but little changed. The Confederates held the field of battle, but the Unionists held their central position, their supplies, and their communications. The front of attack had become as weak as the front of defense. On each side from eight to ten thousand men had been lost, by death, wounds, and capture. From ten to fifteen thousand panic-stricken Union stragglers cowered under the shelter of the high river bank at Pittsburg Landing. From ten to fifteen thousand Confederate stragglers, some

equally panic-stricken, others demoralized by the irresistible temptations of camp-pillage, encumbered the rear of Beauregard's army. The day was nearly gone and the battle was undecided.

A controversy has recently arisen as to the personal impressions and intentions of General Grant at this crisis. His "Memoirs" declare in substance that he was still so confident of victory that he gave orders that evening for a renewal of the fight on the following morning by a general attack. General Buell, on the other hand, makes a strong argument that the evidence is against this assumption.* It is possible, as in so many other cases, that the truth lies midway between the two statements. A famous newspaper correspondent who was on the battle-field made the following record of the affair long before this controversy arose:

The tremendous roar to the left, momentarily nearer and nearer, told of an effort to cut him off from the river and from retreat. Grant sat his horse, quiet, thoughtful, almost stolid. Said one to him, "Does not the prospect begin to look gloomy?" "Not at all," was the quiet reply. "They can't force our lines around these batteries to-night—it is too late. Delay counts everything with us. To-morrow we shall attack them with fresh troops and drive them, of course."

The correspondent adds, in a note: "I was myself a listener to this conversation, and from it I date, in my own case at least, the beginning of any belief in Grant's greatness."†

As this writer was one of Grant's most candid critics, his testimony on this point is all the more valuable.

The turning-point was at length reached. Whatever may have been the much-disputed intentions and hopes of commanders at that critical juncture that were not expressed and recorded, or what might have been the possibilities and consequence of acts that were not attempted, it is worse than useless to discuss upon hypothesis. Each reader for himself must interpret the significance of the three closing incidents of that momentous Sunday, which occurred almost simultaneously.

Some of the rebel division commanders, believing that victory would be insured by one more desperate assault against the Union left to gain possession of Pittsburg Landing, made arrangements and gave orders for that object. It seems uncertain, however, whether the force could have been gathered and the movement made in any event. Only a single brigade made the attempt, and it was driven back in confusion. The officer of another

* Buell in "Battles and Leaders of the Civil War," Vol. I., p. 523, *et seq.*

† Whitelaw Reid, "Ohio in the Civil War."

detachment refused the desperate service. Still others were overtaken in their preparation by orders from General Beauregard to withdraw the whole Confederate army from the fight, and to go into bivouac until the following day. Eager as was that commander for victory, the conclusion had been forced on his mind, that, for that day at least, it was not within the power of his army to complete their undertaking; and accordingly he directed that the fight should cease. He reached this determination not knowing that Buell had arrived, and still hoping that he would not arrive, even on the morrow.

In this hope Beauregard was disappointed. While yet his orders to retire from the combat were being executed, and before the last desperate charge of the rebels towards Webster's reserve artillery was beaten back, the vanguard of Nelson's division, which had marched from Savannah and had been ferried across the river by transports, was mounting the bank at Pittsburg Landing and deploying in line of battle under the enemy's fire. Ammen's fresh brigade first coming to the support of the line of Union guns. A few men out of the brigade fell by the rebel bullets, and then came twilight, and soon after the darkness of night. The tide of victory was effectually turned. Whatever the single army of Grant might or might not have accomplished on the following day against the army of Beauregard is only speculation. Beauregard's attack had been ordered discontinued before the actual presence of Buell's troops on the battle-field. Had the attack been continued, however, that opportune arrival would have rendered its success impossible.

After sunset of Sunday all chances of a rebel victory vanished. The remainder of Nelson's division immediately crossed the river and followed Ammen's brigade to the field. Crittenden's division was next placed in position during the night. Finally McCook's division reached Pittsburg Landing early Monday morning and promptly advanced to the front. General Buell, who had come before the vanguard on Sunday evening, in person directed the placing and preparation of these three superb divisions of his army—a total of about twenty thousand fresh, well-equipped, and well-drilled troops—to renew an offensive conflict along the left of the Federal line. On the Federal right was stationed the fresh division of General Lew. Wallace, numbering 6500, which had arrived from Crump's Landing a little after nightfall, and which took position soon after midnight of Sunday. Along the Federal right center, Grant's reduced divisions which had fought the battle of Sunday were gathered and reorganized, McClelland and

Sherman in front, Hurlbut and the escaped remnants of W. H. L. Wallace's division, with some new detachments, in reserve. Grant and Buell met on Sunday evening and agreed to take the offensive jointly on Monday morning; Buell to command his three divisions on the left, Grant to direct his own forces on the right. No special plan was adopted other than simultaneously to drive the enemy from the field. The plan was carried out in harmony and with entire success. With only temporary checks, brought about by the too great impetuosity of the newly arrived reinforcements, the two wings of the Union army advanced steadily, and by 3 o'clock in the afternoon were in possession of all the ground from which they had been driven on the previous day; while the rebel army was in full retreat upon Corinth—foiled of its victory, dejected in spirit, and in a broken and almost hopeless state of disorganization. A little more genius and daring on the part of the Union commanders would have enabled them by vigorous pursuit to demolish or capture it; but they chose the more prudent alternative, and remained satisfied with only sufficient advance to assure themselves that the enemy had disappeared.

HALLECK'S CORINTH CAMPAIGN.

On Wednesday, April 9, two days after the battle of Shiloh, General Grant gave evidence that he had fully learned the severe lesson of that terrible encounter. Reporting to Halleck his information that the enemy was again concentrating all his forces at Corinth, he added:

I do not like to suggest, but it appears to me that it would be demoralizing upon our troops here to be forced to retire upon the opposite bank of the river, and unsafe to remain on this many weeks without large reinforcements.

If his mind had reached a conviction of this character two or three weeks earlier, the results of the battle of Shiloh would have given better testimony to his military efficiency.

Halleck's opinion probably coincided with that of Grant, and the fortunes of war enabled him immediately to fulfill his promise to come to his relief. The day which saw the conclusion of the fight at Shiloh (April 7, 1862) witnessed the surrender of the rebel works at Island No. 10, on the Mississippi River, and the quick capture of nearly their entire garrison of six or seven thousand men. This finished the task which General Pope had been sent to do and enabled Halleck to transfer him and his army, by water, from the Mississippi River to the Tennessee. Halleck's order was made on April 15, and on the 22d Pope landed at

Hamburg, four miles above the battle-field of Shiloh, with his compact force of twenty thousand men fully organized and equipped, and flushed with a signal victory.

Halleck had arrived before him. Reaching Pittsburg Landing on the 11th of April, he began with industry to cure the disorders produced by the recent battle. Critics who still accuse the Lincoln administration of ignorant meddling with military affairs are invited to remember the language of the Secretary of War to Halleck on this occasion: "I have no instructions to give you. Go ahead, and success attend you."

The arrival of Pope was utilized by Halleck to give his united command an easy and immediate organization into army corps. His special field orders of April 28 named the Army of the Tennessee the First Army Corps, commanded by Grant, and constituting his right wing; the Army of the Ohio the Second Army Corps, commanded by Buell, and constituting the center; and the newly arrived Army of the Mississippi the Third Army Corps, commanded by Pope, and forming the left wing. Two days later (April 30) another order gave command of the right wing to General Thomas, whose division of the Army of the Ohio was added to it; it also organized a reserve corps under General McClelland, and had this provision:

Major-General Grant will retain the general command of the district of West Tennessee, including the Army Corps of the Tennessee, and reports will be made to him as heretofore; but in the present movements he will act as second in command under the major-general commanding the department.

The exact intent of this assignment remains to this day a matter of doubt. Nominally, it advanced Grant in rank and authority; practically, it deprived him of active and important duty. Halleck being on the field in person issued his orders directly to the corps commanders and received reports from them, and for about two months Grant found himself without serious occupation. The position became so irksome that he several times asked to be relieved, but Halleck refused; though he finally allowed him to go for a season into a species of honorable retirement, by removing his headquarters from the camp of the main army.

Coming to the front so soon after the great battle, Halleck seems to have been impressed with the seriousness of that conflict, for all his preparations to assume the offensive were made with the most deliberate caution. It was manifest that the enemy intended to defend Corinth, and necessarily that place became his first objective. With all the efforts that the Confederate Government could make, however, Beauregard succeeded in bringing

together only about fifty thousand effective troops. Halleck's combined armies contained more than double that number; but such was his fear of another disaster, that his advance upon Corinth was not like an invading march, but like the investment of a fortress. An army carrying a hundred thousand bayonets, in the picturesque language of General Sherman, moved upon Corinth "with pick and shovel." Intrenching, bridge-building, road-making, were the order of the day. Former carelessness and temerity were succeeded by a fettering over-caution.

The Administration expected more energetic campaigning from a commander of Halleck's reputed skill and the brilliant results realized since his advent. The country seemed at the culmination of great events. Since the beginning of the year success had smiled almost continuously upon the Union cause. As the crowning inspiration, in the midst of his march there had come the joyful news of Farragut's triumph and the capture of New Orleans. "Troops cannot be detached from here on the eve of a great battle," telegraphed Halleck to Stanton. "We are now at the enemy's throat." To such encouraging assurances the Administration responded with every possible exertion of reinforcement and supply. But days succeeded days, and the President's hope remained deferred. Nearly a month later, when reports came that Halleck was awaiting the arrival of a fourth Union army,—that of Curtis from Arkansas,—and these reports were supplemented by intimations that he would like to be joined by a fifth army from somewhere else, Mr. Lincoln sent him a letter of so kindly an explanation, that, in the actual condition of things, every word was a stinging rebuke:

Several dispatches from Assistant-Secretary Scott and one from Governor Morton, asking reinforcements for you, have been received. I beg you to be assured we do the best we can. I mean to cast no blame when I tell you each of our commanders along our line from Richmond to Corinth supposes himself to be confronted by numbers superior to his own. Under this pressure we thinned the line on the Upper Potomac, until yesterday it was broken at heavy loss to us and General Banks put in great peril, out of which he is not yet extricated and may be actually captured. We need men to repair this breach, and have them not at hand. My dear general, I feel justified to rely very much on you. I believe you and the brave officers and men with you can and will get the victory at Corinth.

In reply Halleck resorted to the usual expedient of reading the Secretary of War a military lecture. May 26 he wrote:

Permit me to remark that we are operating upon too many points. Richmond and Corinth are now the great strategical points of war, and our success at these points should be insured at all hazards.

His herculean effort expended itself without corresponding result, when, a week later, he marched into the empty intrenchments of Corinth, only to find that the fifty thousand men composing Beauregard's army — the vital strength of rebellion in the West — were retreating at leisure to Baldwin and Okalona, railroad towns some fifty miles to the south. It had required but two days for the rebel army to go from Corinth to the Shiloh battle-field. Halleck consumed thirty-seven days to pass over the same distance and the same ground, with an army twice as strong as that of his adversary. Pope had reached him April 22, and it was the 29th of May when the Union army was within assaulting distance of the rebel intrenchments. The campaign had advanced with scientific precision, and attained one object for which it was conducted: it gained the fortifications of Corinth. In the end, however, it proved to be but the shell of the expected victory. Beauregard had not only skillfully disputed the advance and deceived his antagonist, but at the critical moment had successfully withdrawn the rebel forces to wage more equal conflict on other fields. The enemy evacuated Corinth on the night of the 29th, and beyond the usual demoralization which attends such a retrograde movement suffered little, for Halleck ordered only pursuit enough to drive him to a convenient distance. The achievement was the triumph of a strategist, not the success of a general. Instead of seizing his opportunity to win a great battle or to capture an army by siege, he had simply manœuvred the enemy out of position.

In reporting his success to Washington, Halleck of course magnified its value to the utmost,* and for the moment the Administration, not having that full information which afterward so seriously diminished the estimate, accepted the report in good faith as a grand Union triumph. It was indeed a considerable measure of success. Besides its valuable moral effect in strengthening the patriotism and the confidence of the North, and the secondary military advantage that the combined Western armies gained in the two months' strict camp discipline and active practical in-

struction in the art of field fortification, there was the positive possession of an important railroad center, and the apparent security of western and central Tennessee from rebel occupation.

In addition to these it had one yet more immediate and valuable military result. The remaining rebel strongholds on the upper Mississippi were now so completely turned that they were no longer tenable. Forts Pillow and Randolph were hastily evacuated by the enemy, and the Union flotilla took possession of their deserted works on June 5. Halleck had been looking somewhat anxiously for help on the river, and had complained of the unwillingness of the gun-boats to run past the Fort Pillow batteries and destroy the river fleet of the rebels. Flag-Officer Davis had considered the risk too great and had remained above Fort Pillow, occupying his time in harassing the works by a continuous bombardment. Now that the way was opened he immediately advanced in force, and at night of June 5 came to anchor two miles above the city of Memphis. His flotilla had lately received a notable reinforcement. One of the many energetic impulses which Stanton gave to military operations in the first few months after he became Secretary of War was his employment of an engineer of genius and daring, Charles Ellet, Jr., to extemporize a fleet of steam rams for service on the Western rivers.

The single blow by which the iron prow of the *Merrimac* sunk the frigate *Congress* in Hampton Roads, during the famous sea-fight between the *Merrimac* and the *Monitor*, had demonstrated the effectiveness of this novelty in marine warfare. Ellet's proposal to the Secretary of the Navy, to try it on the Western rivers, was not favorably entertained; probably because the Navy Department already had its officers and its appropriations engaged in other more methodical and permanent naval constructions. But the eager and impatient Secretary of War listened to Ellet's plans with interest, and commissioned him to collect such suitable river craft as he could find on the Ohio, and to convert them post-haste into steam rams, "the honorable Secretary," reports Ellet, "expressing the hope that not

* Pope, condensing into one dispatches from Rosecrans, Hamilton, and Granger, telegraphed to Halleck: "The two divisions in the advance under Rosecrans are slowly and cautiously advancing on Baldwin this morning, with the cavalry on both flanks. Hamilton with two divisions is at Rienzi and between there and Boonville, ready to move forward should they be needed. One brigade from the reserve occupies Danville. Rosecrans reports this morning that the enemy has retreated from Baldwin, but he is advancing cautiously. The woods, for miles, are full of stragglers from the enemy, who are coming in in squads. Not less than ten thousand men

are thus scattered about, who will come in within a day or two." General Halleck dispatched to the War Department: "General Pope, with 40,000 men, is 30 miles south of Corinth, pushing the enemy hard. He already reports 10,000 prisoners and deserters from the enemy, and 15,000 stand of arms captured." This dispatch of General Halleck's made a great sensation. The expectation that the stragglers would come into the national camp was disappointed; the prisoners taken were few, and Pope was censured for making a statement of fact which he neither made nor authorized. [Force, "From Fort Henry to Corinth."]]

more than twenty days would be consumed in getting them ready for service." Ellet received his orders March 27.* On May 26 he joined the flotilla of Davis with a fleet of six vessels, formerly swift and strong river tugs and steamers, but now strengthened and converted for their new and peculiar service, and these accompanied the gun-boats in the advance against Memphis. On the morning of June 6 the rebel flotilla of eight gun-boats was discovered in front of the city preparing for fight, and there occurred another of the many dramatic naval combats of the war.

The eight rebel gun-boats ranged themselves in two lines abreast the city. The hills of Memphis were covered with thousands of spectators. With the dawn five of the Union gun-boats began backing down the Mississippi, holding their heads against the strong current to insure easier control and management of the vessel. The steam rams were yet tied up to the river bank. Soon the rebel flotilla opened fire on the Union gun-boats, to which the latter replied with spirit. Four of Ellet's rams, hearing the guns, cast loose to take part in the conflict. One of them disabled her rudder, and another, mistaking her orders, remained out of fighting distance. But the *Queen of the West* and the *Monarch*, passing swiftly between the gun-boats, dashed into the rebel line. The gun-boats, now turning their heads down the stream, hastily followed. There was a short and quick mêlée of these uncouth-looking river monsters, ram crashing into ram and gun-boat firing into gun-boat in a confusion of attack and destruction. In twenty minutes four rebel vessels and one Union ram were sunk or disabled. At this the other four rebel vessels turned and fled down-stream, and in a running pursuit of an hour, extending some ten miles, three additional vessels of the enemy were captured or destroyed. The Confederate fleet was almost annihilated; only one of their gun-boats escaped. The two disabled Union ships were soon raised and repaired, but the ram fleet had suffered an irreparable loss. Its commander, Ellet, was wounded by a pistol-shot, from the effect of which he died two weeks later. The combat was witnessed by Jeff. Thompson, commanding the city with a small detachment of rebel troops. In his report of the affair he mentions that "we were hurried in our retirement from Memphis," and that afternoon the Union flag floated over the city.

The naval victory of Memphis supplemented and completed the great Tennessee campaigns begun by Grant's reconnaissance of January 9. A division of Buell's army under General Mitchell had in the meanwhile occupied and held the line of the Tennessee River between Tusculum and Stevenson; and thus the frontier of rebellion had been pushed down from middle Kentucky below the southern boundary of the State of Tennessee.

But the invading movement following the line of the Tennessee River had expended its advantage; the initial point of a new campaign had been reached. We are left in doubt under what conviction Halleck formed his next plans, for he determined to dissolve and scatter the magnificent army of more than one hundred thousand men under his hand and eye; apparently in violation of the very military theory he had formulated two weeks before, when he said, "We are operating on too many points." In a dispatch to the Secretary of War on the 9th of June he announced his purpose to do three distinct things: First, to hold the Memphis and Charleston railroad; secondly, to send relief to Curtis in Arkansas; thirdly, to send troops to east Tennessee. To these three he added a fourth purpose in a dispatch of June 12:

If the combined fleet of Farragut and Davis fail to take Vicksburg, I will send an expedition for that purpose as soon as I can reinforce General Curtis.

Up to this point the country's estimate of General Halleck's military ability had steadily risen, but several serious errors of judgment now arrested his success. The greatest of these errors, perhaps, was the minor importance he seems to have attached to a continuation of the operations on the Mississippi River.

We have mentioned the victory of Farragut, and we need now to follow the upward course of his fleet. After receiving the surrender of New Orleans in the last days of April, he promptly pushed on an advance section of his ships up the Mississippi, which successively, and without serious opposition, received the surrender of all the important cities below Vicksburg, where Farragut himself arrived on the 20th of May. Vicksburg proved to be the most defensible position on the Mississippi, by reason of the high bluffs at and about the city. The Confederates had placed such faith in their defenses of the upper river, at Columbus, Island No. 10, and Fort Pillow, that no

* In response to that order I selected three of the strongest and swiftest stern-wheel coal tow-boats at Pittsburg, of which the average dimensions are about 170 feet length, 30 feet beam, and over 5 feet hold. At Cincinnati I selected two side-wheel boats, of which the largest is 180 feet long, 37½ feet beam in the wid-

est part, and 8 feet hold. At New Albany I secured a boat of about the same length but rather less beam, and subsequently I selected another at Cincinnati, of about the same class as the last, and sent her to Madison to be fitted out. [Ellet to McGunnigle, April 27, 1862. War Records.]

early steps were taken to fortify Vicksburg; but when Farragut passed and captured the lower forts and the upper defenses fell, the rebels made what haste they could to create a formidable barrier to navigation at Vicksburg. Beauregard sent plans for fortifications while he was yet disputing Halleck's advance from Shiloh to Corinth; and Lovell at New Orleans, retreating before Farragut's invasion, shipped the heavy guns he could no longer keep, and sent five regiments of Confederate troops, which he could no longer use, to erect the works. These reached their destination on May 12, and continuing the labors and preparations already begun, he had six batteries ready for service on Farragut's arrival. Remembering these dates and numbers, we can realize the unfortunate results of Halleck's dilatory Corinth campaign. He had then been in command, for a whole month, of forces double those of his antagonist. If, instead of digging his way from Shiloh to Corinth "with pick and shovel," he had forced such a prompt march and battle as his overwhelming numbers gave him power to do, the inevitable defeat or retreat of his enemy would have enabled him to meet the advance of Farragut with an army detachment sufficient to effect the reduction of Vicksburg with only slight resistance and delay. Such a movement ought to have followed by all the rules of military and political logic. The opening of the Mississippi outranked every other Western military enterprise in importance and urgency. It would effectually sever four great States from the rebel Confederacy; it would silence doubt at home and extinguish smoldering intervention abroad; it would starve the rebel armies and feed the cotton operatives of Europe. There would have been ample time; for he was advised as early as the 27th of April that New Orleans had been captured and that Farragut had "orders to push up to Memphis immediately," and he ought to have prepared to meet him.

No such coöperation, however, greeted Farragut. Reaching Vicksburg, his demand for the surrender of the place was refused. The batteries were at such a height that his guns could have no effect against them. Only two regiments of land forces accompanied the fleet. There was nothing to be done but to return to New Orleans, which he reached about the 1st of June. Here he met orders from Washington communicating the great desire of the Administration to have the river opened, and directing further efforts on his part to that end. Farragut took immediate measures to comply with this requirement. His task had already become more difficult. The enemy quickly comprehended the advantage which

the few high bluffs of the Mississippi afforded them, if not to obstruct, at least to harass and damage the operations of a fleet unsupported by land forces. The places which had been surrendered were, on the retirement of the ships, again occupied, and batteries were soon raised, which, though unable to cope with larger vessels, became troublesome and dangerous to transports, and were intermittently used or abandoned as the advantage or necessity of the enemy dictated.

Farragut again reached Vicksburg about June 25, accompanied this time by Porter with sixteen of his mortar-boats, and by General Williams at the head of three thousand Union troops. The mortar-sloops were placed in position and bombarded the rebel works on the 27th. On the morning of June 28, before daylight, Farragut's ships, with the aid of the continued bombardment, made an attack on the Vicksburg batteries, and most of them succeeded in passing up the river with comparatively small loss. Here he found Ellet—brother of him who was wounded at Memphis—with some vessels of the ram fleet, who carried the news to the gun-boat flotilla under Davis yet at Memphis. This flotilla now also descended the river and joined Farragut on the 1st of July.

We have seen, by the dispatch heretofore quoted, that Halleck expected the combined naval and gun-boat forces to reduce the Vicksburg defenses, but also that, in the event of their failure, he would send an army to help them. The lapse of two weeks served to modify this intention. The Secretary of War, who had probably received news of Farragut's first failure to pass the Vicksburg batteries, telegraphed him (on June 23) to examine the project of a canal to cut off Vicksburg, suggested by General Butler and others. Halleck replied (on June 28), "It is impossible to send forces to Vicksburg at present, but I will give the matter very full attention as soon as circumstances will permit." That same day Farragut passed above the batteries, and of this result Halleck was informed by Grant, who was at Memphis. Grant's dispatch added an erroneous item of news concerning the number of troops with Farragut, but more trustworthy information soon reached Halleck in the form of a direct application from Farragut for help. To this appeal Halleck again felt himself obliged to reply in the negative, July 3, 1862:

The scattered and weakened condition of my forces renders it impossible for me, at the present, to detach any troops to coöperate with you on Vicksburg. Probably I shall be able to do so as soon as I can get my troops more concentrated. This may delay the clearing of the river, but its accomplishment will be certain in a few weeks.

The hopeful promise with which the telegram closed dwindled away during the eleven days that followed. On the 14th of July Stanton asked him the direct question:

The Secretary of the Navy desires to know whether you have, or intend to have, any land force to coöperate in the operations at Vicksburg. Please inform me immediately, inasmuch as orders he intends to give will depend on your answer.

The answer this time was short and conclusive. "I cannot at present give Commodore Farragut any aid against Vicksburg."

A coöperative land force of from 12,000 to 15,000 men, Farragut estimated in his report of June 28, would have been sufficient to take the works. If we compare the great end to be attained with the smallness of the detachment thought necessary, there remains no reasonable explanation why Halleck should not have promptly sent it. But the chance had been lost. The waters of the Mississippi were falling so rapidly that Farragut dared not tarry in the river; and in accordance with orders received from the Department on July 20, he again ran past the Vicksburg batteries and returned to New Orleans.

If Halleck's refusal to help Farragut take Vicksburg seems inexplicable, it is yet more difficult to understand the apparently sudden cessation of all his former military activity, and his proposal, just at the point when his army had gathered its greatest strength and efficiency, abruptly to terminate his main campaign, and, in effect, go into summer quarters. He no longer talked of splitting secession in twain in one month, or of being at the enemy's throat. He no longer pointed out the waste of precious time, and uttered no further complaint about his inability to control Buell's army. His desires had been gratified. He commanded half of the military area within the Union; he had three armies under his own eye; the enemy was in flight before him; he could throw double numbers of men at any given point. At least two campaigns of overshadowing importance invited his resistless march. But in the midst of his success, in the plenitude of his power, with fortune thrusting opportunity upon him, he came to a sudden halt, folded his contented arms, and imitated the conduct that he wrongfully imputed to Grant after Donelson—"Satisfied with his victory, he sits down and enjoys it without regard to the future." In a long letter to the Secretary of War, dated June 25, after reviewing the sanitary condition of the army and

pronouncing it very good, he asks, apparently as the main question, "Can we carry on any summer campaign without having a large portion of our men on the sick-list?" This idea seems to dominate his thought and to decide his action. Buell had been ordered eastward on a leisurely march towards Chattanooga. Halleck proposed to plant the armies of Grant and of Pope on the healthy uplands of northern Mississippi and Alabama as mere corps of observation. Having personally wrested Corinth from the enemy, he exaggerated its strategical value. As a terminal point in the southward campaign, along the line of the Tennessee River, its chief use was to aid in opening the Mississippi River by turning the Confederate fortifications from Columbus to Memphis. Those strongholds once in Federal possession, Corinth inevitably fell into a secondary rôle, especially since the summer droughts rendered the Tennessee River useless as a military highway.

Carrying out this policy of Halleck, a large portion of the Western armies of the Union wasted time and strength guarding a great area of rebel territory unimportant for military uses, and which could have been better protected by an active forward movement. The security and the supply of Corinth appears to have been the central purpose. Buell was delayed in his march thoroughly to repair the railroad from Corinth eastward towards Chattanooga. Other detachments of the army were employed to repair the railroads westward from Corinth to Memphis, and northward from Corinth to Columbus. For several months all the energies of the combined armies were diverted from their more legitimate duty of offensive war to tedious labor on these local railroads;* much of the repairs being destroyed, almost as rapidly as performed, by daring guerrilla hostilities, engendered and screened amidst the surrounding sentiment of disloyalty.

It is impossible to guess what Halleck's personal supervision in these tasks might have produced, for at this juncture came a culmination of events that transferred him to another field of duty; but the legacy of policy, plans, and orders that he left behind contributed to render the whole Western campaign sterile throughout the second half of 1862.

The infatuation of Halleck in thus tying up the Western forces in mere defensive inaction comes out in still stronger light in the incident that follows, but it especially serves to show once more how, in the West as well as in the

* I inclose herewith a copy of a report of Brigadier-General McPherson, superintendent of railroads, from which it will be seen that we have opened 367 miles of road in less than one month, besides repairing a number of locomotives and cars which were captured

from the enemy greatly injured. Indeed, the wood-work of most of the cars has been entirely rebuilt, and all this work has been done by details from the army. [Halleck to Stanton, July 7, 1862. War Records.]

East, President Lincoln treated his military commanders, not with ignorant interference, as has been so often alleged, but with the most fatherly indulgence. Future chapters will describe the complete failure in the East of the campaign undertaken by McClellan against Richmond, and which, on the 30th of June, brought to Halleck an order from the Secretary of War, dated the 28th, immediately to detach and send 25,000 men to assist that imperiled enterprise. The necessity was declared "imperative." "But in detaching your force," explained the order, "the President directs that it be done in such a way as to enable you to hold your ground and not interfere with the movement against Chattanooga and east Tennessee." Halleck took instant measures to obey the order, but said in reply that it would jeopardize the ground gained in Tennessee and involve the necessity of abandoning Buell's east Tennessee expedition. This result the President had in advance declared inadmissible. He now telegraphed emphatically on June 30:

Would be very glad of 25,000 infantry — no artillery or cavalry; but please do not send a man if it endangers any place you deem important to hold, or if it forces you to give up or weaken or delay the expedition against Chattanooga. To take and hold the railroad at or east of Cleveland, in east Tennessee, I think fully as important as the taking and holding of Richmond.*

This request, but accompanied by the same caution and condition, was repeated by the President on July 2; and again, under the prompting of extreme need, Lincoln on July 4 sent a diminished request, still, however, insisting that no risk be incurred in the West:

You do not know how much you would oblige us if, without abandoning any of your positions or plans, you could promptly send us even ten thousand infantry. Can you not? Some part of the Corinth army is certainly fighting McClellan in front of Richmond. Prisoners are in our hands from the late Corinth army.

In Halleck's response on the following day it is important to notice the difference in the opinions entertained by the two men upon this point. Lincoln wished to gain east Tennessee, Halleck desired to hold west Tennessee. The distinction is essential, for we shall see that while Halleck's policy prevailed, it tended largely, if not principally, to thwart the realization of Lincoln's earnest wish. Halleck telegraphed:

For the last week there has been great uneasiness among Union men in Tennessee on account of the secret organizations of insurgents to coöperate in any attack of the enemy on our lines. Every commanding officer from Nashville to Memphis has asked for reinforcements. Under these circumstances I submitted the question of sending troops to Richmond to the principal officers of my command. They are unanimous in opinion that

* War Records.

if this army is seriously diminished the Chattanooga expedition must be revoked or the hope of holding south-west Tennessee abandoned. I must earnestly protest against surrendering what has cost so much blood and treasure, and which in a military point of view is worth more than Richmond.

He had already, in a previous telegram (July 1), acknowledged and exercised the discretion which Lincoln gave him, replying, "Your telegram, just received, saves western Tennessee."

It was found by the Washington authorities that the early reports of McClellan's reverses had been unduly exaggerated, and that by straining resources in the East, the Western armies might be left undiminished. But with this conviction President Lincoln also reached the decision that the failure of the Richmond campaign must be remedied by radical measures. To devise new plans, to elaborate and initiate new movements, he needed the help of the highest attainable professional skill. None seemed at the moment so available as that of Halleck. Under his administration order had come out of chaos in Missouri, and under his guiding control, however feeble in the particular cases that we have pointed out, the Western armies had won the victories of Fort Henry, Fort Donelson, Pea Ridge, Shiloh, Island No. 10, and Corinth. It was a record of steady success, which justified the belief that a general had been found who might be intrusted with the direction of the war in its larger combinations. The weakness of his present plans had not yet been developed. Accordingly on the 11th of July this order was made by the President:

That Major-General Henry W. Halleck be assigned to command the whole land forces of the United States as General-in-Chief, and that he repair to this capital so soon as he can with safety to the positions and operations within the department under his charge.

It seemed at the moment the best that could be done. In his short Corinth campaign Halleck had substantially demonstrated his unfitness for the leadership of an army in the field. He had made a grievous mistake in coming away from his department headquarters at St. Louis. He was a thinker and not a worker; his proper place was in the military study and not in the camp. No other soldier in active service equaled him in the technical and theoretical acquirements of his profession. The act of the President in bringing him to Washington restored him to his more natural duty.

In following the future career of Halleck, one of the incidents attending this transfer needs to be borne in mind. The first intimation of the change came in the President's dispatch of the 2d of July which asked: "Please tell me could you not make me a flying visit

for consultation without endangering the service in your department?" A few days later one of the President's friends went from Washington to Corinth bearing a letter of introduction to Halleck, explaining among other things:

I know the object of his visit to you. He has my cheerful consent to go, but not my direction. He wishes to get you and part of your force, one or both, to come here. You already know I should be exceedingly glad of this if in your judgment it could be done without endangering positions and operations in the Southwest.

To this Halleck replied on July 10:

Governor Sprague is here. If I were to go to Washington I could advise but one thing—to place all the forces in North Carolina, Virginia, and Washington under one head and hold that head responsible for the result.

It is doubtful if Halleck measured fully the import of his language; or whether he realized the danger and burden of the responsibility which, if he did not invite, he at least thus voluntarily assumed. Nominally he became General-in-Chief, but in actual practice his genius fell short of the high requirements of that great station. While he rendered memorable service to the Union, his judgment and courage sometimes quailed before the momentous requirements of his office, and thrust back upon the President the critical acts which overawed him. In reality, therefore, he was from the first only what he afterward became by technical orders—the President's chief-of-staff.

Before Halleck's transfer to Washington he had ordered Buell to move into east Tennessee, but that commander never seemed to appreciate the great military and political importance of such a movement. He considered the defense of west Tennessee a more essential object; and while his mind was engaged in that direction, Bragg planned and carried into effect a campaign into Kentucky that threatened at one time the most disastrous consequences to the Union cause in that region. He moved northward early in September, 1862, Kirby Smith preceding him with a strong detachment by way of Cumberland Gap, which marched without successful opposition almost to the Ohio River. Buell, believing that Bragg's real object was Nashville, made such dispositions that Bragg got a long start before him in the race to Louisville. He would, in fact, have had that city at his mercy if he had not left the direct road and turned to the right to join Kirby Smith at Frankfort to assist in the melancholy farce of inaugurating a Confederate governor for

Kentucky. Buell thus reached Louisville and immediately marched south in pursuit of Bragg. He overtook his army at Perryville and fought, on the 8th of October, a severe but indecisive battle; Buell kept the field and Bragg retired in the night, and hurried out of Kentucky at a pace that soon distanced his antagonist. The President renewed his earnest solicitations to Buell to occupy east Tennessee; Buell thought this impracticable, and was relieved of command on the 24th of October, and General Rosecrans was appointed to succeed him.

Rosecrans paid as little attention as Buell had done to the orders of the President for the occupation of east Tennessee. He established his headquarters at Nashville, completed and strengthened his communications, and in the latter part of December moved upon General Bragg, who had gone into winter quarters at Murfreesboro'. The two armies came within sight of each other on the night of the 30th of December, 1862, and the next morning at daybreak each general moved to the fight, in pursuance of plans that were the exact counterpart of each other—Rosecrans having ordered his left wing to strike Bragg's right, double it up and take the position at Murfreesboro' in reverse, while Bragg proposed to crush the right wing of Rosecrans, and swinging the Confederate army around pivoting on its right to cut the Union force off from Nashville. Bragg struck the first blow with so much vigor that Rosecrans was obliged to give up his movement on the Confederate right and devote all his energies to the defense of his own position; and in spite of his utmost efforts, and the distinguished bravery with which he was supported by Thomas, Sheridan, and others, he lost ground all day, and at night the lines of the two armies were almost perpendicular to those that they had occupied in the morning. But Bragg had lost so severely in this day's fighting that he was unable to pursue his advantage on the 1st of January, 1863; and on the 2d Rosecrans resumed the offensive on his left with such success that Bragg found himself forced to abandon the field in the night. The losses on both sides were appalling, and the result of the fight was so damaging to Bragg that he was unable to resume active operations during the winter or spring, and was, in fact, so weakened, that when, in the summer of 1863, Rosecrans at last marched against him, he gave up his positions one after another, until the Union army occupied, in September, without striking a blow, the coveted and important mountain fortress of Chattanooga.

THE INDUSTRIAL IDEA IN EDUCATION.

IHAT our public-school system is not so fully utilitarian in its results as it should be is undoubtedly a growing conviction in the minds of many earnest and progressive educators throughout the country. It appears to be equally true that public opinion is quite generally tending in the same direction, especially among the large class of business men and mechanics whose personal experience has convinced them of the inadequacy of the preparation of the schools to enable their graduates to undertake the business of life at a proper advantage. What the progressive educators want to ingraft upon the public-school system of the country, and the thing which public opinion seems to favor the most, is what may be called the industrial idea. What this is, or rather what results are expected from its general adoption, is thus broadly defined by Dr. C. M. Woodward, of the St. Louis manual-training school :

We want an education that shall develop the whole man. All his intellectual, moral, and physical powers should be drawn out, and trained and fitted for doing good service in the battle of life. We want wise heads and skillful hands. There has been a growing demand, not only for men of knowledge, but for men of skill, in every department of human activity. Have our schools and colleges and universities been equal to the demand? Are we satisfied with what they have produced?

He then makes a statement which is quite significant because it is truthful. It is this:

There is a wide conviction of the inutility of schooling for the great mass of children beyond the primary grades, and this conviction is not limited to any class of intelligence.

The reason for this appears to be obvious— that what is acquired beyond these grades does not compensate the average boy for the time expended, and that for prime utility there is little gained by what is taught in the secondary schools. But this conviction should not prevail if our common-school system is to bear its proper fruits, and the industrial idea seems to be the saving measure which has opportunely presented itself to lift the system up to a proper elevation in the respect and confidence of the people. As, therefore, public opinion favors the ingrafting of this idea upon the school system, the question occurs: How is it to be done? This is not so clear, but a way will doubtless be found in good time. In

the mean time let us inquire what has been done and what can be done in the desired direction.

The methods of industrial training which seem to have had some development in public educational work comprise the manual exercises of the kindergarten, the special schools for boys above the age of thirteen years, and the special instruction in sewing which has been connected with the public schools in various ways. It being agreed that some manual work is desirable for primary and grammar grades, the results of this thought have manifested themselves by various spasmodic efforts, which, however, lacked a proper educational connection with the common-school system. "Industrial exhibits," the result of children having been asked to make objects at home, have begun to attract attention, though such work was not the result of systematized study originating in the school-room. Excellent results, it may likewise be said, have been obtained in private or semi-private schools having workshops and special instructors. But workshops and special instructors are things which cannot be generally provided in connection with our public-school system. It is suggested, however, that the best means of creating general interest in industrial methods of education among teachers, school committees, and the public would be by a plan which does not require these accessories.

Interest in the manufactured products of manual-training schools and the incidental courses of instruction in the use of tools seems to have taken attention away from industrial drawing as an indispensable factor to their success; but its great importance in developing the skill of the hand and the eye in obtaining and expressing knowledge should not be lost sight of. In every manual school the thoughts to be expressed in wood, metal, etc. are first expressed by drawing. If, therefore, manual exercises are to be introduced into schools, the first thing as a preparation for them is to introduce industrial drawing. This should be so taught that pupils may be led to express their thought not only by drawing but by making it—that is, by constructing the object of the thought. The extent to which this method may be carried cannot be determined at this time, when our experience with it is still in the first stages. That it is possible to do something, however, has already been fully demonstrated by the excellent results obtained

by the pioneers in this movement in such cities as St. Louis, Chicago, St. Paul, Columbus, Worcester, and Quincy.

This leads directly to a plain statement of the object of this paper, which is to show how manual exercises may be made an outgrowth of industrial drawing, without workshops or special instructors; and it is hoped that what is here presented will be so well understood, and its merits be deemed so apparent, that it will be accorded the same just and discriminative attention and consideration that every honest effort after better methods usually commands.

The plan of work to be here described originated at the Massachusetts Normal Art School, and is used as the basis of work under direction of the Massachusetts Board of Education. The results stated were obtained by an application of the plan to the schools of Quincy, Massachusetts. Briefly, then, the plan is based on the idea that drawing is an outgrowth of the study of *form*: First, that attention is given to obtaining knowledge of form through observation, using hands and eyes in the process; secondly, that expression of these ideas is made through construction (*i. e.*, making objects), drawing, and language; thirdly, that the acquired knowledge is arranged in new forms by invention or design. The method is objective, everything being studied from the forms themselves and not from their pictured representation, which is the result of the observation of others. The theory is, that observation directs the attention of teachers and pupils to the necessity of obtaining clear conceptions of forms; having gained which, the hands, eyes, and mind are again exercised by expression or design.

In the lowest primary schools the pupils are first taught to know spheres, cubes, etc., as representative general forms. They express what they have learned by constructing these forms of clay, and afterwards objects based on them are made of the same or other material. That this work is a delight to children, those who have vivid memories of the mud pies, etc. of their early youth can readily understand. The skill shown in expressing thought through little fingers is often remarkable, teachers declaring that they could not do as well themselves. The discovery that the forms first presented have certain common qualities, such as variously shaped surfaces, lines, and points, leads the children naturally to make use of drawing as a means of expression. But the making of objects does not cease, however; for the children now take pleasure in cutting out of paper or wood the shapes of triangles, spheres, etc. which they have previously drawn. Describing in lan-

guage what is presented is also practiced. The children have thus become imbued with the thought by its threefold expression. Work is not confined to the geometric form alone, but is extended to the various exercises based on it. The drawings may express either the facts of form, as in working-drawings, or the appearance of these facts by freehand perspective. The plan regards every line that expresses a fact of form as being a working-drawing. The drawing, therefore, by which a child represents the true length of an edge, or of a surface bounded by edges, is regarded as a working-drawing. Thus the teacher leads the class to represent the side or the top view of a simple object, as a box or a sled, the children as readily drawing from the object as from a picture of it. The result is a working-drawing. As the pupils advance, mechanical drawings are made from the preliminary freehand views, accuracy being insured by the introduction of compasses and geometric problems. Freehand perspective as a means of pictorial expression is practiced in all the grammar grades.

Exercises have been given in various practical ways; as, for instance, a wooden match-box is presented for study. First, there is placed rapidly on the blackboard freehand drawings of the front and the side. All dimensions are added to the illustration, which is then an exact counterpart of the preliminary sketch made by the draughtsman. Questions are asked as to the size of each piece of wood, and illustration of each separately is made on the board. It is seen that the example for the occasion is composed of, let us assume, five oblong pieces of wood. The teacher asks the boys if they could not cut out of wood oblongs corresponding to the drawings. It seems simple enough, and many eagerly volunteer their willingness to construct the object. But that cannot be done directly. There must be accurate drawings made to work from. Consequently these are made mechanically from the sketches on the board, either full size or to a scale; having produced which, those who have volunteered to make the object are allowed for that purpose to take the drawings home, it not being practicable, as a rule, to have such work done in school. The teacher having been able to give but few hints regarding the construction of the object, the child, naturally enthusiastic, seeks the aid of the folks at home, who thus unconsciously become teachers of manual training. It is true that home surroundings vary, but, notwithstanding, it has been found that pupils receive many practical hints in this way. Having completed the object, it is returned, together with the drawing, to the

teacher, for careful examination, comparison, and criticism.

Now no thoughtful person can fail to see that the pupils who have thus gone through such an exercise have been benefited in many ways, for throughout the whole experience the mind has been exercised in studying the thought to be expressed, first by drawing, and secondly by construction. Drawing and otherwise expressing these ideas have exercised both the hand

tates a certain orderly procedure that cannot fail to result in an orderly habit of thought, good judgment, the power of concentration, economical use of time, etc.—qualities which cannot be too highly valued as contributing the most important elements of a useful life.

Says Dr. Woodward:

The habit of working on an exact plan of analyzing an apparently complicated operation into a series of simple steps enables one to solve many a new prob-

AN EXAMINATION IN DESIGN DRAWING.

and the eye. All the energies of the mind, and the skill of the hand and eyes, being thus enlisted in behalf of a true expression of thought, the moral effect is assured. Indeed, the tendency of this work must be obvious. Especially is it suggestive of an easy method of introducing manual exercises, making them an outgrowth of industrial drawing, which may be termed the mainstay of manual training. Children, who are ever desirous of making or constructing something, have their efforts directed by this means into an educational channel. The three means of expression, construction, drawing, and language, each offer an excellent mental training, aside from increased skillfulness in the use of hands and eyes. Yet these means will not give accurate results unless they are the product of systematic thought. To draw, make, or describe a thing correctly necessi-

tem, even with new material and under entirely novel circumstances.

Of the moral effect he says:

Its influence is wholesome. It stimulates the love for intellectual honesty. It deals with the substance as well as the shadow. It gives opportunity for primitive judgments. It shows in the concrete, in the most unmistakable form, the vast difference between right and wrong. It substitutes personal experience and the use of simple, forcible language for the experience of others expressed in high-sounding phrase. It associates the deed with the thought, the real with the ideal, and lays the foundation for honesty in thought and in act.

How suggestive, then, is such an exercise! Suppose that but one came in the course of a year, would it not do more to show the practical usefulness of drawing than any number of exercises limited to flat copying? But it is not proposed thus to confine such exercises.

WORKING AT HOME FROM DESIGNS DRAWN AT SCHOOL.

From time to time the drawing regularly done in the school may be given so as to admit of drawing from objects and the construction of objects from drawings.

The exercise which has been described will no doubt be judged to be purely utilitarian, but attention is called to another important outgrowth which may result from it. In discussing the beauty of the match-box it was agreed that it might be made more pleasant to the eye if curves were substituted for the straight lines of the back. It was also agreed that the front of the box might be decorated by the addition of a simple design to be cut out or painted. Pupils were allowed to make suggestions of improvements in their

drawings, thus exercising their taste and producing results which may be noted in the illustrations.

This particular exercise has been described somewhat in detail in the hope that teachers may be induced to try similar ones. At Quincy a great variety of objects have been produced, and many of the pupils have become so much interested that they have attempted work that was much more ambitious than that given out by the teachers. Indeed, an interest having once been excited, both teachers and pupils have worked with the finest enthusiasm. Let it be noted, also, that the objects produced were all of a useful character, being either of full size or in miniature.

Consideration was had, of course, for the materials and the appliances for working them into shape which the pupils would naturally find at home, thin wood, cloth, etc. being the materials most likely to be found there. The hammer, saw, etc. of the family tool-box were the means of execution. Can any one doubt

exercises have been given in which a class had for a definite purpose the design and decoration of pen-wipers, pin-cushions, book-marks, tidies, etc.; and it was interesting to observe that many girls had made their first experiment of needlework in this connection. In Quincy it is hoped to make drawing a

ARTICLES MADE AT HOME BY SCHOOL CHILDREN.

that these little workmen had a genuine love for their work?

The third main part of the general outline has reference to new combinations of known forms, the exercises in connection with it being a natural outgrowth of observation and expression. Every exercise is designed to illustrate some principle, such as symmetry, repetition, etc. Remembering that professional designers require something to furnish suggestions, the children make use of sticks, colored papers, plant-forms, and historic ornaments. By means of these they exercise the inventive faculty, imagination is trained, and the power to conceive with accuracy developed. The first exercises are termed elementary. In the higher grades the designs refer to both the construction and the decoration of the objects, and may be presented by any of the means of expression. This department of the subject is suggestive of many exercises in which girls may apply their designs to examples of needlework, by which their taste may be refined and home beautified. Having this object in mind,

necessity in connection with the design and cutting of female garments. But needlework alone has not occupied the attention of the girls, for in one school an exercise in woodwork was better done by the girls than by the boys. In order to provide pupils with work best adapted to their ability, it has been found necessary to have two exercises in progress at the same time. Thus boys made pencil-sharpeners, while the girls made pen-wipers. The boys were gallant enough to make extra sharpeners for some of the girls, while the latter, not to be outdone, showed their appreciation and thoughtfulness by making extra pen-wipers for the boys; the objects in every case, it may be added, being made from drawings.

The work which has been briefly outlined above is regarded simply as a beginning. It is hoped that there will be a more general study of this manner of connecting the manual work of the kindergarten with that of the special school. It cannot be doubted that industrial drawing will be the foundation of any attempt to combine manual training with the

existing studies of the primary and grammar schools. Eyes and hands are means by which ideas are brought to the mind, and also the means by which they are afterwards given out in tangible form. Exercises in observing, expressing, and combining these ideas give training alike of mind, hand, and eye. In what other way can these ends be so well accomplished as through industrial drawing and manual training combined? And what can be better made the means of inculcating ideas of beauty, refinement, and morality?

The extent to which manual exercises may be introduced into public schools will no doubt be governed by certain peculiar limitations. To begin with, it is not expected that boys generally will be able to handle heavy tools until about thirteen years old. Give them, therefore, exercises in which the lighter means may be employed, such as glue, the jackknife, etc. Again, we are limited by the absolute impossibility of generally connecting with common schools work-shops and special

instructors. Furthermore, courses of study already overcrowded, and the lack of specially prepared teachers, are obstacles which the average country school, at least, cannot overcome. Industrial drawing is largely taught throughout the country. We would urge that exercises connected with it be arranged for an outgrowth of constructed objects. This is not only practicable, but applicable to all common schools. Depend upon willing parents, brothers, and sisters for whatever home instruction is necessary in the manual execution of the thought, and we shall at least have wisely directed the natural tendency of children to make things, and have aroused an interest which will assist materially in the establishment of special manual-training schools whenever they become practicable.

In conclusion we would say to teachers everywhere: Give one exercise to your pupils in the manner described, and we are confident that the interest which you will thus arouse will lead to others.

Charles M. Carter.

THE WHITE COWL.

IN a shadowy solitary valley of southern Kentucky, and beside a noiseless stream, there stands to-day a great French abbey of white-cowled Trappist monks.

It is the loneliest of human habitations. Though not a ruin, an atmosphere of gray antiquity hangs about and forever haunts it. The pale-gleaming cross on the spire looks as though it would fall to the earth, weary of its aged unchangeableness. The long Gothic windows; the rudely carven wooden crucifixes, suggesting the very infancy of holy art; the partly encompassing wall, seemingly built as though to resist a siege; the iron gate of the porter's lodge, locked against profane intrusion—all are the voiceless but eloquent emblems of a past that still enchains the memory by its associations as it once enthralled the reason by its power. Over the placid stream, and across the fields to the woody crests around, float only the sounds of the same sweet monastery bells that in the quiet evening air summoned a ruder world to nightly rest and pious thoughts of heaven. Within the abbey at midnight are heard the voices of monks chanting the self-same masses that ages ago were sung by others, who all night long from icy chapel floors lifted up piteous hands with intercession for poor souls suffering in purgatory. One almost expects to

see coming along the dusty Kentucky road which winds through the valley meek brown palmers just returning from the Holy Sepulcher, or through an upper window of the abbey to descry lance and visor and battle-ax flashing in the sunlight as they wind up a distant hill-side to the storming of some perilous citadel.

Ineffable influences, too, seem to bless the spot. Here, forsooth, some saint, retiring to the wilderness to subdue the devil in his flesh, lived and struggled, and suffered and died, leaving his life as an heroic pattern for others who in the same hard way should wish to win the fullest grace of Christlike character. Perhaps even one of the old monks, long since halting towards the close of his pilgrimage, will reverently lead you down the aisle to the dim sepulcher of some martyr, whose relics repose under the altar while his virtues perpetually exhale heavenward like gracious incense.

The beauty of the region, and especially of the grounds surrounding the abbey, thus seems but a touching mockery. What have these inward-gazing, heavenward-gazing souls to do with the loveliness of Nature, with the change of season or the flight of years, with green pastures and waving harvest-fields outside the wall, with flowers and orchards and vineyards within?

It was in a remote corner of the beautiful

gardens of the monastery that a young monk, Father Palemon, was humbly at work one morning some years ago amidst the lettuces and onions and fast-growing potatoes. The sun smote the earth with the fierce heat of departing June; and pausing to wipe the thick bead of perspiration from his forehead, he rested a moment, breathing heavily. His powerful legs were astride a row of the succulent shoots, and his hands clasped the handle of the hoe that gave him a staff-like support in front. He was dressed in the sacred garb of his order. His heavy sabots crushed the clods in the furrows. His cream-colored serge cowl, the long skirt of which would have touched the ground, had been folded up to his knees and tied with hempen cords. The wide sleeves, falling away, showed up to the elbows the superb muscles of his bronzed arms; and the calotte, pushed far back from his head, revealed the outlines of his neck, full, round, like a column. Nearly a month had passed since the convent barber

had sheared his poll, and his yellow hair was just beginning to enrich his temples with a fillet of thick curling locks. Had Father Palemon's hair been permitted to grow, it would have fallen down on each side in masses shining like flax and making the ideal head of a saint. But his face was not the face of a saint. It had in it no touch of the saint's agony — none of those fine subtle lines that are the material network of intense spirituality brooding within. Scant vegetarian diet and the deep shadows of cloistral life had preserved in his complexion the delicate hues of youth, noticeable still beneath the tan of recent exposure to the summer sun. His calm, steady blue eyes, also, had the open look peculiar to self-unconscious childhood; so that as he stood thus, tall, sinewy, supple, grave, bare-headed under the open sky, clad in spotless white, a singular union of strength, manliness, and unawakened innocence, he was a figure startling to come upon, picturesque to contemplate, profoundly interesting to study.

As he rested, he looked down and discovered that the hempen cords fastening the hem of his cowl were becoming untied, and walking to the border of grass which ran round the garden just inside the monastery wall, he sat down to secure the loosened threads. He was very tired. He had come forth to work before the first gray of dawn. His lips were parched with thirst. Save the little cup of cider and a slice of black bread with which he had broken his fast after matins, he had not tasted food since the frugal meal of the previous noon. Both weary and faint, therefore, he had hardly sat down before in the weakness of his flesh a sudden powerful impulse came upon him to indulge himself in a moment's repose. His fingers fell away from the untied cords,

his body sank backward against the trunk of the gnarled apple-tree by which he was shaded, and closing his eyes, he drank in eagerly all the sweet influences of the perfect day. For Nature was in an ecstasy. The sunlight never fell more joyous upon the unlifting shadows of human life. The breeze that cooled his sweating face was heavy with the odor of the won-

derful monastery roses. In the dark green canopy overhead two piping flame-colored orioles drained the last bright dew-drop from the chalice of a leaf. All the liquid air was slumbrous with the minute music of insect life, and from the honeysuckles clambering over the wall at his back came the murmur of the happy, happy bees.

What power have hunger and thirst and momentary weariness over the young? Father Palemon was himself most like a part of the pure and beautiful nature around him. His heart was like some great secluded crimson flower that is just ready to burst open in a passionate seeking of the sun. As he sat thus in the midst of Nature's joyousness and irrepressible unfoldings and peaceful consummations, he forgot hunger and thirst and weariness in a feeling of delicious languor. But beneath even this, and more subtle still, was the stir of restlessness and the low fever of vague desire for something wholly beyond his experience. He sighed and opened his eyes. Right before them, on the spire beyond the gardens, was the ancient cross to which he was consecrated. On his shoulders were the penitential wounds he had that morning inflicted with the knotted scourge. In his ears was the faint general chorus of saints and martyrs, echoing backward ever more solemnly to the very passion of Christ. While Nature was everywhere clothing itself with living greenness, around his gaunt body and muscular limbs — over his young head and his coursing hot blood — he had wrapped the dead white cowl of centuries gone as the winding-sheet of his humanity. These were not clear thoughts in his mind, but the vaguest suggestions of feeling, which of late had come to him at times, and now made him sigh more deeply as he sat up and bent over again to tie the hempen cords. As he did so, his attention was arrested by the sound of voices just outside the monastery wall, which was low here, so that in the general stillness they became entirely audible.

II.

OUTSIDE the wall was a long strip of woodland which rose gently to the summit of a ridge half a mile away. The woodland was but little used. Into it occasionally a lay brother drove the gentle monastery cows to pasture, or here a flock sheltered itself beneath forest oaks against the noontide summer heat. Beyond the summit lay the homestead of a gentleman farmer. As one descended this slope towards the abbey, he beheld it from the most picturesque side, and visitors at the homestead usually came to see it by this secluded approach. If

Father Palemon could have been beyond the wall, he would have discovered that the voices were those of a young man and a young woman—the former a slight, dark cripple, and invalid. He led the way along a footpath up quite close to the wall, and the two sat down beneath the shade of a great tree. Father Palemon, listening eagerly, unconsciously overheard the following conversation:

"I should like to take you inside the abbey wall, but of course that is impossible, as no woman is allowed to enter the grounds. So we shall rest here awhile. I find that the walk tires me more than it once did, and this tree has become a sort of outside shrine to me on my pilgrimages."

"Do you come often?"

"Oh, yes. When we have visitors, I am appointed their guide, probably because I feel more interest in the place than any one else. If they are men, I take them over the grounds inside; and if they are women, I bring them thus far and try to describe the rest."

"As you will do for me now?"

"No; I am not in the mood for describing. Even when I am, my description always disappoints me. How is one to describe such human beings as these monks? Sometimes, during the long summer days, I walk over here alone and lie for hours under this tree, until the influences of the place have completely possessed me and I feel wrought up to the point of description. The sensation of a chill comes over me. Look up at these Kentucky skies! You have never seen them before. Are there any more delicate and tender? Well, at such times, where they bend over this abbey, they look as hard and cold as a sky of Landseer's. The sun seems no longer to warm the pale cross on the spire yonder, the great drifting white clouds send a shiver through me as though uplifted snowbanks were passing over my head. I fancy that if I were to go inside I should see the white butterflies dropping down dead from the petals of the white roses, finding them stiff with frost, and that the white rabbits would be limping trembling through the frozen grass, like the hare in 'The Eve of St. Agnes.' Everything becomes cold to me—cold, cold, cold! The bleak and rugged old monks themselves, in their hoary cowls, turn to personifications of perpetual winter; and if I were in the chapel, I should expect to meet in one of them Keats's very beadsman,—patient, holy man, meager, wan,—whose fingers were numb while he told his rosary, and his breath frosted as it took flight for heaven. Ugh! I am cold now. My blood must be getting very thin."

"I do not discover thinness of blood in your description so much as a poetic imagination."

"At least the impression is a powerful one. I have watched these old monks closely. Whether it is from the weakness of vigils and fasts or from positive cold, they all tremble — perpetually tremble. I fancy that their souls shiver as well. Are not their cowls the grave-clothes of a death in life?"

"You seem to forget, Austin, that faith warms them."

"By extinguishing the fires of nature! Why should not faith and nature grow strong together? I have spent my life on the hill-side back yonder, as you know, and I have had leisure enough for studying these monks. I have tried to do them justice. At different times I have almost lived with St. Benedict at Subiaco, and St. Patrick on the mountain, and St. Anthony in the desert, and St. Thomas in the cell. I understand and value all the elements of truth and beauty in the lives of the ancient solitaries. But they all belong so inalienably to the past. We have outgrown the ideals of antiquity. How can a man now look upon his body as his evil tenement of flesh? How can he believe that he approaches sainthood by destroying his manhood? The highest type of personal holiness is said to be attained in the cloister. That is not true. The highest type of personal holiness is to be attained in the thick of all the world's temptations. Then it becomes sublime. It seems to me that all the heroisms worth speaking of nowadays are active, not meditative. But why should I say this to you, who as much as any one else have taught me to think thus — I who myself am able to do nothing? But though I can do nothing, I can at least look down upon the monastic ideal of life as an empty dead husk, into which no man with the largest ideas of duty will ever compress his powers. Even granting that it develops personal holiness, this itself is but one element in the perfect character, and not even the greatest one."

"But do you suppose that all these monks have deliberately and freely chosen their vocation? You know perfectly well that often there are almost overwhelming motives impelling men and women to hide themselves away from the world — from its sorrows, its dangers, its temptations."

"You are at least orthodox. I know that such motives exist, but are they sufficient? Of course there was a time when the cloister was a refuge from dangers. Certainly that is not true in this country now. And as for the sorrows and temptations, I say that they must be met in the world. There is no sorrow *befall-*

ing a man in the world that he should not *bear* in the world — bear it as well for the sake of his own character as for the sake of helping others who suffer like him. This way lie moral heroism and martyrdom. This way, even, lies the utmost self-sacrifice, if one will only try to see it. No, I have but little sympathy with such cases. The only kind of monk who has all my sympathy is the one that is produced by early training and education. Take a boy whose nature has nothing in common with the scourge and the cell. Immure him. Never let him get from beneath the shadow of convent walls or away from the sound of masses and the waving of crucifixes. Bend him, train him, break him, until he turns monk despite nature's purposes, and ceases to be a man without becoming a saint. I have sympathy for *him*. Sympathy! I do not know of any violation of the law of personal liberty that gives me so much positive suffering."

"But why suffer over imaginary cases? Such constraint belongs to the past."

"On the contrary, it is just such an instance of constraint that has colored all my thoughts of this abbey. It is this that has led me to haunt the place for years from a sort of sad fascination. Men find their way to this valley from the remotest parts of the world. No one knows from what inward or outward stress they come. They are hidden away here and their secret histories are buried with them. But the history of one of these fathers is known, for he has grown up here under the shadow of these monastery walls. You may think the story one of medieval flavor, but I believe its counterpart will here and there be found as long as monasteries rise and human beings fall."

"He was an illegitimate child. Who his father was, no one ever so much as suspected. When his mother died he was left a homeless waif in one of the Kentucky towns. But some invisible eye was upon him. He was soon afterwards brought to the boarding-school for poor boys which is taught by the Trappist fathers here. Perhaps this was done by his father, who wished to get him safely out of the world. Well, he has never left this valley since then. The fathers have been his only friends and advisers. He has never looked on the face of a woman since he looked into his mother's when a child. He knows no more of the modern world — except what the various establishments connected with the abbey have taught him — than the most ancient hermit. While he was in the Trappist school, during afternoons and vacations he worked in the monastery fields with the lay brothers. With them he ate and slept. When his education was finished he became a lay brother

himself. But amidst such influences the rest of the story is foreseen: in a few years he put on the brown robe and leathern girdle of a brother of the order, and last year he took final vows, and now wears the white cowl and black scapular of a priest."

"But if he has never known any other life, he, most of all, should be contented with this. It seems to me that it would be much harder

bind him until death. My father knew his mother and says that he is much like her — an impulsive, passionate, trustful, beautiful creature, with the voice of a seraph. Father Palemon himself has the richest voice in the monks' choir. Ah, to hear him, in the dark chapel, sing the *Salve Regina*! The others seem to moderate their own voices, that his may rise clear and uncommingled to the vaulted roof. But I be-

"HE BENT OVER IT, REVERENTIAL, WELL-NIGH AWE-STRICKEN."

to have known human life and then renounce it."

"That is because you are used to dwell upon the good, and strive to better the evil. No; I do not believe that he is happy. I do not believe nature is ever thwarted without suffering, and nature in him never cried out for the monkish life, but against it. His first experience with the rigors of its discipline proved nearly fatal. He was prostrated with long illness. Only by special indulgence in food and drink was his health restored. His system even now is not inured to the cruel exactions of his order. You see, I have known him for years. I was first attracted to him as a lonely little fellow with the sad lay brothers in the fields. As I would pass sometimes, he would eye me with all a boy's unconscious appeal for the young and for companionship. I have often gone into the abbey since then, to watch and study him. He works with a terrible, pent-up energy. I know his type among the young Kentuckians. They make poor monks. Time and again they have come here to join the order. But all have soon fallen away. Only Father Palemon has ever persevered to the taking of the vows that

lieve that it is only the music he feels. He puts passion and an outcry for human sympathy into every note. Do you wonder that I feel so strongly drawn towards him? I can give you no idea of his appearance. I shall show you his photograph, but that will not do it. I have often imagined you two together by the very law of contrast. I think of you at home in New York City, with your charities, your missions, your energetic, untiring beneficence. You stand at one extreme. Then I think of him at the other — doing nothing, shut up in this valley, spending his magnificent manhood in a never-changing, never-ending routine of sterile vigils and fasts and prayers. Oh, we should change places, he and I! I should be in there and he out here. He should be lying here by your side, looking up into your face, loving you as I have loved you, and winning you as I never can. O Madeline, Madeline, Madeline!"

The rapid, broken utterance suddenly ceased.

In the deep stillness that followed, Father Palemon heard the sound of a low sob and a groan.

He had sat all this time riven to the spot, and as though turned into stone. He had hardly breathed. A bright lizard gliding from out a crevice in the wall had sunned itself in a little rift of sunshine between his feet. A bee from the honeysuckles had lighted unnoticed upon his hand. All sounds had died away from his ears, which were strained to catch the last echoes of these strange voices from another world. Now all at once across the gardens came the stroke of a bell summoning to instant prayer. Why had it suddenly grown so loud and terrible? He started up. He forgot all priestly gravity and ran—fairly ran, headlong and in a straight course, heedless of the tender plants that were being crushed beneath his feet. From another part of the garden an aged brother, his eye attracted by the sunlight glancing on a bright moving object, paused while training a grape-vine and watched with amazement the disorderly figure as it fled. As he ran on, the skirts of his cowl, which he had forgotten to tie up, came down. When at last he reached the door of the chapel and stooped to unroll them, he discovered that they had been dragged over the dirt and stained against the bruised weeds until they were hardly recognizable as having once been spotless white. A pang of shame and alarm went through him.

III.

EVERY morning the entire Trappist brotherhood meet in a large room for public confession and accusation. High at one end sits the venerable abbot; beside him, but lower, the prior; while the fathers in white and the brothers in brown range themselves on benches placed against the wall on each side. It was near the close of this impressive ceremony that Father Palemon arose and, pushing the hood far back from his face, looked sorrowfully around upon the amazed company. A thrill of the tenderest sympathy shot through them. He was the youngest by far of their number and likeliest therefore to go astray; but never had any one found cause to accuse him, and never had he condemned himself. Many a head wearing its winter of age and worldly scars had been lifted in that sacred audience-chamber of the soul confessing to secret sin. But not he. So awful a thing is it for a father to accuse himself, that in utter self-abasement his brethren throw themselves prone to the floor when he rises. It was over the prostrate forms of his brethren that Father Palemon now stood up erect, alone. Unearthly spectacle! He began his confession. In the hushed silence of the great bare chamber his voice awoke such echoes as might have terrified the soul

had one gone into a vast vault and harangued the shrouded dead. But he went on, sparing not himself and laying bare his whole sin—the yielding to weariness in the garden; the listening to the conversation; most of all, the harboring of strange doubts and desires since then. Never before had the word “woman” been breathed at this confessional of devoted celibates. More than one hooded, faded cheek blushed secret crimson at the sound. The circumstances attending Father Palemon’s temptation invested it with an ancient horror. The scene, a garden; the tempter, a woman. It was like some modern Adam confessing his fall.

His penance was severe. For a week he was not to leave his cell, except at brief seasons of permission. Every morning he must scourge himself on his naked back until the blood came. Every noon he must go about the refectory on his knees, begging his portion of daily bread, morsel by morsel, from his brethren, and must eat it sitting before them on the floor. This repast was reduced in quantity a half. An aged deaf monk took his place in the garden.

His week of penance over, Father Palemon came forth too much weakened to do heavy work, and was sent to relieve one of the fathers in the school. Educated there himself, he had often before this taught its round of familiar duties. The school is situated outside the abbey wall on a hill-side several hundred yards away. Between it and the abbey winds the road which enters the valley above and goes out below, connecting two country highways. Where it passes the abbey it offers slippery, unsafe footing on account of a shelving bed of rock which rises on each side as a steep embankment, and is kept moist by overhanging trees and by a small stream that issues from the road-side and spreads out over the whole pass. The fathers are commanded to cross this road at a quick gait, the hood drawn completely over the face, and the eyes bent on the ground.

One sultry afternoon, a few days later, Father Palemon had sent away his little group of pious pupils, and seated himself to finish his work. The look of unawakened innocence had vanished from his eyes. They were full of thought and sorrow. A little while and, as though weighed down with heaviness, his head sank upon his arms, which were crossed over the desk. But he soon lifted it quickly, and with alarm. One of the violent storms which gather and pass so quickly in the Kentucky skies was rushing on from the south. The shock of distant thunder sent a tremor through the building. He walked to the window and stood for a moment watching the

rolling edge of the low storm-cloud with its plumes of white and gray and ominous dun-green colors. Suddenly his eyes were drawn to the road below. Around a bend a horse came running at full speed, uncontrolled by the rider. He clasped his hands and breathed a prayer. Just ahead was the slippery, dangerous footing. Another moment and horse and rider disappeared behind the embankment. Then the horse reappeared on the other side, without saddle or rider, rushing away like a forerunner of the tempest.

He ran down. When he reached the spot he saw lying on the road-side the form of a woman—the creature whom his priestly vows forbade him ever to approach. Her face was upturned, but hidden under a great wave of her long, loosened, brown hair. He knelt down and, lifting the hair aside, gazed down into it.

“*Ave Maria!*—Mother of God!” The disjointed exclamations were instinctive. The first sight of beautiful womanhood had instantly lifted his thought to the utmost height of holy associations. Indeed, no sweet face had he ever looked on but the Virgin’s picture. Many a time in the last few years had he, in moments of restlessness, drawn near and studied it with a sudden rush of indefinable tenderness and longing. But beauty, such as this seemed to him, he had never dreamed of. He bent over it, reverential, well-nigh awe-stricken. Then as naturally as the disciple John might have succored Mary, finding her wounded and fainting by the wayside, he took the unconscious sufferer in his arms and bore her to the school-room for refuge from the bursting storm. There he quickly stripped himself of his great soft cowl, and, spreading it on the bare floor, laid her on it, and with cold water and his coarse monk’s-handkerchief bathed away the blood that flowed from a little wound on her temple.

A few moments and she opened her eyes. He was bending close over her, and his voice sounded as sweet and sorrowful as a vesper bell:

“Do you suffer? Are you much hurt? Your horse must have fallen among the rocks. The girth was broken.”

She sat up bewildered and replied slowly:

“I think I am only stunned.—Yes, my horse fell.—I was hurrying home out of the storm.—He took fright at something and I lost control of him. What place is this?”

“This is the school of the abbey. The road passes just below. I was standing at the window when your horse ran past, and I brought you here.”

“I must go home at once. They will be

anxious about me. I am visiting at a place not more than a mile away.”

He shook his head and pointed to the window. A sudden gray blur of rain had effaced the landscape. The wind shook the building.

“You must remain here until the storm is over. It will last but a little while.”

During this conversation she had been sitting on the white cowl, and he, with the frankness of a wondering, innocent child, had been kneeling quite close beside her. Now she got up and walked to one of the windows, looking out upon the storm, while he retired to another window at the opposite end of the room. What was the tempest-swept hill outside to the wild, swift play of emotions in him? A complete revulsion of feeling quickly succeeded his first mood. What if she was more beautiful—far more beautiful—than the sweet Virgin’s picture in the abbey? She was a devil, a beautiful devil. Her eyes, her hair, which had blown against his face and around his neck, were the Devil’s implements; her form, which he had clasped in his arms, was the Devil’s subtlest hiding-place. She had brought sin into the world. She had been the curse of man ever since. She had tempted St. Anthony. She had ruined many a saint, sent many a soul to purgatory, many a soul to hell. Perhaps she was trying to send *his* soul to hell now—now while he was alone with her and under her influence. It was this same woman who had broken into the peace of his life two weeks before, for he had instantly recognized the voice as the one that he had heard in the garden and that had been the cause of his severe penance. Amidst all his scourgings, fasts, and prayers that voice had never left him. It made him ache to think of what penance he must now do again on her account; and with a sudden impulse he walked across the room, and, standing before her with arms folded across his breast, said in a voice of the simplest sorrow:

“Why have you crossed my pathway, thus to tempt me?”

She looked at him with eyes that were calm but full of natural surprise.

“I do not understand how I have tempted you.”

“You tempt me to believe that woman is not the devil she is.”

She was silent with confusion. The whole train of his thought was unknown to her. It was difficult, bewildering. A trivial answer was out of the question, for he hung upon her expected reply with a look of pitiable eagerness. She took refuge in the didactic.

“I have nothing to say about the nature of woman. It is vague, contradictory; it is anything, everything. But I *can* speak to

you of the lives of women: that is a definite subject. Some women may be what you call devils. But some are not. I thought that you recognized the existence of saintly women within the memories and the present pale of your church."

"True. It is the women of the world who are the devils."

"You know so well the women of the world?"

"I have been taught. I have been taught that if Satan were to appear to me on my right hand and a beautiful woman of the world on my left, I should flee to Satan from the arms of my greater enemy. You tempt me to believe that this is not true—to believe that the fathers have lied to me. You tempt me to believe that Satan would not dare to appear in your presence. Is it because you are yourself a devil that you tempt me thus?"

"Should you ask me? I am a woman of the world. I live in a city of more than a million souls—in the company of thousands of these women-devils. I see hundreds of them daily. I may be one myself. If you think I am a devil, you ought not to ask me to tell you the truth. You should not listen to me or believe me."

She felt the cruelty of all this. It was like replying logically to a child who had earnestly asked to be told something that might wreck its faith and happiness.

The storm was passing. In a few minutes this strange interview would end: he back to his cell again; she back to the world. Already it had its deep influence over them both. She, more than he, felt its almost tragical gravity, and was touched by its pathos. These two young human souls, true and pure, crossing each other's pathway in life thus strangely, now looked into each other's eyes, as two travelers from opposite sides of the world meet and salute and pass in the midst of the desert.

"I shall believe whatever you tell me," he said with tremulous eagerness.

The occasion lifted her ever-serious nature to the extraordinary; and trying to cast the truth that she wished to teach into the mold which would be most familiar to him, she replied:

"Do you know who are most like you monks in consecration of life? It is the women—the good women of the world. What are your great vows? Are they not poverty, labor, self-denial, chastity, prayer? Well, there is not one of these but is kept in the hearts of good women. Only, you monks keep your vows for your own sakes, while women keep them as well for the sakes of others. For the sake of others they live and die poor. Some-

times they even starve. You never do that. They work for others as you have never worked; they pray for others as you have never prayed. In sickness and weariness, day and night, they deny themselves and sacrifice themselves for others as you have never done—never can do. You keep yourselves pure. They keep themselves pure and make others pure. If you are the best examples of personal holiness that may be found in the world apart from temptation, they are the higher types of it maintained amidst temptations that never cease. You are content to pray for the world, they also work for it. If you wish to see, in the most nearly perfect form that is ever attained in this world, love and sympathy and forgiveness; if you wish to find vigils and patience and charity—go to the good women of the world. They are all through the world, of which you know nothing—in homes, and schools, and hospitals; with the old, the suffering, the dying. Sometimes they are clinging to the thankless, the dissolute, the cruel; sometimes they are ministering to the weary, the heart-broken, the deserted. No, no! Some women may be what you call them, devils—"

She blushed all at once with recollection of her earnestness. It was the almost elemental simplicity of her listener that had betrayed her into it. Meantime, as she had spoken, his quickly changing mood had regained its first pitch. She seemed to rise higher—to be arraigning him and his ideals of duty. In his own sight he seemed to grow smaller, shrink up, become despicable; and when she suddenly ceased speaking, he lifted his eyes to her, alas! too plainly now betraying his heart.

"And you are one of these good women?"

"I have nothing to say of myself; I spoke of others. I may be a devil."

For an instant through the scattering clouds the sunlight had fallen through the window, lighting up her head as with a halo. It fell upon the cowl also, which lay on the floor like a luminous heap. She went to it, and, lifting it, said to him:

"Will you leave me alone now? They must pass here soon looking for me. I shall see them from the window. I do not know what should have happened to me but for your kindness. And I can only thank you very gratefully."

He took the hand that she gave him in both of his, and held it closely awhile as his eyes rested long and intently upon her face. Then quickly muffling up his own in the folds of his cowl, he turned away and left the room. She watched him disappear behind the embankment below and then reappear on the opposite side, striding rapidly towards the abbey.

IV.

ALL that night the two aged monks whose cells were one on each side of Father Palemon's heard him tossing in his sleep. At the open confessional next morning he did not accuse himself. The events of the day before were known to none. There were in that room but two that could have testified against him. One was Father Palemon himself; the other was a small dark red spot on the white bosom of his cowl, just by his heart. It was a blood-stain from the wounded head that had lain on his breast. All through the dread examination and the confessions Father Palemon sat motionless, his face shadowed by his hood, his arms crossed over his bosom, hiding this scarlet stain. What nameless foreboding had blanched his cheek when he first beheld it? It seemed to be a dead weight over his heart, as those earth-stains on the hem had begun to clog his feet.

All day he went the round of his familiar duties faultlessly but absently. Without heeding his own voice, he sang the difficult ancient offices of the Church in a full volume of tone, that was heard above all the rich unison of the unerring choir. When, at twilight, he lay down on his hard narrow bed, with the leathern cincture about his gaunt waist, he seemed girt for some lonely spiritual conflict of the midnight hours. Once in the sad tumult of his dreams his outstretched arms struck sharply against some object and he awoke: it was the crucifix that hung against the bare wall at his head. He sat up. The bell of the monastery tolled 12. A new day was beginning. A new day for him? In two hours he would set his feet, as evermore, in the small circle of ancient monastic exactions. Already the westerling moon poured its light through the long windows of the abbey and flooded his cell. He arose softly and walked to the open casement, looking out upon the southern summer midnight. Beneath the window lay the garden of flowers. Countless white roses, as though censers swung by unseen hands, waved up to him their sweet incense. Some dreaming bird awoke its happy mate with a note prophetic of the coming dawn. From the bosom of the stream below, white trailing shapes rose ethereal through the moonlit air and floated down the valley as if journeying outward to some mysterious bourn. On the dim horizon stood the domes of the forest trees, marking the limits of the valley — the boundary of his life. He pressed his hot head against the cold casement and groaned aloud, seeming to himself, in his tumultuous state, the only thing that did not belong to

the calm and holy beauty of the scene. Disturbed by the sound, an old monk sleeping a few feet distant turned in his cell and prayed aloud:

"Seigneur! Seigneur! Oubliez la faiblesse de ma jeunesse! Vive Jésus! Vive la Croix!"

The prayer smote him like a warning. Conscience was still torturing this old man — torturing him even in his dreams on account of the sinful fevers that had burned up within him half a century ago. On the very verge of the grave he was uplifting his hands to implore forgiveness for the errors of his youth. Ah! and those other graves in the quiet cemetery garth below — the white-cowled dust of his brethren, moldering till the resurrection morn. They, too, had been sorely tempted — had struggled and prevailed, and now reigned as saints in heaven, whence they looked sorrowfully and reproachfully down upon him, and upon their sinful heaps of mortal dust, which had so foiled and clogged and baffled the immortal spirit.

Miserably, piteously, he wrestled with himself. Even conscience was divided in twain and fought madly on both sides. His whole training had left him obedient to ideas of duty. To be told what to do always had been for him to do it. But hitherto his teachers had been the fathers. Lately two others had appeared — a man and a woman of the world, who had spoken of life and of duty as he had never thought of them. The pale dark hunchback, whom he had often seen haunting the monastery grounds and hovering around him at his work, had unconsciously drawn aside for him the curtains of the world and a man's nobler part in it. The woman, whom he had addressed as a devil, had come in his eyes to be an angel. Both had made him blush for his barren life, his inactivity. Both had shown him which way duty lay.

Duty? Ah! it was not duty. It was the woman, the woman! The old tempter! It was the sinful passion of love that he was responding to; it was the recollection of that sweet face against which his heart had beat — of the helpless form that he had borne in his arms. Duty or love, he could not separate them. The great world, on the boundaries of which he wished to set his feet, was a dark, formless, unimaginable thing, and only the light from the woman's face streamed across to him and beckoned him on. It was she who made his priestly life wretched — made even the wearing of his cowl an act of hypocrisy that was the last insult to Heaven. Better anything than this. Better the renunciation of his sacred calling, though it should bring him the loss of earthly peace and eternal pardon.

The clock struck half-past 1. He turned back to his cell. The ghastly beams of the

setting moon suffused it with the pallor of a death-scene. God in heaven! The death-scene was there—the crucifixion! The sight pierced him afresh with the sharpest sorrow, and taking the crucifix down, he fell upon his knees and covered it with his kisses and his tears. There was the wound in the side, there were the drops of blood and the thorns on the brow, and the Divine face still serene and victorious in the last agony of self-renunciation. Self-renunciation!

“Lord, is it true that I cannot live to Thee alone?—And Thou didst sacrifice Thyself to the utmost for me!—Consider me, how I am made!—Have mercy, have mercy! If I sin, be Thou my witness that I do not know it!—Thou, too, didst love her well enough to die for her!”

In that hour, when he touched the highest point that nature ever enabled him to attain, Father Palemon, looking into his conscience and into the Divine face, took his final resolution. He was still kneeling in steadfast contemplation of the cross when the moon withdrew its last ray and over it there rushed a sudden chill and darkness. He was still immovable before it when, at the resounding clangor of the bell, all the spectral figures of his brethren started up from their couches like ghosts from their graves, and in a long, shadowy line wound noiselessly downward into the gloom of the chapel, to begin the service of matins and lauds.

v.

HE did not return with them when at the close of day they wound upward again to their solemn sleep. He slipped unseen into the windings of a secret passage-way, and hastening to the reception-room of the abbey sent for the abbot.

It was a great bare room. A rough table and two plain chairs in the middle were the only furniture. Over the table there swung from the high ceiling a single low, lurid point of light, that failed to reach the shadows of the recesses. The few poor pictures of saints and martyrs on the walls were muffled in gloom. The air was dank and noisome, and the silence was that of a vault.

Standing half in light and half in darkness, Father Palemon awaited the coming of his august superior. It was an awful scene. His face grew whiter than his cowl, and he trembled till he was ready to sink to the floor. A few moments, and through the dim doorway there softly glided in the figure of the aged abbot, like a presence rather felt than seen. He advanced to the little zone of light, the iron keys clanking at his girdle, his delicate fingers interlaced across his breast, his gray

eyes filled with a look of mild surprise and displeasure.

“You have disturbed me in my rest and meditations. The occasion must be extraordinary. Speak! Be brief!”

“The occasion *is* extraordinary. I shall be brief. Father Abbot, I made a great mistake in ever becoming a monk. Nature has not fitted me for such a life. I do not any longer believe that it is my duty to live it. I have disturbed your repose only to ask you to receive the renunciation of my priestly vows and to take back my cowl: I will never put it on again.”

As he spoke he took off his cowl and laid it on the table between them, showing that he wore a dark suit of citizen’s clothes beneath.

Under the flickering spark the face of the abbot had at first flushed with anger and then grown ashen with vague, formless terror. He pushed the hood back from his head and pressed his fingers together until the jeweled ring cut into the flesh.

“You are a priest of God, consecrated for life. Consider the sin and folly of what you say. You have made no mistake. It would be too late to correct it, if you had.”

“I shall do what I can to correct it as soon as possible. I shall leave the monastery to-night.”

“To-night you confess what has led you to harbor this suggestion of Satan. To-night I forgive you. To-night you sleep once more at peace with the world and your own soul. Begin! Tell me everything that has happened—everything!”

“It were better untold. It could only pain—only shock you.”

“Ha! You say this to me, who stand to you in God’s stead?”

“Father Abbot, it is enough that Heaven should know my recent struggles and my present purposes. It does know them.”

“And it has not smitten you? It is merciful.”

“It is also just.”

“Then do not deny the justice you receive. Did you not give yourself up to my guidance as a sheep to a shepherd? Am I not to watch near you in danger and lead you back when astray? Do you not realize that I may not make light of the souls committed to my charge, as my own soul shall be called into judgment at the last day? Am I to be pushed aside—made naught of—at such a moment as this?”

Thus urged, Father Palemon told all that had recently befallen him, adding these words:

“Therefore I am going—going now. I cannot expect your approval: that pains me.

But have I not a claim upon your sympathy? You are an old man, Father Abbot. You are nearer heaven than this earth. But you have been young; and I ask you, is there not in the past of your own buried life the memory of some one for whom you would have risked even the peace and pardon of your own soul?"

The abbot threw up his hands with a gesture of sudden anguish, and turned away into the shadowy distances of the room.

When he emerged again, he came up close to Father Palemon in the deepest agitation.

"I tell you this purpose of yours is a suggestion of the Evil Spirit. Break it against the true rock of the Church. You should have spoken sooner. Duty, honor, gratitude, should have made you speak. Then I could have made this burden lighter for you. But, heavy as it is, it will pass. You suffer now, but it will pass, and you will be at peace again — at perfect peace again."

"Never! Never again at peace here! My place is in the world. Conscience tells me that. Besides, have I not told you, Father Abbot, that I love her, that I think of her day and night? Then I am no priest. There is nothing left for me but to go out into the world."

"The world! What do you know of the world? If I could sum up human life to you in an instant of time, I might make you understand into what sorrow this caprice of restlessness and passion is hurrying you."

All sweetness had forsaken the countenance of the aged shepherd. His tones rung hoarse and hollow, and the muscles of his face twitched and quivered as he went on:

"Reflect upon the tranquil life that you have spent here, preparing your soul for immortality. All your training has been for the solitude of the cloister. All your enemies have been only the spiritual foes of your own nature. You say that you are not fitted for this life. Are you then prepared for a life in the world? Foolish, foolish boy! You exchange the terrestrial solitude of heaven for the battle-field of hell. Its coarse, foul atmosphere will stifle and contaminate you. It has problems that you have not been taught to solve. It has shocks that you would never withstand. I see you in the world? Never, never! See you in the midst of its din and sweat of weariness, its lying and dishonor? You say that you love this woman. Heaven forgive you this sin! You would follow her. Do you not know that you may be deluded, trifled with, disappointed? She may love another. Ah! you are a child — a simple child!"

"Father Abbot, it is time that I were becoming a man."

But the abbot did not hear or pause,

borne on now by a torrent of ungovernable feelings:

"Your parents committed a great sin." He suddenly lifted the cross from his bosom to his lips, which moved rapidly for an instant in silent prayer. "It has never been counted against you here, as it will never be laid to your charge in heaven. But the world will count it against you. It will make you feel its jeers and scorn. You have no father," — again he bent over and passionately kissed his cross, — "you have no name. You are an illegitimate child. There is no place for you in the world — in the world that takes no note of sin unless it is discovered. I warn you — I warn you by all the years of my own experience, and by all the sacred obligations of your holy order, against this fatal step."

"Though it be fatal, I must and will take it."

"I implore you! — God in heaven, dost thou punish me thus? — See! I am an old man. I have but a few years to live. You are the only tie of human tenderness that binds me to my race. My heart is buried in yours. I have watched over you since you were brought here, a little child. I have nursed you through months of sickness. I have hastened the final assumption of your vows, that you might be safe within the fold. I have staid my last days on earth with the hope that when I am dead, as I soon shall be, you would perpetuate my spirit among your brethren, and in time come to be a shepherd among them, as I have been. Do not take this solace from me. The Church needs you — most of all needs you in this age and in this country. I have reared you within it that you might be glorified at last among the saints and martyrs. No, no! You will not go away!"

"Father Abbot, what better can I do than heed the will of Heaven in my own conscience?"

"I implore you!"

"I must go."

"I warn you, I say."

"O my father! You only make more terrible the anguish of this moment. Bless me, and let me go in peace."

"Bless you?" almost shrieked the abbot, starting back with horror, his features strangely drawn, his uplifted arms trembling, his whole body swaying. "Bless you? Do this, and I will hurl upon you the awful curse of the everlasting Church!"

As though stricken by the thunderbolt of his own imprecation, he fell into one of the chairs and buried his head in his arms upon the table. Father Palemon had staggered

backward, as though the curse had struck him in the forehead. These final words he had never thought of — never foreseen. For a moment the silence of the great chamber was broken only by his own quick breathing and by the convulsive agitation of the abbot. Then with a rapid movement Father Palemon came forward, knelt, and kissed the hem of the abbot's cowl, and turning away went out.

Love — duty — the world; in those three words lie all the human, all the Divine, tragedy.

VI.

YEARS soon pass away in the life of a Trappist priest.

For shade to shade will come too drowsily,
And drown the wakeful anguish of the soul.

Another June came quickly into the lonely valley of the Abbey of Gethsemane. Again the same sweet monastery bells in the purple twilights, and the same midnight masses. Monks were again at work in the gardens, their cowls well tied up with hempen cords. Monks were once more teaching the pious pupils in the school across the lane. All the gorgeous summer came and passed beyond the southern horizon, like a mortal vision of beauty never to return. There were few changes to note. Only the abbot seemed to have grown much feebler. His hand trembled visibly now as he lifted the crosier, and he walked less than of yore among his brethren while they busied themselves with the duties of the waning autumn. But he was oftener seen pacing to and fro where the leaves fell sadly from the moaning choir of English elms. Or at times he would take a little footpath that led across the brown November fields, and, having gained a crest on the boundary of the valley, would stand looking far over the outward landscape into imaginary spaces, limitless and unexplored.

But Father Palemon, where was he? Amidst what splendors of the great metropolis was he bursting Joy's grape against his palate fine? What of his dreams of love and duty, and a larger, more modern stature of manhood?

LATE one chill, cloud-hung afternoon in November there came into the valley of Gethsemane the figure of a young man. He walked slowly along the road towards the abbey, with the air of one who is weary and forgetful of his surroundings. His head dropped heavily forward on his breast, and his empty hands hung listlessly down. At the iron gate of the porter's lodge entrance was refused him; the abbey was locked in repose for the night. Urging the importance of his seeing the abbot, he

was admitted. He erased a name from a card and on it wrote another, and waited for the interview.

Again the same great dark room, lighted by a flickering spark. He did not stand half in light and half in shadow, but hid himself away in one of the darkest recesses. In a few moments the abbot entered, holding the card in his hand and speaking with tremulous haste:

"'Father Palemon'? — who wrote this name, 'Father Palemon'?"

Out of the darkness came a low reply:

"I wrote it."

"I do not know you."

"I am Father Palemon."

The calm of a great sadness was in the abbot's voice, as he replied musingly:

"There — *is* — no — Father Palemon: he died long ago."

"O my father! Is this the way you receive me?"

He started forward and came into the light. Alas! No; it was not Father Palemon. His long hair was unkempt and matted over his forehead; his face pinched and old with suffering, and ashen gray except for the red spots on his cheeks. Deep shadows lay under his hollow eyes, which were blood-shot and restless and burning.

"I have come back to lead the life of a monk. Will you receive me?"

"Twice a monk, no monk. Receive you for what time? Until next June?"

"Until death."

"I have received you once already until death. How many times am I to receive you until death?"

"I beseech you do not contest in words with me. It is too much. I am ill. I am in trouble."

He suddenly checked his passionate utterance, speaking slowly and with painful self-control:

"I cannot endure now to tell you all that has befallen me since I went away. The new life that I had begun in the world has come to an end. Father Abbot, she is dead. I have just buried her and my child in one grave. Since then the one desire I have had has been to return to this place. God forgive me! I have no heart now for the duties I had undertaken. I had not measured my strength against this calamity. It has left me powerless for good to any human creature. All my plans were wrecked when she died. My purposes have gone to pieces. There is no desire in me but for peace and solitude and prayer. All that I can do now is to hide my poor, broken, ineffectual life here, until by God's will, sooner or later, it is ended."

"You speak in the extremity of present suffering. You are young. Nearly all your lifelines yet before you. In time Nature heals nearly all the wounds that she inflicts. In a few years this grief which now unmans you — which you think incurable — will wear itself out. You do not believe this. You think me cruel. But I speak the truth. Then you may be happy again — happier than you have ever been. Then the world will resume its hold upon you. If the duties of a man's life have appealed to your conscience, as I believe they have, they will then appeal to it with greater power and draw you with a greater sense of their obligations. Moreover, you may love again — ah! Hush! Hear me through! You think this is more unfeeling still. But I must speak, and speak now. It is impossible to seclude you here against all temptation. Some day you may see another woman's face — hear another woman's voice. You may find your priestly vows intolerable again. Men who once break their holiest pledges for the sake of love will break them again, if they love again. No, no! If you were unfit for the life of a monk once, much more are you unfit now. Now that you are in the world, better to remain there."

"In Heaven's name, will you deny me? I tell you that this is the only desire left to me. The world is as dead to me as though it never existed, because my heart is broken. You misunderstood me then. You misunderstand me now. Does experience count for nothing in preparing a man for the cloister?"

"I did misunderstand you once: I thought that you were fitted for the life of a monk. I understand you now: I do not make the same mistake twice."

"This is the home of my childhood, and you turn me away?"

"You went away yourself, in the name of conscience and of your own passion."

"This is the house of God, and you close its doors against me?"

"You burst them open of your own self-will."

Hitherto the abbot had spoken for duty, for his church, for the inviolable sanctity of his order. Against these high claims all the pent-up tenderness of his heart had weighed as nothing. But now as the young man, having fixed a long look upon his face, turned silently away towards the door, with outstretched arms he tottered after him and cried out in broken tones: "Stop! Stop, I pray you! You are ill. You are free to remain here a guest. No one was ever refused shelter — O my God! what have I done?"

Father Palemon had reeled and fallen fainting in the doorway.

In this life, from earliest childhood, we are trained by merciful degrees to brave its many sorrows. We begin with those of infancy, which, Heaven knows, at the time seem grievous enough to be borne. As we grow older we somehow also grow stronger, until through the discipline of many little sufferings we are enabled to bear up under those final avalanches of disaster that rush down upon us in maturer years. Even thus fortified, there are some of us on whom these fall only to overwhelm.

But Father Palemon. Unnaturally shielded by the cloister up to that period of young manhood when feeling is deepest and fortitude least, he had suddenly appeared upon the world's stage only to enact one of the greatest scenes in the human tragedy — that scene wherein the perfect ecstasy of love by one swift mortal transition becomes the perfect agony of loss. What wonder if he had staggered blindly, and if, trailing the habiliments of his sorrow, he had sought to return to the only place that was embalmed in his memory, as a peaceful haven for the shipwrecked? But even this quiet port was denied him.

INTO the awful death-chamber of the abbey they bore him one midnight some weeks later. The tension of physical powers during the days of his suspense and suffering, followed by the shock of his rejection, had touched those former well-nigh fatal ravages that had prostrated him during the period of his austere novitiate. He was dying. The delirium of his fever had passed away, and with a clear, dark, sorrowful eye he watched them prepare for the last agony.

On the bare floor of the death-chamber they sprinkled consecrated ashes in the form of a cross. Over these they scattered straw, and over the straw they drew a coarse serge cloth. This was his death-bed — a sign that in the last hour he was admitted once more to the fellowship of his order. From the low couch on which he lay he looked at it. Then he made a sign to the abbot, in the mute language of the brotherhood. The abbot repeated it to one of the attendant fathers, who withdrew and soon returned, bringing a white cowl. Lifting aside the serge cloth, he spread the cowl over the blessed cinders and straw. Father Palemon's request had been that he might die upon his cowl, and on this they now stretched his poor emaciated body, his cold feet just touching the old earth-stains upon its hem. He lay for a little while quite still; with closed eyes. Then he turned them upon the abbot and the monks who were kneeling in prayer around him, and said, in a voice of great and gentle dignity:

THE DEATH OF FATHER PALEMON.

"My father—my brethren, have I your full forgiveness?"

With sobs they bowed themselves around him. After this he received the crucifix, tenderly embracing it, and then lay still again, as if awaiting death. But finally he turned over on one side, and, raising himself on one forearm, sought with the hand of the other among the folds of his cowl until he found a

small blood-stain now faint upon its bosom. Then he lay down again, pressing his cheek against it; and thus the second time a monk, but even in death a lover, he breathed out his spirit with a faint whisper—"Madeline!"

And as he lay on the floor, so now he lies in the dim cemetery garth outside, wrapped from head to foot in his cowl, with its stains on the hem and the bosom.

James Lane Allen.

STAR TEARS.

WHEN softly mother earth is dreaming—sleeping,
I question whence the fire-flies come,
The moon says: "Tears they are from stars that weeping
Have lost the path which leads them home."

Eugene Ashton.

DOVES.

HE bird-fancier watches the bird in its haunts from a loving interest in its habits; but the student spies it out for material for his note-book, for reference when he shall have killed it, stuffed it with tow or the like, and added it to his collection of stiffs or skins.

The knowledge each gains differs as widely as his methods. The fancier recognizes the higher order of the scientist's work and respects his use of the alphabet—possibly because beyond him; but, though he may be a trifle awed that the simple bird of his love is considered worthy of it all, his appreciation and application of it ends there.

In the great family of the *Columbidae* the scientist finds the *Columbinæ*, *Lopholæminæ*, *Turturinaæ*, *Zenaidinaæ*, and more. These he breaks into subfamilies, varieties, and subvarieties, until there are names for almost the individual specimens. But dropping to plain prose and the vernacular, he seems lost. He says pigeon and dove, it is true, but it is a distinction without a difference. He plainly considers the terms synonymous. Thus the three most careful observers in America, Baird, Brewer, and Ridgeway, say, "the white-headed pigeon," and then refer to it as "this dove"; and "the Carolina dove," with a period between, becomes "this pigeon," and "the ground doves" "these pigeons." But this is no new thing. A half century ago Bonaparte complained of the lack of system in the use of these, the commonly used names. "The name dove," he said, "is applied to all the small pigeons, whilst the larger doves are known as pigeons. Even this distinction, however, does not seem to be agreed upon, as we find authors calling the larger species doves and the smaller ones pigeons, and sometimes applying both appellations to different ages and sexes of the same species."

This is all very abstruse and very absurd to the bird-lover. He recognizes a grand division of doves and pigeons for the entire family, and with the line of demarkation so distinctly drawn upon structural difference and natural habit that he cannot understand where there can be margin for doubt or uncertainty. This, of course, is because he knows only his one little way and cannot see beyond it.

The word "dove" conveys to his mind the impression of a slender, delicately built bird,

timid and solitary by nature; monogamous in habit; its feet formed for grasping; its tail feathers long, graduated, and rounded; its roost upon a perch; its nest in trees or shrubs; and its wings so formed that it is incapable of extended flight. Its love is of mate, but for home, fond as it is of it, it knows only the present place of nesting and resting; in domestication it must be kept within bounds.

The pigeon is altogether to the contrary. True, it is monogamous, but it is also gregarious, and never content unless in a crowd. Its foot is flat; its tail feathers short, of even length and cut straight across; and its roost and nest is, from choice, a broad, flat surface. Its love of mate is secondary to the love of place; and, once domiciled, it may be trusted with its liberty. The dove is shy and timid; but the pigeon—and the bird-lover will quote Willis—

Alone of the feathered race
Doth look unscared on the human face.

But the fancier finds still another difference, and this to him is conclusive. The doves or the pigeons, in all of their several varieties, may be mated and the offspring are fertile; but all his attempts to mate the pigeon and the dove are futile.

The pigeon, except as it is made a thing of beauty or grotesqueness by the artist breeder, or is enlisted in man's service or for his sport, holds but little to interest. But the dove attracts attention from the traditions and superstitions by which we know of it through all the past, and because of its intelligence and its pretty, curious ways.

The turtle-dove is the best known of the family. Of this there is the common; the collared; a cross of the two which is nameless, although resembling neither and reproducing its own peculiarities; and the white, which is a spot from the collared.

The common is *la Tourterelle* of Buffon. It is English, and although plentiful is not well known. Where other birds suffer from the harrier and the gunner, a superstition protects this. Every English lad knows that, "Molest the turtle-dove or disturb its nest, and the death of the dearest will be sure before the year is done." The plumage of *la Tourterelle* is of a rich dark brown and black above; the underfeathering of reddish brown at the throat, shading to fawn beneath. The wing coverts are black, tipped with brown. The peculiar

TURTLE-DOVES AND RING-DOVE.

marking is a patch of rich velvety, white-tipped black feathers at each side of the throat, but which do not appear until after the first molt.

The collared turtle or laughing dove is usually catalogued as the ring-dove, but this name belongs by right to the "cushie doo," or quest, the largest of the European doves. The col-

lared turtle, despite its mournful note, is the interesting member of the family; and, with its presence indicative of good luck and prosperity, it is a welcome guest everywhere, but especially among the middle and lower classes of Great Britain and Germany. Old mothers tell of it as a charm for illness if hung in the

patient's presence, borne out by the fact that the bird, naturally sensitive to atmospheric influences, quickly succumbs to the close air of the sick-room, when it is said to have "taken the disease." If the patient recovers, the bird has the credit; if death ensues, it was inevitable — "nothing could have helped."

above and white beneath. The neck is encircled with a white-edged band of black feathers not quite meeting at the throat. Its cooing is peculiar in the sound being deep, prolonged, and followed by a full stop in which the bird makes a deep obeisance. The bird can be so trained that when spoken to, or when a stranger

AUSTRALIAN CRESTED DOVE.

But the dove has had its place as a curative agent. "The eating of dove's flesh," says an old authority, "is of force against the plague, inasmuch that they who make it their ordinary diet are seldom seized with pestilential disorders. Some commend it against the palsy, or trembling; others, that it is of great use to them that have weak sight."

The collared turtle is of light fawn color

enters its presence, it will coo its welcome and make its courtesy, than which nothing can appear more absurd. This bird is very susceptible to atmospheric changes, and in its actions will predict the approach of storms or of clearing weather before the barometer will show it. In the autumn, as the light lessens, the dove, and especially this variety, even if bred in captivity, will become very uneasy, and if it can

WHITE-HEADED DOVE.

gain its liberty it will disappear. No amount of domestication or training can make the season of autumn migration other to it than a period of unrest and excitement.

"Gentle is that creature and pure," wrote St. John Chrysostom of the dove; ample proof that the good man had taken the bird on trust. Had he been a close observer of the dove of the aviary, and the turtle-dove in particular, he would not have been favorably impressed with the "dove-like disposition." It is not only quarrelsome, but cruel. When two or three are together there are bickerings, with blows for words, and all apparently for the love of the strife. So much for a fair appearance and a paper reputation.

During the nesting period milord is home-loving and paternal, and would be gentle, gracious, and loving if madame was not perverse, disobedient, and a gad-about. But the little lady has no fondness for home duties or the seclusion of the nest place. She likes better to sit in the sun preening her feathers, or to go

BAND-TAILED AND GROUND DOVES.

picking among the grasses or in the sand. The little fellow meantime sits patiently among the few twigs of his home furnishing and calls his mate. When she does not respond he seeks her out, and "his loving lessening not his ruling of her," he spares neither efforts nor blows to drive her to her home and to keep her to her duties.

The American birds most favored for the

PASSENGER PIGEON — CAROLINA DOVE.

aviary or the cage are the Carolina and the ground-doves. The former is about the size of the common turtle-dove, but is more hardy. Reared in confinement it is docile and affectionate, and may be taught many pleasing tricks and ways. Its plumage is modest, but at each side of the throat is a beauty spot, showing sometimes a deep red, and at others green and blue. This bird must be sheltered during the frost season, and be especially guarded during the period of autumnal migration.

The ground or moaning dove is scarcely larger than a sparrow, and at home is quite as fearless, although not as quarrelsome or impudent. It is hardly more than six inches in length. It may be bred successfully in the outdoor aviary in summer, or as a cage bird in-doors throughout the year. It requires but little care, and will make return in affectionate recognition. The little love whisper in which it responds when caressed is sweeter than any song.

Of the entire *Columbidæ*, the passenger of

our own United States has excited the greatest interest, and simply because of its gregarious habit, the entire species being assembled in the one flight. It is not local except as food attracts, but through the year ranges from the lakes to the gulf, and to the lakes again. March and April find the flight moving towards the breeding-grounds in the north, and in October it is journeying by slow stages to winter quarters in the south again.

This bird is as national in the colors of its plumage as in the limit of its range. Its head and back are blue, its throat and breast red, and its underfeathering white. The marking of the wing coverts, flights, and tail feathers is of black, the two middle feathers of the tail being wholly of that color. The neck, especially in the spring, is rich in iridescent hues. The eye is bright red, and the legs and feet purplish. The bird is the largest of the family, measuring fully sixteen inches. It breeds readily in confinement, and although quite hardy must be sheltered during the winter. Many attempts have been made to mate it with the blue-rock and other of the pigeons, in the hope of combining its endurance and supposed speed with their known intelligence and love of home, but without success, thus proving it to be not a pigeon, but a dove. It has, however, been bred with the Carolina dove, and the young, mated again with the Carolinas, have proven to be fertile. The naturalist Wilson is the authority for the wonderful speed with which this bird is generally credited; his assertions being based upon the condition of the food found in the crop hundreds of miles from the vicinity in which that food could have been obtained by it, and the rapidity of the pigeon's digestion. But this the racing pigeon has refuted in furnishing the proof that the food remains almost unchanged during the time the bird is on the wing; that is, the process of digestion and assimilation is stayed, or nearly so, during the time of flying.

In 1874 the flight of this variety centered in Benzie County, Michigan, for the breeding season, occupying a district about twenty miles long and five miles wide. At least such was the area of devastation caused by its immediate presence. There every branch and twig held a nest, and in every crotch sufficient to stay a few straws or sticks was a parent and egg or young. All verdure disappeared with the coming; and viewed from a distance, instead of a forest there was a dark moving mass, sometimes rising like smoke and again settling like a pall.

Previous to the nest building the air was continually alive with the flyers in the wild frolic of the mating season. As the building

began order was established to a degree, but it was not until the eggs were laid that a regular system prevailed. Then the males would take wing together at sunrise, rising from their roosts in a column, then spreading like a cloud through the air. Then an instant's delay and all were flying easily and steadily in the direction of the chosen feeding-grounds. Thousands of hens and eggs were ensconced in the branches, but not a bird rose above them, and all was still. A few hours later and the advance returned: then another flight and another, until finally the main body appeared, hovered over the forest for an instant, then each bird dropped to the perch beside the nest and mate. In the dense thicket of nests and birds each seemed to know its own. In a moment the whirl and rush of wings told that the hens had left the nest. There was the same column and cloud with which the males departed, and the same course was taken — no confusion, no delay, no apparent hesitation. At 3 o'clock in the afternoon these returned and the males again took wing, to be absent until near sundown.

But all that went out did not return. The roost in its season and the breeding-place is the choice of the birds and beyond human control; but the feeding-ground is where food is to be found, and in the selection of this man takes part. If birds are in the vicinity of a brook or spring, the waters of this are salted and the ground about is strewn with grain and salt. This the stragglers quickly find, and for a few days they are allowed to come and go at will, and as the food is eaten more is served. At each feeding-time the guests arrive in greater numbers, until finally the vast armies of male and female accept the spot as feeding-ground, and no amount of slaughter, driving, or fighting can keep them from it. Then the killing begins. Thousands and thousands fall victims, but the numbers in the flight are so great that the loss is not noticed. Later, when the market is glutted, man is wearied, beast has eaten to satiety, and the ground is hidden in the mass of debris and ungathered dead, the cloud that rises and settles above the roost seems just as dense and the area upon which it rested just as great, but the whirl of the wings has a softer sound. The mass is mainly of the young birds.

This mighty host came north early in the spring, while yet in New York and Michigan, where it settled, there was snow upon the ground. Nothing of seed, grain, or berry kind comes amiss with the passenger as food, and yet what was there in these States at this season in sufficient quantity to serve them? The question is one of exceeding interest.

EDWARD ROWLAND SILL.

FOR a poet is something light and with wings." No one ever said the difficult thing better than Plato, after all. "And cannot," proceeds the same authoritative voice,—“and cannot compose verses unless he be inspired.”

In our own immediate times verse-writing has become something more of the nature of a disease than of an honor. A species of rhymophobia pervades the cultivated world. Like the bite of the bitten victim, fashionable forms of construction extend. There is contagion in them. The strain for effect has become virulent. We feel, perforce, a sympathy with the half-playful but wholly earnest revolt of Dr.

Holmes against the epidemic character of our debilitated verse.

That overbalanced struggle for perfection of manner which stifles the spirit; the renaissance of obsolete forms which vitiates the modernness of sympathy so necessary to healthful work; the endless tricking and decking of little thoughts; the apparent unconsciousness of whether one's thought be large or little, or whether it be worth thinking at all, or if worth thinking, whether worth thinking in poetry—these qualities characterize so much of the verse of our day that one may be pardoned for becoming more aware of them than of some other and better traits which undoubtedly accompany them. It may be said that

there is a certain loss of the sense of proportion in our poetic power. By this I mean that higher proportion which is to proportion of form as the soul is to the human body. We do not build loftily. We do not live to last. We do not always know why we build at all. The result is a lack of architecture. But we have plenty of verse-carpentering; done as neatly as the service of Adam Bede, who thought the world was to be saved by conscientious day's labor. But the paper cap of the workman looks over the whole job.

There is a fatal gap in human energy which Emerson described as "thetstep between knowing and doing." This gap is nowhere deeper or steeper than in the step between rhyming and singing. But once taken, the step is as much of a fact as a bridge. Inspiration may falter, blunder, weaken. It can never be undone.

The first thing which one finds it natural to say about the writer whose beautiful work looks at us like half-blossomed flowers from his new-made grave is, that he did beyond all critical question take this step. Plato's great and simple definition includes him. He was outside of the ceramics of the poetic art. He did not give us bric-à-brac. We do not look for him in the department of household art decoration. He expressed himself, so far as he was expressed at all, by pure inspiration. One must not mistake the slight assumption of his work, its modesty, its reticence, its way — so like the author's own — of keeping in the background till sought, for the features of what we are most apt to mean by minor poetry. By pure quality, he was outside of this dead line.

In saying this we do not forget the incompleteness of his achievement in point of some respects which go to fix a man's place or his phase in the poetry of his times. His self-distrust may be called almost pitiful, in view of his creative quality. One might fancy that Death had his eye on that shrinking, exquisite nature which had but just rooted itself in our garden of poetry, and had suffered it to unfold only so far as to taunt us with a singular sense of our loss and the Destroyer's power. There is more pathos in his life and more irony than most lives and deaths could provide material for if they tried. And this true poet and true man never "tried." His life was as simple and as honest as that of a tree. He could not attitudinize. He never posed. His literary "effect" was the last thing he ever thought of. He cared more about being a genuine man than a recognized poet.

Nevertheless the truth remains that he had come at the hour of his untimely death to an enviable recognition, and that it was the recognition of a faith in his promise surpassing that in his performance. When he left us we

knew that we had a new poet. But we knew that we did not know how much we had in having him. His beautiful work was a prophecy. His best was yet to be. It was said by one of the greatest of critics of one of the greatest of poets that he "kept stern faith . . . with his fame." To keep faith with the promise of one's fame is a thing perhaps as much to be remembered; and this Sill has "sternly" done.

Edward Rowland Sill was a New England boy, with the suggestive antecedents which compose the best New England stock. His ancestry was English and Welsh — an affiliation which is apt to produce peculiarly interesting American character. The noticeable fact in the genealogy of the poet is its union of the scientific and the religious. His mother's father and grandfather were the pastors of the Congregational church in the little Connecticut village where the boy was born; the united ministry of these two covered a period of thirty-eight years. The child's grandfather went by the picturesque name of "Priest Rowland"; he was a man of great personal dignity both in appearance and character — a Puritan such as the Connecticut Valley loves. The father and grandfather of Sill were physicians and surgeons; and thus the fine combination of forces and the fierce conflict of elements begin. Impressive character and troubled faith follow such a heredity as naturally as commerce follows water, or the mists the meadows. Here again we find the well-established hereditary law, that the mother gives the guiding principle of being. It was immediately to his mother that the boy owed his poetic temperament. We are told that she was "an intellectual, quiet woman, fond of the few good books of the day, wrote verses, and had a tendency to melancholy." Whether because he was born his mother's son, or whether because he was born "light and with wings," need not be decided on the spot; but the "tendency to melancholy," as well as the tendency to "writing verses," came down to the sensitive little boy taking his first taste of life in sober Windsor. Sadness remained easy all his life. Yet he was a merry lad; he brimmed with mischief, and, like the saddest natures, continued to effervesce as the gladdest do, all his days. Such a temperament is like a marble gladiator hiding behind the spray of a fountain.

There seems to have been in his early history enough of those sources of melancholy by which domestic affliction feeds the temperament of sensitive children. We hear of the death of a brother by drowning; "an event which left Edward the only and idolized child." It is more than enough to add, that at twelve he lost his mother. His father soon followed her.

The orphan boy found his home with relatives to whom he seems to have been truly dear. He always attached people easily to himself. He was as lovable as Shelley. To those who knew him well enough to understand it, I might say that he was as lovable as Ariel. His preparatory education was obtained at Phillips Exeter Academy. His college was Yale. He graduated in 1861—the poet of his class, remembered by all Yale men of his time as the author of what it is safe to call one of the most remarkable class poems of collegiate history. It was the work of a man; it was the song of a poet. That poem was the one sure, young stroke, giving the ring which makes men watch each other's careers. Something was always expected of Sill after that. Yet he achieved late. His life went like the lives of other American teachers, in the daily struggle. Song was rare.

In college began the conflict which his heredity was sure to agitate as it was to give him his sad and strong blue eye. The religious and the scientific brain-cells challenged each other. The boy abandoned the faith of his fathers, and after some experience in teaching went to Harvard Divinity School to become the liberal preacher. This purpose, however, he put behind him quickly. "I can't ever preach," he writes to a friend; "that has slowly settled itself in spite of my reluctant hanging on to the doubt. I can't solve the problem: only the great school-master Death will ever take me through these higher mathematics of the religious principia. . . . I never can preach. I shall teach school, I suppose." The profession thus chosen he dignified and idealized to the end.

He was happily married in February, 1867, to his cousin Elizabeth N. Sill, and immediately thereafter moved to Brooklyn, New York, where he taught in a boys' school and did something as literary critic on the New York "Evening Mail." The high school and other experimental stages followed, ending in his acceptance of a call to the University of California as professor of English literature. This position he filled with honor and success for eight years. As a teacher, if not always "popular," he was passionately beloved. His scholars cherish his memory with the reverence which we give to the decisive spirit of our lives. He had genius for imparting wisdom as well as knowledge. He took the lives of his pupils to his heart. He controlled, he rebuked, he inspired, as one having authority that does not end in the class-room. His work was cheerful, healthful, vigorous. No one who loved him could mope or abandon the battle. As a teacher he illustrated Emerson's definition of a friend—"One who makes

us do what we can." His California life was brought to an end by his breaking health.

In Cleveland, Ohio, in February, 1887, on the 27th of the month, suddenly and unexpectedly, he died.

Mr. Sill's better work was done within the last few years of his life; as has been said, it was but the prologue to his best. His prose contributions to the magazines, especially to "The Atlantic Monthly," *THE CENTURY*, and to the "Contributor's Club" of the former periodical, were of a remarkably fine texture. He thought alertly, with a certain French graciousness and gracefulness of mind. His wide reading fortified his native power without encumbering it. The gift was too genuine for the pedagogic error. His English was that of the professor, pure and simple. But it was the poet's, varied, rich, delightful. It was the style of a poet trained in a class-room.

In the lost art of private correspondence he was an expert. In an experience not devoid of valuable correspondence with suggestive minds it has never been my personal lot to read such letters as Professor Sill's; they were crammed to the brim with vitality and vivacity. Thought enough went into them to have made the basis of those unwritten volumes which he was wont satirically to call "works." Style enough was hidden—I was going to say wasted—in them to have made the literary reputation of half a dozen authors of the economic kind; and heart enough—but his heart "was always with him." His intellect was passionate, sensitive; it throbbed. The beautiful memorial tribute published by his friends in California contains such material selected from Mr. Sill's correspondence as one does not remember to have seen since the letters of Frederick Robertson. It is a literary loss that so many of his letters are destroyed, or are of too personal a nature for present memorial publication. He had that leisure of the soul which is independent of all other leisures, temperamental, dominant and graceful; it is this which creates letters, it is this which moves a man to give to his friends as good as he gives to his publisher, or better. For this reason much of Sill's best prose we shall never have. The little that is ours carries us on like the best correspondence of the best French manner. They are quotable letters; in the detective phrase, they "shadow" us.

"It was music only to look at it," he says of the great organ in Boston.

A comet is "the spirit of a world hovering about and waiting to be incarnated."

I almost feel like deploring all fame when I see the fools that worship it. I always understood why Emerson made his poems rough—and I sympathize more than ever.

I am very sorry to hear of Mr. Lanier's death. His

book on English verse is the only thing extant on that subject that is of any earthly value. I wonder that so few seem to have discovered its great merit.

As to snow landscapes, — says it always looks like a Christmas card. Slaty blue woods, slaty blue sky, whity blue snow (and if you go softly into the woods, a slaty gray rabbit or two, with a slaty blue shadow on the snow).

Let a man write about himself. It's the only fellow he knows anything about.

My great comfort is that man can't take his learning or his culture out of this life with him — Death pushes back everything from the gate except the naked soul. Hence it does n't much matter that one can't study, and know this or that.

I am supposed to be entered on a mad career of literary work. Have so far only written some very mild verse — suitable for nursery use in some amiable but weak-minded family. But then I've been skating twice!

There's nothing here anyway except weather. Some it is fluid, and some it is frozen, and eke sometimes the mixture yeapt slush — but always weather. We sit down at breakfast and discuss the prospects of the day as to — weather. We report to each other the observations each has made casually during the night as to — weather. Some one tells how the barometer stands. . . . Some one else reports the direction of the wind — this is disputed by some one else. . . . At dinner there is a whole forenoon's weather to discourse upon and various prophetic intimations concerning the afternoon weather. At tea the day's weather furnishes the piece of resistance, with entrées of conjecture as to the morrow's prospect. You do not buy anything at the stores till you have compared views on this subject. Then you buy, and before you can get your change (cents you know, carefully counted) you must disclose your innermost and private views concerning not only to-day's weather, but yesterday's and that of the season in general. You also give your views briefly before you get to the door on the weather of Ohio compared to that of the Pacific slope. Then you hastily make a pacific slope out of the door.

The charm of his poetry is much more familiar to the public than that of his prose; and of the two charms it is the more his own and will be the more enduring. The most widely appreciated of his poems, "The Fool's Prayer," is too well known to need quotation in this magazine.

The fine stroke in "Opportunity" seems to me equally strong:

This I beheld, or dreamed it in a dream:
There spread a cloud of dust along a plain;
And underneath the cloud or in it raged
A furious battle, and men yelled, and swords
Shocked upon swords and shields. A prince's banner
Wavered, then staggered backward, hemmed by foes.
A craven hung along the battle's edge
And thought, "I had I a sword of keener steel —
That blue blade that the king's son bears — but this
Blunt thing!" — he snapt and flung it from his hand,
And lowering crept away and left the field.
Then came the king's son, wounded, sore bestead,
And weaponless, and saw the broken sword
Hilt-buried in the dry and trodden sand,
And ran and snatched it, and with battle shout
Lifted afresh he hewed his enemy down
And saved a great cause that heroic day.

To many of us one of his nearest poems is that plea for immortality which he called "The Invisible." It is too long for transcription here. A fragment stamps the porcelain:

If there is naught but what we see,
The friend I loved is lost to me. . . .

Because he never comes and stands
And stretches out to me both hands,
Because he never leans before
The gate when I set wide the door
At morning, nor is ever found
Just at my side when I turn round. . . .

For all this shall I homage pay
To Death, grow cold of heart, and say:
"He perished and has ceased to be;
Another comes, but never he?"
Nay, by our wondrous being, nay!
Although his face I never see
Through all the infinite To Be,
I know he lives and cares for me.

In another mood we have "Her Explanation":

. . . I am a lost illusion. Some strange spell
Once made your friend there, with his fine disdain
Of fact, conceive me perfect. He would fain
(But could not) see me always as befall
His dream to see me, plucking asphodel
In saffron robes on some celestial plain.
All that I was he marred and flung away
In quest of what I was not, could not be —
Lilith, or Helen, or Antigone. . . .

A woman best understands this poem. But it needs a poet to appreciate the workmanship of the last line.

The poem written for the Commencement at Smith College in 1883, and which added perceptibly to Mr. Sill's poetic reputation at the time, shows a quotation vitality which would have gained upon him, and which many of his poems have not:

Life is a game the soul can play
With fewer pieces than men say.

Were women wise, and men all true —
And one thing more that may not be,
Old earth were fair enough for me.

Not out of any cloud or sky
Will thy good come to prayer or cry.
Let the great forces wise of old
Have their whole way with thee.

. . . the better day
Gone not in dreams, nor even the subtle desire
Not to desire;
But work is the sober law.

But one drops the white "booklet" in which these delicate poems are now first collected for the public, with a conviction that reviewers and reviewing cannot do much better by Sill than they can by an oriole. He sings evasively, willfully; he sits upon the lightest, if not upon the farthest, twig, and mocks us. Most of his poems are complete strains; they cannot be interrupted; they do him no justice if caught in notes. He needs to be read and loved — or loved and read. Pascal said of "divine things" that they "must be loved to be known;" whereas other things are known to be loved. Sill is an individuality so delicate that one needs love it to understand its secret

strength; it is pliable, fine, finished; when you think that you have brushed a beautiful cobweb you find yourself held by a golden wire.

I began this paper, which assumes to be no more than the tribute of a friend to one whose "singing is all done," by saying that Sill stands among our poets upon the claim of pure inspiration. I am confident that a study of his delicate, fragmentary work will bring the reader at the end to the same conviction. He is a truly spontaneous being; he has no "made voice"; he sings because he cannot help it; as the birds do, as the waves do, like the winds; he is of his time, of his country, and of himself. The professional reviewer of that future into which the astral personality of this half-embodied poet may project itself will give us some day a study in comparison between Sill and that other, greater, but not dissimilar poet to whom in heart his friends have thought to liken him. Had he lived to do his best Sill might have been called the American Shelley. Temperamentally there is a kinship between the two. "Shelley," says Dowden, "was the most sensitive of human beings."—"One would at once pronounce of him that he was different from other men."—"There was an earnestness in his manner, and such perfect gentleness of breeding and freedom from everything artificial, as charmed every one."

Something in the countenance of Sill used to give us at moments the fancy of this likeness; they were the elfin moments, the elusive, evasive, perverse; when the eye lifted and lightened and the whole man withdrew from all men, and was apart from us, conforming but rebelling.

If Shelley had been born in Windsor, Connecticut, and taught school for a living, what should we have had? A kinship perhaps less difficult to defend between the English genius and the American professor.

And after all this brings us to say, it is not so sad a matter for even a poet to conform, even at the cost of being born in the Connecticut Valley, and of working out the daily task that chokes the singing sometimes. The heart of his friends holds Sill's memory precious, because he was simply so good, so true, so dear a man. He was all these things in measure beyond the common measure; this we know, who ever knew him. He was so brave, he was so patient, he forgot himself so easily, he remembered everybody else so instinctively, he had such supreme unselfishness, he had such sweetness of soul, that he stands among the few in our calendar of private saints. He called himself no saint. He groped for his religious faith and knew not that his blind hands grasped an ideal of Duty which might add consecration to the life of any believer of us

all. This fact was more Christ-like than too many of our ideals which dare take the Christian name upon them. I used to think that his awful struggle after Truth had brought him near to the altar of his unknown God, and that it was well to live as nobly as he did before one criticised him for the nominal loss of a faith whose second great commandment he did habitually and happily obey, and whose essential principle he touchingly and unconsciously represented.

He was a true poet; our literature is poorer for his untimely loss. But he was a true man; our lives are sadder for lack of his. Many who knew him mourn for him as for the dearest comforter they ever had. Friends in sorrow, young people in perplexity, shy people, poor people, the over-sensitive, neglected, lonely, misunderstood, he ministered to as only souls like his know how. It was a precious ointment that he poured from a costly box.

Dante, when asked at Santa Croce what he sought, said only: "Peace."

There was a look in Sill's sad eye which no one who ever saw it can ever forget. What he went seeking, as Nature forces search when she "makes a poet out of a man"—that, life never could have given him. Death is richer. Death is generous.

'Tis not in seeking,
'Tis not in endless striving,
Thy quest is found:
Be still and listen;
Be still and drink the quiet
Of all around.

Not for the crying,
Not for the loud beseeching,
Will peace draw near:
Rest with palms folded;
Rest with thine eyelids fallen—
Lo! peace is here.

Of his poems on death, which were strong and many, one other was indefinitely like him, and has been dear to many to whom he was dear:

What if some morning when the stars were paling
And the dawn whitened, and the East was clear,
Strange peace and rest fell on me from the presence
Of a benighted Spirit standing near:

And I should tell him, as he stood beside me,
This is our Earth—most friendly Earth and fair;
Daily its sea and shore through sun and shadow
Faithful it turns, robed in its azure air:

There is blest living here, loving and serving
And quest of truth and serene friendships dear;
But stay not, Spirit! Earth has one destroyer—
His name is Death; flee, lest he find thee here!

And what if then, while the still morning brightened
And freshened in the elm the Summer's breath,
Should gravely smile on me the gentle angel
And take my hand and say, "My name is Death."

Elizabeth Stuart Phelps.

THE UNIVERSITY AND THE BIBLE.

THE last word upon the relation of religion to education has not yet been spoken, and it is doubtful if it is soon heard. It is one of those questions which shows a tendency to recur after having been apparently settled. A few years ago the most thoughtful educators acquiesced in the opinion that religion could not be taught in the public schools and colleges, and compromised upon a teaching of ethics. The State universities omitted religious services altogether; some of the older colleges retained the services, but reduced them to one each Sunday and made attendance voluntary. The tendency has been towards an exclusion or reduction of religious services and instruction as a factor of education, with an attempt to compensate for the loss by encouragement of religious guilds, prayer-meetings, and other voluntary services and forms of religious work among the students themselves. That is, the tendency has been to lessen the institutional teaching of religion and to substitute for it voluntary and undirected self-teaching. The cause of this tendency is not to be found in the preference of thoughtful educators, but in the practical difficulty of dealing with students of all beliefs and no beliefs, reinforced by a pervasive cry that religion has nothing to do with education. There is evidently a reaction from this tendency, and a disposition to reconsider the whole question. There are but few who are ready to dispense with religious services in the colleges, but the question with them is: Is the service to be regarded simply as a ritual of worship, or as a part of the education of the student? If it is the former, attendance should be voluntary; if the latter, it may be made compulsory. It is the unsettled state of this question that breeds the hesitation and confusion in which the subject is now involved. The substitution of the voluntary, self-directed efforts of the students in prayer-meetings and guilds of various sorts is so suggestive of the blind leading the blind as to exclude it as a factor in the problem. It may be well to foster such forms of Christian activity, but to make students teachers of religion to their fellow-students is to violate student nature if not human nature. It is a matter that needs to be most carefully watched and tested by its results—the good accomplished weighed and

compared with the danger attending the religious sentiments set to tasks for which they are not yet ripe. No amount of such work, valuable as it may be in some respects, can be a substitute for religious education, and the question remains in full force whether or not the college should attempt in any way to teach religion.

The system of voluntary attendance, as at Harvard and Cornell, is logically a negative answer, or at best makes it an elective study; but it asserts the wisdom of associating worship, or the ritual of religion, with education. It teaches religion for those who care to come, but the service is essentially a service of worship. It may be said, in passing, that in both universities the system is productive of good personal results, but it cannot be said for it that it is a serious and logical effort to teach religion. It is a worthy effort to teach such students as come under its influence to be religious, but this is quite different from teaching religion. The system of compulsory attendance, as at Yale and many other colleges, combines the idea of worship and the teaching of religion. The compulsory feature is based, not on the fact that students must worship, but that they must be taught religion. The conception is traditional and is involved in the nature of the colleges as Christian institutions. Practically it still works well, and by reason of pleasant chapels, cushioned seats, good music, short sermons, and a single service meets but little opposition from the students; their free vote would probably show a large majority in favor of compulsory attendance. The college student is a much more tractable being than he was a generation since. Then he led a life of chronic opposition to his instructors; to-day it is a life of manly and sympathetic coöperation, the great gulf of dignity having been bridged by common sense and the modern spirit. It may be questioned, however, if teaching religion by compulsory attendance is much more than formal—a sign merely that religion is respected and believed in. As a service of worship for arousing and feeding the spiritual nature, and for many other ends, it has great value; but it does little towards teaching the students the nature of that great fact which is called the Christian religion, for the simple reason that it is a service of worship, and cannot, from its nature, be an occasion of scientific instruction.

My point is this: the religious services in our

universities and colleges, whether attendance is voluntary or compulsory, should be regarded primarily and chiefly as for worship and spiritual ministrations, and should not be regarded as a means of educating the students in the nature of the Christian religion; with the inference that if there is to be such education it should be dissociated from worship, and conducted in the same thorough and scientific way as the study of Greek or history. That is, if religion is to be taught in the university, it should be taught in the class-room and for the single end of education.

The bare proposal to do this is sufficient to call out the protest of every sect not identified with the institution and a louder protest from those of no sect — all laboring under the delusion that the teaching of religion implies a purpose to make the students religious and to convert them to the special beliefs of the instructor. The protest, in one sense, does credit to those who make it, because it shows in what a personal way religion is regarded; but it overlooks the question whether one can properly be considered an educated man who does not possess a thorough and scientific knowledge of the great fact known as the Christian religion.

Education may be defined as a training of the mind by study of the laws of nature and of the chief forces, facts, and processes of human society. The university does not aim primarily to secure convictions on these subjects, but to impart accurate knowledge of them, leaving the student to form his own opinions. The very function of education is to teach a man to think for himself upon the basis of full knowledge, and it is the opposite of its function to seek to impart opinions and convictions as such. The teacher of political economy who strives to force his preference for free-trade or protection upon his pupils forsakes scientific ground. Facts, principles, results, not a crusade nor stump-speeches, form the elements of university education. So it will teach evolution, but it will not aim to turn out evolutionists. There is, of course, a personal element in education, and the personal convictions of teachers are not only not to be disguised but to be made clear; still, the method of impression should be sought through the facts and principles of the subject.

The time seems to have come, or is drawing nigh, when the Christian religion can be taught in this way; that is, as a fact and by the scientific method. It is an achievement of the last half of the nineteenth century that all subjects can be studied dispassionately and simply as objects of study; it is the triumph of the inductive method. The modern spirit in education no longer aims to

produce Protestants or Roman Catholics or sectarians of any name, or followers of any school of politics; its emphasis is transferred from this final field of conviction to the previous field of fact. Facts — their nature and relation — form the basis of modern education. Thus any great fact or force becomes a legitimate object of study, under the principle that right belief can only come from full knowledge.

As the great facts and forces of human society are those which an educated man must understand, it becomes a question whether he can claim to be such unless he has a thorough scientific knowledge of the Christian religion. A mere sense of proportion would suggest that of the three forces which have entered into civilization — the Hebraic, the Greek, the Roman — he should understand the first as thoroughly as the other two; or that he should have as thorough a knowledge of the Christian as of the heathen classics; or that he should get as clear an insight into the nature of the force which Christianity lodged in the Roman Empire, and by which it took possession of it, as he gets of the nature of the Empire itself. It is clear that education at present has no true proportion; there is no proper coördination of its studies, and as the result we get a set of one-sided, partial thinkers.

But proportion and fitness aside, we claim that an American scholar is not properly equipped for his high place and work in society who does not thoroughly understand the religion of his country. An able educator, who is also an accomplished statesman, recently asserted this, without question, to the writer, adding that such a person was not entitled to a degree, and inferring that attendance upon church should be compulsory. The inference may not be the wisest alternative, but it emphasizes the earnestness of the opinion from which it was drawn; it recognizes the fact that the religion of a nation is one of its strongest forces and cannot be left out of account in any sort of dealing with the people. No man can understand the people, or get on well with them, or influence them in a practical way, without understanding their thought in religion. There will be a wide space between him and them not to be bridged by mere observation of their habits, or by silence or formal patronage. He must know their religion as well as they do in order to understand them and come into that intellectual and practical *rapproch* which is essential to successful dealing with them. Many a public man stumbles at this very point, not being able to measure the largest and most influential factor in the lives and thought of the people with whom he has to do. It is

easy to see the bearing of this point by transferring our thought to another nation. If a worldly-wise infidel were doing business with Mohammedans in Damascus or Bagdad he would, as a first requisite, master the Koran and engage a kneeling-rug in a mosque. There is a great deal of what is thought to be shrewd patronage of religion by public men in our country which misses its end because it is supported by so little knowledge: they rent a pew, but they cannot outwit the deacon; they flatter the preacher, but fail to capture him if they miss the point of the sermon. But the question goes deeper. Every nation, whatever its character, is imbedded in its religion. Religion colors life, impregnates opinions, shapes thought and action; it is a spirit that possesses the people consciously or unconsciously. The educated man, the man who deals with a community in a thorough way and who undertakes to handle large masses of men, must know the people in these sources of their feeling and action. He may not share in their beliefs, but he must understand them; and he cannot understand them except by a study of them and their sources. I think it is impossible to name a great American statesman who was without a thorough knowledge of the Bible; it is possible to name a large number of third and fourth rate politicians as ignorant of it as the student at Harvard who recently called upon the librarian for *The Acts*, with no suspicion that it formed a part of the Bible—ignorance matched by the senior at Yale who had no knowledge of the historical person known as Pontius Pilate. Evidently the Harvard man did not attend the voluntary service and the Yale man did not listen to the sermons of the compulsory service. These cases are not so amusing—they are not so uncommon as may be supposed—as they are suggestive of the possible slips these university graduates may make in the future. The courtroom, the Board of Education, the halls of Congress, the drawing-room, will show them little mercy, and the sneer will include Alma Mater. It is simply a fact that no small number of men graduate yearly from our colleges who have less knowledge of the Bible than have the children of a mission Sunday-school.

A public man in a Christian nation who does not thoroughly understand the Bible is exactly analogous to the lawyer who is not well versed in the common law; he may know the statutes, the rules of evidence, the precedents, but, not knowing the origin and soul of the whole matter, he knows nothing.

The value of the Bible as a text-book of history, of political science, of ethics, of literature, of comparative religion, has so often been discussed that we pass it by, simply reaffirm-

ing our point that a man who aspires to influence over the people and fails to educate himself in the Bible misses an essential element of power in dealing with them. It is a truism that the secret of educated influence is superior knowledge of the subjects that engage and mold the popular mind.

While it is not a part of the duty of the university to shape its curriculum with a view to secure specific religious beliefs, it may be expected of it to avoid, so far as possible, the result of infidelity in its graduates. If the latter is the alternative of the present system, it would justify a thorough reconstruction of it, for no one will deny that our universities aim to reënforce the fact that this is and should be kept a Christian nation. *Christo et Ecclesiæ* is the jealously guarded legend upon the seal of the oldest university, and in the broad spirit in which it is cherished there is it read by all. But in the present confusion of the subject and in the condition into which it is fast drifting,—religious services, voluntary here and compulsory there, and everywhere reduced to a minimum, scanty both as worship and as teaching, pieced out by the voluntary meetings of the few more serious minded, with occasional exhortations from a bishop or a metropolitan divine, or a first-class revivalist, and with no thorough and scientific teaching of the facts and literature of the Christian religion,—the question is whether the university is not unwittingly playing into the hands of infidelity by educating its students away from the religious conceptions in which they were reared and at the same time failing to supply them with better conceptions.

The great universities like Yale, Harvard, Princeton, Cornell draw their students from all parts of the country. Many of them come from regions where crude, antiquated, superstitious, and bigoted views of religion prevail; some of them have been reared in and may be members of such churches. Indeed, one need not go outside of the great metropolis to hear from the pulpits of leading churches the emphatic assertion that the veracity of Jesus Christ, and consequently the whole system of Christianity, depend upon the belief that Jonah was swallowed by a great fish—the logic being that if this event did not take place Jesus was either ignorant or a liar. When a student who has been brought up under such instruction as this comes to college he outgrows it by the simple force of education; but not being taught the true significance of the Book of Jonah, he becomes an infidel so far as that part of the Bible is concerned.

The popular teaching of the doctrines is hardly less crude, and it is certainly widely

divergent and antagonistic. Whole sects depend for existence on a single text of Scripture, or some metaphysical notion, or some theory of interpretation, or some particular conception of heaven and hell, or on some mode of administering a sacrament; and none of them can be said to be, as a whole, broad and intelligent and catholic in the sense in which these words are used in the university. The preacher in the college pulpit may belong to the same denomination as that from which some of his pupils have come; but while he looks at the Bible in a very different way from the home-pastor, he is careful not to antagonize and uproot his teaching. This may be wise, for the simple reason that he cannot, with his limited opportunities, supplant it by a better teaching: he wisely reasons that any faith is better than none; but not the less is the student, by the very force of his education, thrown out of his former beliefs, or driven to carry them along with a sort of forced faith as too sacred to be wholly given up, but too weak and unreal to endure thought and discussion. Hence the fact that the most reticent class upon religion in American society are its educated men: not because, as Mendelssohn said, "religion and thorough bass are subjects too sacred for discussion," but because they do not know what to say; they have been educated away from the crude interpretations of the Bible which they everywhere meet, but have not been educated into an intelligent perception of it. The sympathies of these men are for the most part with religion; they see its ethical and social value; while in college they perceived that men of great learning, talent, and mental integrity held firmly to the Christian religion. Students hear from such men teaching in the class-room upon science, ethics, history, and philosophy, which, by inference, is in conflict with the popular exegesis and theology, but the reconciliation or explanation they do not hear. There is an unconscious feeling among them that the faith of the instructors is held in an esoteric way. Many of the students under such teachers as Dr. Woolsey and Dr. Hopkins confessed to their moral power over them, but would have been doubly strengthened if they could have heard some fuller explanation of the reasons for the faith that was in these men. The college student of to-day suspects, and he is not wrong in his suspicion, that his instructors hold opinions in regard to Genesis, the composition of the Pentateuch, and inspiration of which they do not speak. They are quite right in their reticence; no sensible man raises a doubt or question in the minds of young men unless he can explain or answer it. But a hint, an occasional sermon, a bare assertion, is insufficient to treat these grave themes;

they can be properly treated only in the class-room and as a subject of scientific study.

The situation is this: the student comes to college with a conception of the Bible such as no longer is held in the university — a crude, unscientific, antiquated belief which he has been taught to identify with the Christian religion. He undergoes education; his faculties are strengthened, his perceptions are broadened; he is taught to analyze, and compare, and question, and to think for himself; he becomes acutely perceptive of what is in the intellectual and religious air; he is, above everything else, taught to be rational. This very process leads him to relax his hold upon what he had been taught to consider fundamental, with the inevitable tendency to give up the whole Bible. His religious training says one thing, his education says another; caught between these two seas, he is liable to make shipwreck of his faith or to stick fast in the shallows of indifference. Some of the weaker sort return to their communities and relapse into an undiscerning assent to the exegetical crudities of their youth, or perhaps lead in the cry against modern thought and German rationalism. More live on, silent, puzzled, conforming outwardly, assenting to the ethical value of almost any church and creed, but sentimentally leaving "theology to the parsons." A college education does two good things: it teaches a man to speak, and it also teaches him to be silent. If the trained men in the pews of many churches were to speak their minds, the pastors and elders would often be greatly amazed. Some run the full logical length of the conditions of their education and announce themselves as confirmed agnostics. They unlearned in college what they had learned at home; they felt the presence of opinions on sacred themes which were not expressed, and so rashly jumped to the conclusion of unbelief.

The pity of all this is that the university is full of teachers who could withstand these tendencies and conserve the faith in their pupils: Hebraists, devout men of science, Christian philosophers, exegetes who are capable not only of translating but of reading a written document — a rare, perhaps the rarest of gifts, that of interpretation. These men would gladly undertake this work, but are withheld from it by public opinion on the ground that it is not their business to teach religion. Nor is it; but we may well ask if it should not be made their business to avoid sending out their pupils with a bias towards infidelity or agnosticism. The fault is not with the university, but with the people. Is it too much to expect that public opinion can be led to make a distinction between teaching religion

as a matter of conscience, with the view to securing specific beliefs, and teaching the Bible in a purely scientific way, with the view to finding out what it means and what it does not mean? In itself considered, there is no just reason why the Koran should not be made a subject of scientific study in college if it could be made subservient to the student in his future calling. It is entirely possible in teaching the Bible to set the matter of personal religion and specific belief aside, desirable as they are, and to place it upon the same ground as an analytic study of the Prometheus. The Bible can be taught as dispassionately, as critically, and in the same cold, dry, scientific light, as Homer or the Ptolemaic system. If it be said that this is not the best way to teach the Bible, that it should be taught warmly and sympathetically and urgently, we assent; but as it cannot be so taught in the class-room, let it be taught in the next best way, which is the scientific way—that is, by a process of investigation to ascertain its meaning. Such study may not lead to moral belief, but it will not impede it; it may not yield personal faith, but it will tend to ward off infidelity; and it will certainly send out men who know what the Bible teaches and what it does not teach. There is something of such study in Yale University, chiefly as an elective; and philosophy and ethics are so taught as to reinforce Christian belief, with the result of a less degree of skepticism in the senior than in the junior year—which prompts the question whether if there were more of such teaching skepticism could not be reduced to very low terms. But the college student does not become skeptical on philosophical grounds so much as through difficulties found in the Bible; Genesis, and not the Philosophy of the Unconscious, saps his faith. Hence his first need is of a scientific explanation of the sacred books.

There is now no public sentiment that needs to be regarded which complains of the scientific study of any subject. If in some regions and from some sources there should be complaint at treating sacred themes in a scientific way, it is a complaint that the university must be ready to meet and to endure. It will lessen as the conception, now rapidly growing, gains ground, that all education is conducted in the scientific or inductive method. The teacher who now wages a warfare in his class-room in behalf of free-trade, or protection, or evolution, is behind his age. The true teacher is one who gives the facts, the principles, and the laws of his subject. If it be said that such a theory of education reduces it to a cold and colorless thing, it may be replied that the true teacher puts the warmth and color into the facts and laws. He may hide

as much conviction as he sees fit within such teaching, but he must not contradict the very law of education—namely, teaching the student to think and giving him matter for thought.

This method can be carried into a study of the Bible. Objection might come from three sources—strict sectarians, who regard the Bible as a fetich too sacred to be touched except in their own way; atheists and infidels, who nourish a contempt for the Bible as an antiquated piece of rubbish; and the devotees of culture, who vary the monotony of their agnosticism by temporary zeal for Classicism, Buddhism, and, of late, Mohammedanism. To the first it may be said, We do not propose to undermine your sect, but to send your students back to you with a better knowledge of the Book that you revere. To the second it may be said, This is still a Christian nation, and the Christian religion is a real factor and power in the life of the people. We do not require your students to become believers, but we do require of them to become familiar with a fact and a force which they will meet at every turn in their future careers. To the third it may be said, It is not improbable that, in your varying enthusiasms, you will soon come to take an interest in the Babylonian myths, or in the psychic element in the Hebrew prophet, or in a comparative study of Oriental and Western symbolism, in which case a thorough knowledge of the Book most intimately related to these subjects would not be amiss.

In order not to leave the subject in a vague condition, I will indicate, or rather hint, the direction such scientific study of the Bible might take.

Genesis: the nature, sources, and composition of the book.

The Pentateuch: its authorship and composition.

The Hebrew commonwealth: its nature and growth.

An outline of Jewish history.

The nature and meaning of such books as the Song of Solomon and Jonah.

The theism in the Psalms.

The argument in the Book of Job, and its literary features.

The Proverbs, and their relation to Oriental thought.

The Captivity, and its effect upon the nation.

An analysis of the Prophecy of Isaiah, and its literary features.

An outline of the life of Jesus Christ.

The sources of the Christian Church as found in The Acts.

Christian institutions: their origin.

The forces in Christianity which led to its reception and continuance.

WOMEN WHO GO TO COLLEGE.

It could be truthfully said thirty years ago that there was no system in woman's education, and one need not go far backward in the history of the subject to reach the time when, so far as any advanced instruction whatever is concerned, woman was almost completely overlooked. In the Middle Ages, when education was an accomplishment of the very few, and was considered a necessity for no one except the professional clerics, and not always for them, women had a chance to get the small measure of learning that was within the reach of common men. As the world in general grew wiser, women were left behind and were obliged to satisfy in private any scholarly longings that they might have, or to sit illiterate in their towers embroidering shields for graceless Launcelots and singing the "song of love and death."

It happened that at the time when Chaucer was in Italy learning the story of Patient Griselda,—in 1372,—the subject of the education of women was brought to the attention of a worthy father in France by thoughts of his three motherless daughters. He, the knight of La Tour Landry, was led to prepare a book to be used for the education of his own girls and of others. The treatise has been called a "monument of medieval literature." It is a phenomenally indecent book, and if it were exposed for sale to-day would be carried off by the police. This fond father limited the intellectual progress of his daughters to the reading of this book—and what reading! They might sew and brush and do the thousand and one housewifely works that have always been considered commendable in the sex; but as for any training of the mind, it could not be allowed. Down to our own time many persons have not advanced far beyond this father of La Tour Landry. They have thought that if women were suffered to eat of the tree of knowledge the rest of the family would at once "be reduced to the same kind of aërial diet," as Sydney Smith said; and have believed that an educated mother would be "in danger of deserting her infant for a quadratic equation." It was but the other day that a philosophical lecturer in a British capital declared that women, if educated, will cease to be sympathetic; they will be "cultured," but not "self-denying"; they will lack a thou-

sand nameless graces and charms of manner which uneducated women are probably supposed to possess.

It is not worth our while to contemplate the ages between Chaucer and our own days. We need only refer to Milton's scheme for education, confined as it was to men only. Any plan of instruction for the weaker sex was not to be expected from an author who could put into the mouth of his despondent hero the words:

Oh, why did God,
Creator wise, that peopled highest heaven
With spirits masculine, create at last
This novelty on earth, this fair defect
Of Nature, and not fill the earth at once
With men as angels?

The story of the progress of the education of women, even in the most favored portions of the world, is one of strange reluctance to give any advantage to the sex. Many of us have been taught to point to the inhabitants of New England as examples of remarkable care for education. We picture them as planting the school by the side of the meeting-house when they landed, and as building the college when the air was still lurid with the flames of their smoking cabins and their lives in danger from the tomahawk; but we forget that their schools were not for women. They thought that education was something adapted to fit a boy to be a minister, or to prepare him for some other liberal calling; but as for mothers and sisters, they might still sit and spin, they might embroider and cook, they might read and write (if they did not print anything), but as for looking into a work on science, or a book in Latin or Greek, that could hardly be imagined. Schools were provided, it is true, at an early period for "all children," but there was only one sex thought of in that connection. It is less than a century ago that a school was established in Boston for both boys and girls, and even then the girls were allowed to attend but half of the year. The first high school for girls was not opened there until 1825, and it was soon shut up because it was too expensive! Forty-five hundred dollars had been wasted in eight months on a few girls. They were after that kept out of the high school until 1852; and before 1877, when a Latin school was established for their special convenience, they were debarred from that mode of preparing for college.

In the mean time Vassar College had begun

its good work. The opening of that institution, in 1865, marks an era. During the years of civil war, when the armies of the republic were engaged in their great struggle and the fortunes of the nation hung in the balance, the millionaire of Poughkeepsie was quietly preparing the foundation for the first fully endowed institution for the collegiate instruction of women that the world ever saw. Mr. Vassar said that it was his intention to accomplish for women "what our colleges are accomplishing for men." This was simple enough and broad enough. It is charming to observe how deeply the pioneer trustees of this woman's college were impressed by the grandeur of their work, and how naïvely they expressed their sentiments. It was "of vital consequence"; it was "a grand and novel enterprise"; they were burdened with "responsibilities before the world"; they were "clothed by the majesty of the law with power" to carry out the generous purpose of the "munificent donor," whose act was excelled by none among the memorable events which signalized the early months of the year 1861, a time certainly rich in events of profound interest. They said that they looked forward to the opening of Vassar College as the beginning of a new era in the education of women.

The power of the time-honored opinions regarding the sphere of woman is plain enough. Deference to them led the projectors to lay much stress upon the domestic, home influences that were to be exerted; to warrant parents that there would be "comfort," and "abundant food"; that the students would be surrounded by "softening" and "elevating" influences — lest, perhaps, they should degenerate into barbarism! The idea was emphasized still more in the statement that there should be no day pupils, because there are no such in the home.

A protest was made against some of the methods that were said to be thoroughly established in our old institutions, and a determination was expressed that Vassar, having no traditions to bind it, should begin aright. It was assumed that the students would not be looking to the learned professions, like men, for teaching was at the time not supposed to fall into that category.

Arguments were brought against the usual order of college studies, and especially against the required four-years' course, then nearly universal. Vassar was to follow "the order of nature," and to make provision for "a diversity of tastes, aptitudes, and inclinations" — for different conditions and circumstances as to age, health, and property. The curriculum was to be no "bed of Procrustes, to which

every girl must adjust herself, however great the violence done to her nature." Students were not to be told that there was a certain number of text-books to be studied from Preface to Index each year, nor encouraged to plod contentedly through them in the best way they were able, whether the subjects proved attractive or not.

It was the plan of the first president and the founder that the college should be arranged in departments, and the students were to carry on their work by subjects, and be largely left to their own choice, though required to accomplish a definite amount before graduation; text-books were to be discarded from the class-room. Thus the tendency towards the elective system, now so strong in most colleges for men, and so much more desirable for women, was anticipated. The founders of the new college aimed at thorough and vigorous cultivation, rather than at too comprehensive and superficial training. The students were to be taught to "direct the faculties with their utmost power to the accomplishment of any task"; time was not to be taken into the account, in order to avoid feverish haste and to make it possible to cultivate the desired thoroughness without fear of falling behind in a race limited to four brief years. The college diplomas were to show that certain work had been done and well done, to represent something real, and not simply to indicate that the young woman had "been in college four years and paid her bills." Finally, Vassar promised to educate woman on the religious side, and to care assiduously also for her physical life. Acting in the spirit of the founder, the trustees declared that they "utterly loathed and repudiated" the spirit of sectarianism, and ordained that "all teaching of human creeds, dogmas, and ceremonials, of sectarian views and denominational distinctions," should be "strictly and forever forbidden."

Thus, upon a firm and broad foundation, Vassar began its work in 1865, and the first admission examinations showed that it was needed, for they proved that the education of woman at the time was confused, barren, undisciplined, wasteful, and superficial. The candidates had earnestness of purpose, but they did not know what they needed. They declared, in the language of the young lady of the day, that they were "passionately fond" of one study, and "utterly detested" another, though they were not well enough acquainted with either to give intelligent reasons for the tastes that they so strongly expressed. They thought, for instance, that chemistry was desirable, because it might help them in the kitchen; and French, because

it would serve in case of a foreign tour; though they had no knowledge of educational discipline and cared less for it.

No wonder that the faculty had difficulty in dealing with the students thus cast upon them. In the heterogeneous medley there were some who appreciated the difficulties, and supported their instructors in their efforts to set up and maintain a high standard, and by the end of the first year college opinion was all one way. The same sentiment has prevailed in all colleges for women; the students have uniformly demanded that the standard should be kept up, and that they should be submitted to the strictest tests required in any institution for men.

Collegiate instruction for women in America encountered the usual reception given to all innovations. Vassar College and its students became the objects of many weak jokes. The students were jibed at as women who "wanted to be men," as college women have been jibed at elsewhere. The name Vassar was carried everywhere. It became typical, and still is. Other colleges have risen, but Vassar remains the woman's college at which the small wit hurls his puny darts. The "Vassar girl" still stands for the girl who goes to college, and about her we hear all sorts of stories, more or less apocryphal. The new college encountered opposition from even good people; many had grave doubts; but the select few welcomed it, and it went steadily on its way. It was followed by Wellesley, Smith, Wells, and Bryn Mawr, and the "Harvard Annex," as it is called, also entered upon its successful career.

There is variety in the colleges for women. At Vassar the students are sheltered in one great building and are taught by both men and women. At Wellesley there was at first the same sort of grand dormitory, but it has become the center of a group which allows smaller clusters of students to gather under more home-like conditions. The teachers there are women only. At Smith men and women teach together, as at Vassar, but the students are separated into small groups under different roofs. The "Harvard Annex" has a character all its own. It did not seek to gather a new faculty, nor to erect imposing dormitories, but simply to repeat to women instruction already given to men in an institution that has been in successful operation two and a half centuries. It carries out the "home" principle farther than either Vassar or

Smith or Wellesley, for it aims to place its students by twos and by threes in established families.

Certainly woman has now obtained opportunity for the collegiate education. Wherever she has been admitted to college, and whenever she has been permitted to compete with men on equal terms for intellectual honors, she has done herself credit. Nowhere has this been so emphatically true as in conservative England. In a paper on the mental inferiority of woman to man, published in the "Nineteenth Century," it was shown that "the average brain-weight of women is about five ounces less than that of men," and by an elaborate and interesting argument woman's "marked inferiority of intellectual power" was proved in detail. We were told that women are more apt than men to break away from the restraints of reason; that they have greater fondness for emotional excitement of all kinds; that in judgment their minds are considerably below those of men; that in creative thought and in simple acquisition there is a marked difference; that women are less deep and thorough than men; that "their physique is not sufficiently robust to stand the strain of severe study," and so on.*

Scarcely had this argument for the general inferiority of women in "acquisition, origination, and judgment" reached us when the telegraph flashed the news that Miss Ramsay, a student at Girton College, Cambridge, England, had distanced all the men in the university in the race for classical honors, and that Miss Hervey, of the same college, had won like distinction in the department of Medieval and Modern Languages. The London "Times" said in this connection:

Miss Ramsay has done what no Senior Classic before her has ever done. The great names of Kennedy, Lushington, Wordsworth, Maine, and more recently of Butler and Jebb, have come first in the Classical Tripos; Miss Ramsay alone has been placed in a division to which no one but herself has been found deserving of admittance. . . . No one has ventured to think that four years' work could be enough to make a Senior Classic. We have proof that it is ample. Most of Miss Ramsay's competitors will have taken fourteen years to do less than she has contrived to do in four years. Miss Ramsay's example suggests a possibility that men may have something to learn in the management of a department of study which they have claimed as peculiarly their own.

To this it may be added that Miss Ramsay kept herself in full health, did not overwork, and accomplished her examinations easily.

* The author of this paper, Mr. George J. Romanes, writes with evident calmness and self-restraint. He frankly confesses that as a matter of fact he has met "wonderfully few cases of serious break-downs"; which only goes to show, he says, "of what good stuff our English girls are made." Since American observ-

ers notice the same phenomenon, we are at liberty to reply that the fact mentioned does *not* go to show "of what good stuff our English girls are made," but rather to prove that the "physique of young women as a class" is "sufficiently robust to stand the strain of severe study" and actually to improve under it.

In the face of facts like these and of many more that might be adduced, we cannot believe that nature has placed before woman any constitutional barrier to the collegiate life, but that so far as physical reasons are concerned, she may enter upon it with no more fear than a man may. That an increasing number of women will do this, and that it is best for the state that all should do it who are destined to be instructors of the youth of the republic, is in my mind not at all doubtful.

What is to be the result? That is the crucial question. On the physical health of the educated woman it will be beneficial. Observation, so far as it is now possible, shows that the work of the full college course is favorable to bodily health. The regularity of life, the satisfaction of attainment, the pleasant companionship, the general broadening of the girl-nature, tend in that direction. Speaking of "nervous or neuropathic" young women, Dr. Charles Follen Folsom, of the department of nervous diseases in the Boston Hospital, writes that it is his opinion that "the higher education is a conservative rather than a destructive force."*

On schools I have already said that the effect is good. The grade of instruction in establishments for girls has been materially raised since Vassar College began, and those pupils who go no further than the primary schools are much benefited. The influence is reflex, for the educated girls become in turn teachers, and they are better teachers than their predecessors. Many college-bred girls never teach. Neither do all college-bred men. They go out into the world and raise the average of general intelligence; they elevate their own households and exert an influence in the sphere of the private citizen. The standard is raised at home, and home is the fountain-head.

Women who marry after having been liberally educated make more satisfactory unions than they otherwise would have made. Women were formerly trained to no outlook but matrimony, and were encouraged to cultivate no accomplishments not considered useful to that end. When, therefore, that end was missed, all was missed. There was no outlet of action in which the energies of her feelings might be discharged. Such a defective education, adapted to heighten emotional sensibility, and to weaken the reasoning powers, tended to increase the predominance of the affective life and to lead woman to base her judgment upon feelings and intuitive perceptions rather than upon rational processes, and to direct

her conduct by impulse rather than to control it by will.

Educated women marry as naturally as others; but the fact that mental training has led them to subject their impulses to reason gives them an advantage in the choice of husbands, and it may well be expected that ill-considered marriages will be decreased in number. The rector of the University of Liège devoted his inaugural address in 1862 to the subject of the education of women, and remarked:

In Belgium and France most young persons in the higher classes—sons of the rich or of those who expect to be rich—are sunk in deplorable ignorance. They pursue no kind of higher studies, or if they enter upon them, they are very soon discouraged. To what does this tend? It causes them to be almost always without any inspiration to the taste, without any habit of serious occupation. They live in an atmosphere in which intellectual labor is not honored, in which, far from considering it a glorious or even a worthy duty, it is placed below the satisfaction of the love of pleasure. This deplorable situation arises from the false education given to the women of the higher classes. As a general rule they cannot comprehend what constitutes the true power and dignity of a man, and therefore they accept as husbands men as ignorant and as idle as themselves. As a natural consequence they cannot bring up their sons to be men; they cannot give to their country well-instructed, devoted, and energetic citizens.

I have been told, even in cultivated, intellectual circles, that a young woman had better be in the kitchen or laundry than in the laboratory or class-room of a college. "Women should be trained," such persons say, "to be wives and mothers." The finger of scorn has been lightly pointed at the mentally cultivated mothers and daughters who are unable to cook and scrub, who cannot make a mince-pie or a plum-pudding. Such persons forget with surprising facility all the cases of women who neglect the kitchen to indulge in the love-sick sentimentality to which they have been trained; who think too much of possible matrimonial chances to endanger them by scrubbing, or by giving ground for the suspicion that they cultivate any other faculty than the power to apostrophize the moonlight and to long for a lover. They do not care to remember that it is no whit better to wither under the influence of ignorance or sentiment, to cultivate a fondness for "gush," than to dry up the sensibilities like a book-worm, or grow rigid and priggish as a pedant. It is as bad to stunt human nature as to over-stimulate it—to stop its progress in one way as in another. The danger is in going to extremes. The mass of men choose the golden mean, and we may trust women to avoid extravagance in the pursuit of learning. We may and ought to give her every help in the direction of life that her brothers possess. It is no

* "Relations of our Public Schools to the Disorders of the Nervous System," p. 187.

longer doubtful, it is plain, that whatever other rights woman should have, those of the intellectual kingdom ought to be hers fully and freely. She should be the judge herself of how far she should go in exploring the mysteries of nature and of science.

It is not a question of putting all our girls through college; it is not even a question of their being taught in the same institutions and

classes with men when they go to college. The form in which women shall be taught and the subjects that they shall study are of minor importance at the moment, and time will settle them in a natural way. The great desideratum is that they be given the collegiate education when they need it, and that they be the judges of their own needs.

Arthur Gilman.

BIRD MUSIC.

Some approaches the haunts of the yellow-breasted chat, the old rule for children is reversed—he is everywhere heard, nowhere seen. Seek him ever so slyly where the ear has just detected him, instantly you hear him elsewhere; and this with no sign of a flight. The chat revels in eccentricities. Some tones of his loud voice are musical, others are harsh; and he delights in uttering the two kinds in the same breath, occasionally slipping in the notes of other birds and, on some authorities, imitating those of quadrupeds. I have discovered in his medleys snatches from the robin, catbird, oriole, kingfisher, and brown thrasher. Wilson refers to his “great variety of odd and uncouth monosyllables.” I have detected three such, “char,” “quirp,” and “whirr,” and they were given with distinctness.

The male birds, generally preceding the females in their migrations, locate and at once begin a series of vocal and gymnastic exercises. A marked example of these performances is a jerky flight straight upwards perhaps fifty feet, and a descent in the same fussy fashion. (Though this exhibition is eminently characteristic of the chat, one observer informs me that he has seen the woodcock and the linnet so employed.) The favorite time for it is just before dusk; but if there be a moon, a carousal of some sort goes on all night, the evident intention being to let no migrating lady-chat pass without a hearty invitation to cease her wandering, and to accept a husband and a home.

After all, the chat can hardly be said to have a song. The longest strain that I have heard from him is without melody, closely resembling the rhythmic movement of the yellow-billed cuckoo's effort, but wholly unlike it in quality of tone. He will burst out with loud,

rapid tones, then suddenly retard and diminish to the close:

In the course of an hour I have heard this strain repeated many times, and am satisfied that it has no one pitch or key. The following are the principal notes of this chat, but it is not to be understood that they always come in like order:

Quirp, quirp. (3)

Quirp, char, char.

Charr, charr, charr.

Whirr, whirr, whirr.

BOBOLINK.

THE mere mention of his name incites merriment. Bobolink is the embodiment of frolic song, the one inimitable operatic singer of the feathered stage. Though the oriole has a stronger and more commanding voice, and the thrushes far surpass him in deep, pure, and soul-stirring tones, he has no rival; even the mocking-bird is dumb in his presence. In the midst of his rollicking song he falls with bewitching effect into a ventriloquous strain, subdued, as if his head were under his wing; but soon the first force returns with a swell, and he shoots up into the air from the slender twig upon which he has been singing and swinging in the wind, looks with indifference upon everything beneath him, plying just the tips of his wings to paddle himself along in his reckless hilarity, twisting his head this way and that, increasing in ecstasy till he and his song drop together to the ground.

During his short but glorious reign bobolink takes the open meadow, the broad sunlight, all day long. When he would sing his best, he invariably opens with a few tentative notes, softly and modestly given, as much as to say, "Really, I fear I'm not quite in the mood to-day." It is a musical gurgling:

Then the rapturous song begins, and a gradual crescendo continues to the end. A few of the first notes of the song proper are:

His tonic is F major or D minor, and he holds to it, his marvelous variations being restricted to the compass of an octave, and the most of his long song to the interval of a sixth. A long song and a strong song it is, but though the performer foregoes the rests common among other singers, like the jeweler with his blow-pipe, he never gets out of breath.

Perhaps we have no more interesting, more charming, summer guest. When Nature clothes the fields with grass and flowers, he throws aside his common brown wear for new plumage, gay as it is unique. This striking change is a new birth; he neither looks, acts, sings, nor flies as he did before, nor could you guess him out. In both heart and feather he is

brightness itself. Most birds are dark above and light below; but this bird, in the new birth, takes the exact reverse. His breast and lower parts are black, his back, neck, and crown white, shaded with yellow seams. He reaches New England about the middle of May, with his plumage perfect and his song come to its fullness.

WHIP-POOR-WILL.

No bird in New England is more readily known by his song than is the whip-poor-will. He has a strong voice and sings his name distinctly, accenting the first and last syllables, the last most. At each singing he simply repeats his name an indefinite number of times, always measuring his song with the same rhythm while varying the melody. A peculiar feature of his performance is a cluck, which, introduced after each "whip-poor-will," serves as a pleasing rhythmic link to hold the song unbroken. If not near the bird, one fails to hear the cluck, noticing a rest in its place. The whip-poor-will does not stand erect when singing; his wings are slightly extended and kept in a rapid tremor. Various forms of the whip-poor-will's song:

Simeon Pease Cheney.

EXILE BY ADMINISTRATIVE PROCESS.

EW pages in my Siberian notebooks are more suggestive of pleasant sensations and experiences than the pages that record the incidents of our life in the mountains of the Altai. As

I now turn over the flower-stained leaves dated "Altai Station, August 5, 1885," every feature of that picturesque Cossack village comes back to me so vividly, that, if for a moment I close my eyes, I seem to hear again the musical plash and tinkle of the clear, cold streams that tumble through its streets; to see again the magnificent amphitheater of flower-tinted slopes and snowy peaks that encircles it; and to breathe once more the fresh, perfumed air of the green alpine meadow upon which it stands. If the object of our Siberian journey had been merely enjoyment, I think that we should have remained at the Altai Station all summer; since neither in Siberia nor in any other country could we have hoped to find a more delightful place for a summer vacation. The pure mountain air was as fragrant and exhilarating as if it had been compounded of perfume and ozone; the beauty and luxuriance of the flora were a never-failing source of pleasure to the eye;* the clear, cold mountain streams were full of fish; elk, argali, wild goats, bears, foxes, and wolves were to be found by an enterprising hunter in the wooded ravines and the high mountain valleys south of the station; troops of Kirghis horsemen were ready to escort us to the Mongolian boundary post, to the beautiful alpine lake of Marka Kul, or to the wild, unexplored fastnesses of the Chinese Altai; and Captain Maiefski, the hospitable commandant of the post, tempted us to prolong our stay, by promising to organize for us all sorts of delightful excursions and expeditions. The season of good weather and good roads, however, was rapidly passing; and if we hoped to reach the mines of Kara before winter should set in, we had not a day to spare. It was already the first week in August, and a distance of 2500 miles lay between us and the head-waters of the Amur.

Our next objective point was the city of Tomsk, distant from the Altai Station about 750 miles. In order to reach it we should be

obliged to return over a part of the road which we had already traversed, and to descend the Irtysh as far as the station of Pianoyarofskaya. At that point the road to Tomsk leaves the Semipalatinsk road, and runs northward through the great Altai mining district and the city of Barnaul. There were two colonies of political exiles on our route — one of them at the Cossack station of Ulbinsk, 160 miles from the Altai Station, and the other in the town of Ust Kamenogorsk. In each of these places, therefore, we purposed to make a short stay.

On the morning of Thursday, August 6, we packed our baggage in the tarantas, ordered horses from the post station, took breakfast for the last time with Captain Maiefski and his wife, whose kindness and warm-hearted hospitality had made their house seem to us like a home, and after drinking to the health of all our Altai friends, and bidding everybody good-bye three or four times, we rode reluctantly out of the beautiful alpine village and began our descent to the plains of the Irtysh.

It is not necessary to describe our journey down the valley of the Bukhtarma and across the gray, sterile steppes of the upper Irtysh. It was simply a reversal of the experience through which we had passed in approaching the Altai Station three weeks before. Then we were climbing from the desert into the alps, while now we were descending from the alps to the desert.

At 6 o'clock Friday afternoon we reached the settlement of Bukhtarma, where the Irtysh pierces a great out-lying spur of the Altai chain, and where the road to Ust Kamenogorsk leaves the river and makes a long détour into the mountains. No horses were obtainable at the post station; the weather looked threatening; the road to Alexandrofskaya was said to be in bad condition owing to recent rains; and we had great difficulty in finding a peasant with "free" horses who was willing to take our heavy tarantas up the steep, miry mountain road on what promised to be a dark and stormy night. With the coöperation of the station master, however, we found at last a man who was ready, for a suitable consideration, to make the attempt, and about an hour before dark we left Bukhtarma for Alexandrofskaya with four "free" horses. We soon had occasion to regret that we had not taken the advice of our driver to stop at Bukhtarma for the night and cross the mountains

* I brought back with me from the Altai an herbarium consisting of nearly a thousand species of flowering plants.

THE ALEXANDROFSKAYA-SEVERNAVA RAVINE.

by daylight. The road was worse than any neglected wood-road in the mountains of West Virginia; and before we had made half the distance to Alexandrofskaya, night came on with a violent storm accompanied by lightning, thunder, and heavy rain. Again and again we lost the road in the darkness; two or three times we became almost hopelessly mired in bogs and sloughs; and finally our tarantas capsized, or partly capsized, into a deep ditch or gully worn out in the mountain-side by falling water. The driver shouted, cursed, and lashed his dispirited horses, while Mr. Frost and I explored the gully with lighted wisps of hay, and lifted, tugged, and pulled at the heavy vehicle until we were tired out, drenched with rain, and covered from head to foot with mud; but all our efforts were fruitless. The tarantas could not be extricated. From this predicament we were finally rescued

by the drivers of three or four telegas, who left Bukhtarma with the mail shortly after our departure, and who overtook us just at the time when their services were most needed. With their aid we righted the capsized vehicle, set it again on the road, and proceeded. The lightly loaded telegas soon left us behind, and knowing that we could expect no more help from that source, and that another capsize would probably end our travel for the night, I walked ahead of our horses in the miry road for half or three-quarters of an hour, holding up a white handkerchief at arms-length for the guidance of our driver, and shouting directions and warnings to him whenever it seemed necessary. Tired, at last, of wading through mud in Cimmerian darkness, and ascertaining the location of holes, sloughs, and rocks by tumbling into or over them, I climbed back into the tarantas and wrapped myself up in a

THE ULBINSK RAVINE.

wet blanket, with the determination to trust to luck. In less than fifteen minutes our vehicle was again on its side in another deep gully. After making a groping investigation by the sense of touch, we decided that the situation this time was hopeless. There was nothing to be done but to send the driver on horseback in search of help, and to get through the night as best we could where we were. It was then about 11 o'clock. The wind had abated, but the rain was still falling, and the intense darkness was relieved only by an occasional flash of lightning. Cold, tired, and hungry, we crawled into our capsized vehicle, which still afforded us some little shelter from the rain, and sat there in sleepless discomfort until morning. Just before daylight our driver returned with a Cossack from Alexandrofskaya, bringing lanterns, ropes, crowbars, and fresh horses, and with these helps and appliances we succeeded in righting the tarantas and dragging it back to the road.

We reached Alexandrofskaya in the gray light of early dawn, and after drinking tea and sleeping two hours on the floor in the post station, we resumed our journey with eight horses and three drivers. The road from Al-

exandrofskaya to Severnaya runs for five or six miles up the steep, wild ravine that is shown in the illustration on page 721. It then crosses a series of high, bare ridges running generally at right angles to the course of the Irtysh, and finally descends, through another deep, precipitous ravine, into the valley of Ulbinsk, which it follows to Ust Kamenogorsk. The mountains which compose this spur, or out-lying branch, of the Altai system are not high, but, as will be seen from the illustration on the opposite page, they are picturesque and effective in outline and grouping, and are separated one from another by extremely beautiful valleys and ravines.

Owing to the bad condition of the roads and the mountainous nature of the country, we were more than ten hours in making the nineteen miles between Severnaya and Ulbinsk, although we had eight horses on the first stretch and five on the second. The slowness of our progress gave us an opportunity to walk now and then, and to make collections of flowers, and we kept the tarantas decorated all day with golden-rod, wild hollyhocks, long blue spikes of monk's-hood, and leafy branches of "zhimolost," or Tartar honeysuckle, filled with showy scarlet or yellow berries.

Late Saturday afternoon, as the sun was sinking behind the western hills, we rode at a brisk trot down the long, beautiful ravine which leads into the valley of the Ulba, and before dark we were sitting comfortably in the neat waiting-room of the Ulbinsk post station, refreshing ourselves with bread and milk and raspberries.

Among the political exiles living in Ulbinsk at that time were Alexander L. Blok, a young law student from the city of Saratof on the Volga; Apollo Karelin, the son of a well-known photographer in Nizhni Novgorod; Severin Gross, a law student from the province of Kovno; and Dr. Viter, a surgeon from Warsaw. Mr. Karelin had been accompanied to Siberia by his wife, but the others were, I believe, unmarried. I had learned the names, and something of the histories, of these exiles from the politicals in Semipalatinsk, and there were several reasons why I particularly wished to see them and to make their acquaintance. I had an idea that perhaps the politicals in Semipalatinsk were above the average level of administrative exiles in intelligence and education,—that they were unusually favorable specimens of their class,—and it seemed to me not improbable that in the wilder and re-

moter parts of western Siberia I should find types that would correspond more nearly to the conception of "nihilists" that I had formed in America.

Before we had been in the village an hour, two of the exiles — Messrs. Blok and Gross — called upon us and introduced themselves. Mr. Blok won my heart from the very first. He was a man twenty-six or twenty-eight years of age, of medium height and athletic figure, with dark hair and eyes, and a beard-

regular features. He talked in an eager, animated way, with an affectionate, caressing modulation of the voice, and had a habit of unconsciously opening his eyes a little more widely than usual as an expression of interest or emotion. Both of the young men were university graduates; both spoke French and German, and Mr. Blok read English; both were particularly interested in questions of political economy, and either of them might have been taken for a young professor, or a

THE VALLEY OF ULBINSK.

less but strong and resolute face, which seemed to me to express intelligence, earnestness, and power in every line. It was, in the very best sense of the word, a *good* face, and I could no more help liking and trusting it than I could help breathing. Marcus Aurelius somewhere says, with coarse vigor of expression, that "a man who is honest and good ought to be exactly like a man who smells strong, so that the bystander, as soon as he comes near, must smell, whether he choose or not." Mr. Blok's honesty and goodness seemed to me to be precisely of this kind, and I found myself regarding him with friendly sympathy, and almost with affection, long before I could assign any reason for so doing. Mr. Gross was a rather handsome man, perhaps thirty years of age, with brown hair, full beard and mustache, blue eyes, and clearly cut,

post-graduate student, in the Johns Hopkins University. I had not talked with them an hour before I became satisfied that in intelligence and culture they were fully abreast of the Semipalatinsk exiles, and that I should have to look for the wild, fanatical "nihilists" of my imagination in some part of Siberia more remote than Ulbinsk.

We talked in the post station until about 9 o'clock, and then, at Mr. Blok's suggestion, made a round of calls upon the other political exiles in the village. They were all living in wretchedly furnished log-houses rented from the Ulbinsk Cossacks, and were surrounded by unmistakable evidences of hardship, privation, and straitened circumstances; but they seemed to be trying to make the best of their situation, and I cannot remember to have heard anywhere that night a bitter complaint

or a single reference to personal experience that seemed to be made for the purpose of exciting our sympathy. If they suffered, they bore their suffering with dignity and self-control. All of them seemed to be physically well except Mrs. Karelin, who looked thin, pale, and careworn, and Dr. Vitert, who had been three times in exile and ten years in prison or in Siberia, and who, I thought, would not live much longer to trouble the Government that

senger." In the house of Mr. Blok there was a small but well-selected library, in which I noticed, in addition to Russian books, a copy of Longfellow's *Poems*, in English; Maine's "*Ancient Law*" and "*Village Communities*"; Bain's "*Logic*"; Mill's "*Political Economy*"; Lecky's "*History of Rationalism*" (an expurgated Russian edition); Spencer's "*Essays: Moral, Political, and Æsthetic*," and his "*Principles of Sociology*"; Taine's "*History*

THE TOWN OF UST KAMENOGORSK.

had wrecked his life. Although only forty-five years of age, he seemed greatly broken, walked feebly with a cane, and suffered constantly from rheumatism contracted in damp prison-cells. He was one of the best-informed exiles that I met in western Siberia, and was the first to tell me of the death of General Grant. We had a long talk about the United States, in the course of which he asked many questions concerning our civil war, the constitutional amendments adopted after the war, the balance of parties in Congress, and the civil-service reform policy of President Cleveland, which showed that he had more than a superficial acquaintance with our political history. In the houses of all the exiles in Ulbinsk, no matter how wretchedly they might be furnished, I found a writing-desk or table, books, and such magazines as the "*Revue des Deux Mondes*" and the "*Russki Vestnik*," or "*Russian Mes-*

of English Literature"; Laboulaye's "*History of the United States*"; and a large number of French and German works on jurisprudence and political economy. I need hardly call attention, I think, to the fact that men who read and carry to Siberia with them such books as these are not wild fanatics, nor "ignorant shoemakers and mechanics," as they were once contemptuously described to me by a Russian officer, but are serious, cultivated, thinking men. If such men are in exile in a lonely Siberian village on the frontier of Mongolia, instead of being at home in the service of the state — so much the worse for the state!

We spent the greater part of one night and a day with the political exiles in Ulbinsk. I became very deeply interested in them, and should have liked to stay there and talk with them for a week; but our excursion to the

Katunski Alps had occupied more time than we had allotted to it, and it was important that we should, if possible, reach the convict mines of eastern Siberia before the coming on of winter. Sunday afternoon at 4 o'clock we set out for Ust Kamenogorsk. Messrs. Blok and Karelin accompanied us on horseback as far as the ferry across the Ulba, and then, after bidding us a hearty and almost affectionate good-bye, and asking us not to forget them when we should return to "a freer and happier country," they remounted their horses and sat motionless in their saddles, watching us while we were being ferried over the river. When we were ready to start on the other side, a quarter of a mile distant, they waved their handkerchiefs, and then, taking off their hats, bowed low towards us in mute farewell as we dashed away into the forest. If these pages should ever be read in one of the lonely cabins of the political exiles in Ulbinsk, the readers may feel assured that "in a freer and happier country" we have not forgotten them, but think of them often, with the sincerest esteem and the most affectionate sympathy.

We reached Ust Kamenogorsk before dark Sunday afternoon and took up our quarters in the post station. The town, which contains about 5000 inhabitants, is a collection of 600 or 800 houses, generally built of logs, and is situated in the midst of a treeless plain on the right bank of the Irtysh, just where the latter is joined by its tributary the Ulba. It contains one or two Tartar mosques, two or three Russian churches with colored domes of tin, and an ostrog, or fortress, consisting of a high quadrangular earthen wall or embankment, surrounded by a dry moat, and inclosing a white-walled prison, a church, and a few Government buildings. The mosques, the white-turbaned mullas, the hooded Kirghis horsemen in the streets, the morning and evening cry of the muezzins, and the files of Bactrian camels, which now and then come pacing slowly and solemnly in from the steppe, give to the town the same Oriental appearance that is so noticeable in Semipalatinsk, and which suggests the idea that one is in northern Africa or in central Asia, rather than in Siberia.

While we were drinking tea in the post station we were surprised by the appearance of Mr. Gross, who had come from Ulbinsk that morning, and had been

KIRGHIS CAMEL TEAMS.

impatiently awaiting our arrival. He had hardly taken his seat when the wife of the station master announced that a Russian officer had come to call on us, and before I had time to ask Mr. Gross whether his relations with the Russian authorities were pleasant or unpleasant, the officer, dressed in full uniform, had entered the room. I was embarrassed for an instant by the awkwardness of the situation. I knew nothing of the officer except his name, and it was possible, of course, that upon finding a political exile there he might behave towards the latter in so offensive a manner as to make some decisive action on my part inevitable. I could not permit a gentleman who had called upon us to be offensively treated at our table, even if he was officially regarded as a "criminal" and a "nihilist." Fortunately my apprehensions proved to be groundless. Mr. Shaitanof, the Cossack officer who had come to see us, was a gentleman, as well as a man of tact and good breeding, and whatever he may have thought of the presence of a political exile in our quarters so soon after our arrival, he manifested neither surprise nor annoyance. He bowed courteously when I introduced Mr. Gross to him, and in five minutes they

were engaged in an animated discussion of bee-keeping, silk-worm culture, and tobacco growing. Mr. Shaitanof said that he had been making some experiments near Ust Kamenogorsk with mulberry trees and Virginian and Cuban tobacco and had been so successful that he hoped to introduce silk-worm culture there the next year, and to substitute for the coarse native tobacco some of the finer sorts from the West Indies and the United States.

After half an hour of pleasant conversation

Kamenogorsk there was at one end of the social scale a peasant shoemaker and at the other a Caucasian princess, while between these extremes were physicians, chemists, authors, publicists, university students, and landed proprietors. Most of them were of noble birth or belonged to the privileged classes, and some of them were men and women of high cultivation and refinement. Among those with whom I became best acquainted were Mr. Konovalof, who read English well but

A LAKE IN THE ALTAI.

Mr. Shaitanof bade us good-night, and Mr. Gross, Mr. Frost, and I went to call on the political exiles. In anticipation of our coming, ten or fifteen of them had assembled in one of the large upper rooms of a two-story log-building near the center of the town, which served as a residence for one of them and a place of rendezvous for the others. It is, of course, impracticable, as well as unnecessary, to describe and characterize all of the political exiles in the Siberian towns and villages through which we passed. The most that I aim to do is to give the reader a general idea of their appearance and behavior, and of the impression that they made upon me. The exiles in Ust Kamenogorsk did not differ essentially from those in Ulbinsk, except that, taken as a body, they furnished a greater variety of types and represented a larger number of social classes. In Ulbinsk there were only professional men and students. In Ust

spoke it imperfectly; * Mr. Milinchuk, a dark-haired, dark-bearded Georgian from Tiflis; and Mr. Adam Bialoveski, a writer and publicist from the province of Pultava. The last-named gentleman impressed me as a man of singular ability, fairness, and breadth of view. He was thoroughly acquainted with Russian history and jurisprudence, as well as with the history and literature of the west European nations; and although he was disposed to take rather a pessimistic view of life, and avowed himself a disciple of Schopenhauer, he bore the heavy burden of his exile with cheerfulness and courage. I had a long talk with him about the Russian situation, and was very favorably impressed by his cool, dispassionate review of the revolutionary movement and the measures taken by the Government for its suppression. His statements were entirely free from exag-

* Mr. Konovalof committed suicide in Ust Kamenogorsk about six months after we left there.

geration and prejudice, and his opinions seemed to me to be almost judicially fair and impartial. To brand such a man as a "nihilist" was absurd, and to exile him to Siberia as a dangerous member of society was simply preposterous. In any other civilized country on the face of the globe except Russia he would be regarded as the most moderate of liberals.

The colony of political exiles in Ust Kamenogorsk was the last one that we saw in the steppe provinces, and it seems to me desirable, before proceeding with the narrative of our Siberian journey, to set forth, as fully as space will permit, the salient features of what is known in Russia as "exile by administrative process."

Exile by administrative process means the banishment of an obnoxious person from one part of the empire to another without the observance of any of the legal formalities that, in most civilized countries, precede or attend deprivation of rights and the infliction of punishment. The person so banished may not be guilty of any crime, and may not have rendered himself amenable in any way to any law of the state; but if, in the opinion of the local authorities, his presence in a particular place is "prejudicial to social order," he may be arrested without a warrant, and, with the concurrence of the Minister of the Interior, may be removed forcibly to any other place within the limits of the empire, and there be put under police surveillance for a period of five years. He may, or may not, be informed of the reasons for this summary proceeding, but in either case he is perfectly helpless. He cannot examine the witnesses upon whose testimony his presence is declared to be "prejudicial to social order." He cannot summon friends to prove his loyalty and good character without great risk of bringing upon them the same calamity which has befallen him. He has no right to demand a trial, or even a hearing. He cannot sue out a writ of habeas corpus. He cannot appeal to the public through the press. His communications with the world are so suddenly severed that sometimes even his own relatives do not know what has happened to him. He is literally and absolutely without any means whatever of self-protection.

As an illustration of the sort of evidence upon which the presence of certain persons in the cities and provinces of European Russia is declared to be "prejudicial to social order," I will give two typical cases from the great number in my notebooks. Some of the readers of *THE CENTURY* may still remember a young naval officer named Stanukovitch, who was attached to the staff of the Grand Duke Alexis at the time of the latter's visit to the United States. From the fact that I saw in Mr.

Stanukovitch's house in Tomsk a number of visiting cards of people well known in the cities of New York and San Francisco, I infer that he went a good deal into society here, and that he may still be recalled to mind by persons who met him. He was the son of a Russian admiral, was an officer of great promise, and had before him the prospect of a brilliant career in the Russian naval service. He was, however, a man of broad and liberal views, with a natural taste for literary pursuits, and after his return from America he resigned his position in the navy and became an author. He wrote a number of novels and plays which were very successful, but of which the Government did not approve, and in 1882 or 1883 he purchased a well-known Russian magazine in St. Petersburg called the "*Diello*," and became its editor and proprietor. He spent a considerable part of the summer of 1884 abroad, and in the latter part of that year left his wife and children at Baden-Baden and started for St. Petersburg. At the Russian frontier station of Virzhbolof he was suddenly arrested, was taken thence to St. Petersburg under guard, and was there thrown into the fortress of Petropavlovsk. His wife, knowing nothing of this misfortune, continued to write to him at St. Petersburg without getting any answers to her letters, until finally she became alarmed, and telegraphed to the editorial department of the "*Diello*," asking what had happened to her husband and why he did not write to her. The managing editor of the magazine replied that Mr. Stanukovitch was not there, and that they had supposed him to be still in Baden-Baden. Upon the receipt of this telegram, Mrs. Stanukovitch, thoroughly frightened, proceeded at once with her children to St. Petersburg. Nothing whatever could be learned there with regard to her husband's whereabouts. He had not been seen at the editorial rooms of the "*Diello*," and none of his friends had heard anything of or from him in two weeks. He had suddenly and mysteriously disappeared. At last, after days of torturing anxiety, Mrs. Stanukovitch was advised to make inquiries of General Orzhefski, the Chief of Gendarmes. She did so, and found that her husband was a prisoner in one of the casemates of the Petropavlovsk fortress. The police, as it afterward appeared, had for some time been intercepting and reading his letters, and had ascertained that he was in correspondence with a well-known Russian revolutionist who was then living in Switzerland. The correspondence was perfectly innocent in its character, and related solely to the business of the magazine; but the fact that an editor, and a man of known liberal views, was in communication with a political refugee was

regarded as sufficient evidence that his presence in St. Petersburg would be "prejudicial to social order," and his arrest followed. In May, 1885, he was exiled for three years by administrative process to the city of Tomsk, in western Siberia. The publication of the magazine was of course suspended in consequence of the imprisonment and ultimate banishment of its owner, and Mr. Staniukovitch was financially ruined. If the Russian Government deals in this arbitrary way with men of rank, wealth, and high social position in the capital of the empire, it can be imagined what treatment is accorded to physicians, students, and small landed proprietors whose presence is regarded as "prejudicial to social order" in the provinces.

In the year 1879 there was living in the town of Ivangorod, in the province of Chernigof, a skillful and accomplished young surgeon named Dr. Baillie. Although he was a man of liberal views, he was not an agitator nor a revolutionist, and had taken no active part in political affairs. Some time in the late winter or early spring of 1879 there came to him, with letters of introduction, two young women who had been studying in one of the medical schools for women in St. Petersburg, and had been expelled and ordered to return to their homes in central Russia on account of their alleged political "untrustworthiness" (*neblagonadezhnost*). They were very anxious to complete their education and to fit themselves for useful work among the peasants; and they begged Dr. Baillie to aid them in their studies, to hear their recitations, and to allow them to make use of his library and the facilities of his office. As they were both in an "illegal" position,—that is, were living in a place where, without permission from the authorities, they had no right to be,—it was Dr. Baillie's duty as a loyal subject to hand them over to the police, regardless of the fact that they had come to him with letters of introduction and a petition for help. He happened, however, to be a man of courage, independence, and generous instincts; and instead of betraying them, he listened with sympathy to their story, promised them his aid, introduced them to his wife, and began to give them lessons. The year 1879 was a year of intense revolutionary activity in Russia. Attempts were constantly being made by the terrorists to assassinate high Government officials; and the police, in all parts of the empire, were more than usually suspicious and alert. The visits of the young girls to Dr. Baillie's house and office soon attracted the attention of the local authorities in Ivangorod, and they took steps to ascertain who they were and where they had come from. An investigation showed

that one of them was living on a forged passport, while the other had none, and that both had been expelled from St. Petersburg for political "untrustworthiness." Their unauthorized appearance in Ivangorod, when they should have been at their homes, and their half-secret visits—generally at night—to the house of Dr. Baillie, were regarded as evidence of a political conspiracy, and on the 10th of May, 1879, both they and the young surgeon were arrested and exiled by administrative process to Siberia. Dr. Baillie eventually was sent to the arctic village of Verkhoyansk, latitude 67.30, in the province of Yakutsk, where he was seen in 1882 by Engineer Melville, Lieutenant Danenhower, Mr. W. H. Gilder, and all the survivors of the arctic exploring steamer *Jeannette*. At the time of Dr. Baillie's banishment, his wife, a beautiful young woman, 24 or 25 years of age, was expecting confinement, and was therefore unable to go to Siberia with him. As soon as possible, however, after the birth of her child, and before she had fully recovered her strength, she left her nursing baby with relatives and started on a journey of more than 6000 miles to join her husband in a village situated north of the Arctic Circle and near the Asiatic pole of cold. She had not the necessary means to make such a journey by rail, steamer, and post, as Lieutenant Scheutze made it in 1885-86, and was therefore forced to ask permission of the Minister of the Interior to travel with a party of exiles.* As far as the city of Tomsk in western Siberia, both political and common criminal exiles are transported in convict trains or barges. Beyond that point the common criminals walk, and the politicals are carried in telegas, at the rate of about sixty miles a week, stopping in an *étape* every third day for rest. At this rate of progress Mrs. Baillie would have reached her husband's place of exile only after sixteen months of incessant hardship, privation, and suffering. But she did not reach it. For many weeks her hope, courage, and love sustained her, and enabled her to endure without complaint the jolting, the suffocating dust, the scorching heat, and the cold autumnal rains on the road, and the bad food, the plank sleeping-benches, the vermin, and the pestilential air of the *étapes*; but human endurance has its limits. Three or four months of this unrelieved misery, with constant anxiety about her husband and for the babe that, for her husband's sake, she had abandoned in Russia, broke down her health and her spirit. She sank into deep despondency

* By Russian law a wife may go to her exiled husband at the expense of the Government, provided she travels with an exile party, lives on the exile ration, sleeps in the road-side *étapes*, and submits generally to prison discipline.

VERA FIGNER.*

and eventually began to show signs of mental aberration. After passing Krasnoyarsk her condition became such that any sudden shock was likely completely to overthrow her reason—and the shock soon came. There are two villages in eastern Siberia whose names are almost alike—Verkholsensk and Verkhoyansk. The former is situated on the river Lena, only 180 miles from Irkutsk, while the latter is on the head-waters of the Yana, and is distant from Irkutsk nearly 2700 miles. As the party with which she was traveling approached the capital of eastern Siberia, her hope, strength, and courage seemed to revive. Her husband she thought was only a few hundred miles

away, and in a few more weeks she would be in his arms. She talked of him constantly, counted the verst-posts which measured her slow progress towards him, and literally lived upon the expectation of speedy reunion with him. A few stations west of Irkutsk she accidentally became aware, for the first time, that her husband was not in Verkholsensk, but in Verkhoyansk; that she was still separated from him by nearly 3000 miles of mountain, steppe, and forest; and that in order to reach his place of banishment that year she would have to travel many weeks alone, on dog or reindeer sledges, in terrible cold, through the arctic solitudes of north-eastern Asia. The sudden shock of this discovery was almost immediately fatal. She became violently insane, and died insane a few months later in the Irkutsk prison hospital, without ever seeing again the husband for whose sake she had endured such mental and physical agonies.

I have been compelled to restrict myself to the barest outline of this terrible tragedy; but if the reader could hear the story, as I heard it, from the lips of exiles who traveled with Mrs. Baillie, who saw the flickering spark of her reason go out, and who helped afterward to take care of her, he would not wonder that "exile by administrative process" makes "terrorists," but rather that it does not make a nation of "terrorists."†

It would be easy to fill pages of THE CENTURY with a statement of the cases of Russians who in the last ten years have been exiled to Siberia by administrative process, not only without reasonable cause, but without even the shadow of a cause. The well-known Russian novelist Vladimir Korolenko, one of whose books has recently been translated into English and published in Boston, was exiled to eastern Siberia in 1879, as the result of what the Government itself finally admitted to be an official mistake. Through the influence of powerful friends, he succeeded in getting this mistake corrected before he reached his destination, and was permitted to

* Vera Figner was one of the ablest and most daring of the Russian revolutionists and organized in Odessa in 1882 the plot which resulted in the assassination of General Strelmkoff. She was arrested, tried, and condemned to death, but her sentence was afterward commuted to imprisonment for life in the Castle of Schlussemburg. She is believed to have died there in 1885.

† My authorities for the facts of this case are: first, a well-known member of a Russian provincial assembly, a man of the highest character, who was personally cognizant of the circumstances attending Dr. Baillie's arrest and banishment; secondly, exiles who went to Siberia in the same party with Dr. Baillie; and, thirdly, exiles—one of them a lady—who were in the same party with Dr. Baillie's wife.

SOPHIA NIKITINA.

return from Tomsk. Irritated by this injustice, and by many months of prison and *étape* life, he refused to take the oath of allegiance to Alexander III. upon the accession of the latter to the throne, and for this obstinacy was exiled to the province of Yakutsk.*

Mr. Borodin, a well-known writer for the Russian magazine "*Annals of the Fatherland*," was banished to the province of Yakutsk on account of the "dangerous" and "pernicious" character of a manuscript found in his house by the police during a search. This manuscript was a copy of an article upon the economic condition of the province of Viatka, which Mr. Borodin had sent to the above-named magazine, but which up to that

time had not been published. Mr. Borodin went to eastern Siberia in a convict's gray overcoat with a yellow ace of diamonds on his back, and three or four months after his arrival in Yakutsk he had the pleasure of reading in the "*Annals of the Fatherland*" the very same article for which he had been exiled. The Minister of the Interior had sent him to Siberia merely for having in his possession a "dangerous" and "pernicious" manuscript, and then the St. Petersburg Committee of Censorship had certified that another copy of that same manuscript was perfectly harmless, and had allowed it to be published, without the change of a line, in one of the most popular and widely circulated magazines in the empire.†

A gentleman named Otchkin, in Moscow, was exiled to Siberia by administrative process in 1885 merely because, to adopt the language of the order which was issued for his arrest, he was "suspected of an intention to put himself into an illegal position." The high crime which Mr. Otchkin was "suspected of an intention" to commit was the taking of a fictitious name in place of his own. Upon what ground he was "suspected of an intention" to do this terrible thing he never knew.

Another exile of my acquaintance, Mr. Y——, was banished merely because he was a friend of Mr. Z——, who was awaiting trial on the charge of political conspiracy. When Mr. Z——'s

case came to a judicial investigation he was found to be innocent and was acquitted; but in the mean time, Mr. Y——, merely for being a friend of this innocent man, had gone to Siberia by administrative process.

In another case a young student, called Vladimir Sidorski (I use a fictitious name), was arrested by mistake instead of another and a different Sidorski named Victor, whose presence in Moscow was regarded by somebody as "prejudicial to social order." Vladimir protested that he was not Victor, that he did not know Victor, and that his arrest in the place of Victor was the result of a stupid blunder; but his protestations were of no avail. The police were too much occupied in un-

* A statement of the circumstances of Mr. Korolenko's first banishment to Siberia was published in the Russian newspaper "*Zemstvo*" for 1881, No. 10, p. 19.

† "*Zemstvo*," 1881, No. 10, p. 19. It is not often, of course, that facts of this kind, which are so damaging to the Government, get into the Russian news-

paper press. The account of Mr. Borodin's experience and of the exile of Mr. Korolenko was published at the time when the liberal ministry of Loris Melikoff was in power, just at the close of the reign of the late Tsar, and when the strictness of the censorship was greatly relaxed.

earthing "conspiracies" and looking after "untrustworthy" people to devote any time to a troublesome verification of an insignificant student's identity. There must have been something wrong about him, they argued, or he would not have been arrested, and the safest thing to do with him was to send him to Siberia, whoever he might be — and to Siberia he was sent. When the convoy officer called the roll of the out-going exile party, Vladimir Sidorski failed to answer to Victor Sidorski's name, and the officer, with a curse, cried, "Victor Sidorski! Why don't you answer to your name?"

"It is not my name," replied Vladimir, "and I won't answer to it. It's another Sidorski who ought to be going to Siberia."

"What is your name then?"

Vladimir told him. The officer coolly erased the name "Victor" in the roll of the party, inserted the name "Vladimir," and remarked cynically, "It does n't make a — bit of difference!"

In 1874 a young student named Egor Lazaref was arrested in one of the south-eastern provinces of European Russia upon the charge of carrying on a secret revolutionary propaganda. He was taken to St. Petersburg and kept in solitary confinement in the House of Preliminary Detention and in the fortress for about four years. He was then tried with "the 193" and acquitted.* One would suppose that to be arrested without cause, to be held four years in solitary confinement, to be finally declared innocent, and then to have no means whatever of redress, would make a revolutionist, if not a terrorist, out of the most peaceable citizen; but Mr. Lazaref, as soon as he had been released, quietly completed his education in the University, studied law, and began the practice of his profession in the city of Saratof on the Volga. He had no more trouble with the Government until the summer of 1884, when a police officer suddenly appeared to him one morning and said that the governor of the province would like to see him. Mr. Lazaref, who was on pleasant personal terms with the governor, went at once to the latter's "konsilaria," or office, where he was coolly informed that he was to be exiled by administrative process to eastern Siberia for three years. Mr. Lazaref stood aghast.

"May I ask your high excellency for what reason?" he finally inquired.

"I do not know," replied the governor. "I have received orders to that effect from the Ministry of the Interior, and that is all I know about it."

* Indictment in the case of the 193, and sentence in the same case. The original documents are in my possession.

Through the influence of friends in St. Petersburg, Mr. Lazaref obtained a respite of two weeks in which to settle up his affairs, and he was then sent as a prisoner to Moscow. He reached that city after the last party of political exiles had been dispatched for the season, and had to live in the Moscow forwarding prison until the next spring. While there he wrote a respectful letter to the Department of Imperial Police, asking, as a favor, that he might be informed for what reason he was to be exiled to eastern Siberia. The reply that he received was comprised in two lines, and was as follows: "You are to be put under police surveillance in eastern Siberia because you have not abandoned your previous criminal activity." In other words, he was to

PRINCE KRAPOTKINE.

be banished to the Trans-Baikal because he had not "abandoned" the "previous criminal activity" of which a court of justice had found him not guilty! In the Moscow forwarding prison, soon after Mr. Lazaref's arrival, a number of the political prisoners were comparing experiences one day and asking one another for what offenses they had been condemned to banishment. One said that forbidden books had been found in his house; another said that he had been accused of carrying on a revolutionary propaganda; and a third admitted that he had been a member of a secret society. Finally Mr. Lazaref's turn came, and upon being asked why he was on his way to Siberia, he replied simply, "I don't know."

"Don't know!" exclaimed one of his com-

GREGORIE MACHTET.

HELENE MACHTET.

rades. "Did n't your father have a black and white cow?"

"Very likely," said Mr. Lazaref. "He had a lot of cows."

"Well!" rejoined his comrade triumphantly, "what more would you have? That's enough to exile twenty men — and yet he says he does n't know!"

On the 10th of May, 1885, Mr. Lazaref left Moscow with an exile party for Siberia, and on the 10th of October, 1885, after twenty-two weeks of travel "by étape," reached the town of Chita, in the Trans-Baikal, where I had the pleasure of making his acquaintance.

The grotesque injustice, the heedless cruelty, and the preposterous "mistakes" and "misunderstandings" that make the history of administrative exile in Russia seem to an American like the recital of a wild nightmare are due to the complete absence, in the Russian form of government, of checks upon the executive power, and the almost equally complete absence of official responsibility for unjust or illegal action. The Minister of the Interior, in dealing with politicals, is not restrained to any great extent by law; and as it is utterly impossible for him personally to examine all of the immense number of political cases that come to him for final decision, he is virtually forced

to delegate a part of his irresponsible power to chiefs of police, chiefs of gendarmes, governors of provinces, and subordinates in his own ministry. They in turn are compelled, for similar reasons, to intrust a part of their authority and discretion to officers of still lower grade; and the latter, who often are stupid, ignorant, or unscrupulous men, are the persons who really make the investigations, the searches, and the examinations upon which the life or liberty of an accused citizen may depend. Theoretically, the Minister of the Interior, aided by a council composed of three of his own subordinates and two officers from the Ministry of Justice, reviews and reexamines the cases of all political offenders who are dealt with by administrative process;* but practically he does nothing of the kind, and it is impossible that he should do anything of the kind, for the very simple reason that he has not the time. According to the Russian newspaper "Strana," in the year 1881 there came before the Department of Imperial Police 1500 political cases.† A very large

* Vide "Rules concerning Measures to be taken for the Preservation of Civil Order and Public Peace," approved by the Tsar, August 14, 1881. Chapter V., section 34.

† Quoted in newspaper "Sibir" for Jan. 31, 1882, p. 5.

proportion of these cases were dealt with by administrative process, and if the Minister of the Interior had given to each one of them a half, or one-quarter, of the study which was absolutely essential to a clear comprehension of it, he would have had no time to attend to anything else. As a matter of fact he did not give the cases such study, but, as a rule, simply signed the papers that came up to him from below. Of course he would not have signed the order for the exile of Mr. Korolenko to the province of Yakutsk if he had known that the whole charge against the young novelist was based on a mistake; nor would he have signed the order for the exile of Mr. Borodin if he had been aware that the magazine article for which the author was banished had been approved by the St. Petersburg Committee of Censorship. He accepted the statements passed up to him by a long line of subordinate officials, and signed his name merely as a formality and as a matter of course. How easy it is in Russia to get a high official's signature to any sort of a document may be illustrated by an anecdote that I have every reason to believe is absolutely true. A "stola-nachalnik," or head of a bureau, in the provincial administration of Tobolsk, while boasting one day about his power to shape and direct governmental action, made a wager with another chinovnik that he could get the governor of the province — the late Governor Lissogorski — to sign a manuscript copy of the Lord's Prayer. He wrote the prayer out in the form of an official document on a sheet of stamped paper, numbered it, attached the proper seal to it, and handed it to the governor with a pile of other papers which required signature. He won his wager. The governor duly signed the Lord's Prayer, and it was probably as harmless an official document as ever came out of his office.

How much of this sort of careless and reckless signing there was in the cases of political offenders dealt with by administrative process may be inferred from the fact that, when the liberal minister Loris Melikoff came into power in 1880, he found it necessary to appoint a revisory commission, under the presidency of General Cherevin, to investigate the cases of persons who had been exiled and put under police supervision by administrative process, and to correct, so far as possible, the "mistakes," "misunderstandings," and "irregularities" against which the sufferers in all parts of the empire began to protest as soon as the appointment of a new Minister of the Interior gave them some reason to hope that their complaints would be heeded. There were said to be at that time 2800 political offenders in Siberia and in various remote parts of Eu-

ropean Russia who had been exiled and put under police surveillance by administrative process. Up to the 23d of January, 1881, General Cherevin's commission had examined the cases of 650 such persons, and had recommended that 328, or more than half of them, be immediately released and returned to their homes.*

Of course the only remedy for such a state of things as this is to take the investigation of political offenses out of the hands of an irresponsible police, put it into the courts, where it belongs, and allow the accused to be defended there by counsel of their own selection. This remedy, however, the Government persistently refuses to adopt. The Moscow Assembly of Nobles, at the suggestion of Mr. U. F. Samarin, one of its members, sent a respectful but urgent memorial to the Crown, recommending that every political exile who had been dealt with by administrative process should be given the right to demand a judicial investigation of his case. The memorial went unheeded, and the Government, I believe, did not even make a reply to it.†

Before the year 1882 the rights, privileges, and obligations of political offenders exiled to Siberia by administrative process were set forth only in secret circular-letters, sent from time to time by the Minister of the Interior to the governors of the different Siberian provinces. Owing to changes in the ministry, changes in circumstances, and changes of ministerial policy, these circular-letters of instruction ultimately became so contradictory, or so inconsistent one with another, and led to so many "misunderstandings," "irregularities," and collisions between the exiles and the local authorities in the Siberian towns and villages, that on the 12th of March, 1882, the Minister of the Interior drew up, and the Tsar approved, a set of rules for the better regulation of police surveillance and exile by administrative process. An official copy of this paper, which I brought back with me from Siberia, lies before me as I write. It is entitled, "Rules concerning Police Surveillance." ("Polozhenie o Politseskom Nadzore.") The first thing that strikes the reader in a perusal of this document is the fact that it declares exile and police surveillance to be, not *punishments* for crimes already committed, but measures of precaution to prevent the commission of crimes that evil-minded men may contemplate. The first section reads as follows: "Police surveillance [which includes administrative ex-

* An official announcement by the Government, quoted in the newspaper "Sibir" for Jan. 31, 1881, p. 1.

† Newspaper "Zemstvo," 1881, No. 10, p. 21.

ile] is a means of preventing crimes against the existing imperial order [the present form of government]; and it is applicable to all persons who are prejudicial to the public peace." The power to decide when a man is "prejudicial to the public peace," and when exile and surveillance shall be resorted to as a means of "preventing crime," is vested in the governors-general, the governors, and the police; and in the exercise of that power they pay quite as much attention to the opinions that a man holds as to the acts that he commits. They can hardly do otherwise. If they should wait in all cases for the commission of criminal acts, they would not be "*preventing crime*," but merely watching and waiting for it, while the object of administrative exile is to *prevent* crime by anticipation. Clearly, then, the only thing to be done is to nip crime in the bud by putting under restraint, or sending to Siberia, every man whose political opinions are such as to raise a presumption that he *will* commit a crime "against the existing imperial order" if he sees a favorable opportunity for so doing. Administrative exile, therefore, is directed against ideas and opinions from which criminal acts may come, rather than against the criminal acts themselves. It is designed to anticipate and prevent the acts by suppressing or discouraging the opinions; and, such being the case, the document which lies before me should be called, not "Rules concerning Police Surveillance," but "Rules for the Better Regulation of Private Opinion." In the spirit of this latter title the "Rules" are interpreted by most of the Russian police.

The pretense that administrative exile is not a punishment, but only a precaution, is a mere juggle with words. The Government says, "We do not exile a man and put him under police surveillance as a punishment for holding certain opinions, but only as a means of preventing him from giving such opinions outward expression in criminal acts." If the banishment of a man to the province of Yakutsk for five years is not a "punishment," then the word "punishment" must have in Russian jurisprudence a very peculiar and restricted signification. In the case of women and young girls a sentence of banishment to eastern Siberia is almost equivalent to a sentence of death, on account of the terrible hardships of the journey and the disease-saturated condition of the *étapes* — and yet the Government says that exile by administrative process is not a punishment!

In 1884 a pretty and intelligent young girl named Sophia Nikitina, who was attending school in Kiev, was banished by administrative process to one of the remote provinces of

eastern Siberia. In the winter of 1884-85, when she had accomplished about 3000 miles of her terrible journey, on the road between Tomsk and Atchinsk she was taken sick with typhus fever, contracted in one of the pestilential *étapes*. Physicians are not sent with exile parties in Siberia, and politicals who happen to be taken sick on the road are carried forward, regardless of their condition and regardless of the weather, until the party comes to a lazaret, or prison hospital. There are only four such lazarets between Tomsk and Irkutsk, a distance of about a thousand miles, and consequently sick prisoners are sometimes carried in sleighs or telegas, at a snail's pace, for a week or two — if they do not die — before they finally obtain rest, a bed, and a physician. How many days of cold and misery Miss Nikitina endured on the road that winter after she was taken sick, and before she reached Atchinsk and received medical treatment, I do not know; but in the Atchinsk lazaret her brief life ended. It must have been a satisfaction to her, as she lay dying in a foul prison hospital, 3000 miles from her home, to think that she was not undergoing "punishment" for anything that she had done, but was merely being subjected to necessary restraint by a parental Government, in order that she might not sometime be tempted to do something that would have a tendency to raise a presumption that her presence in Kiev was about to become more or less "prejudicial to social order."

Helene Machtet (born Medvedieva), whose portrait will be found on page 732, and whose reading of Turgenev's "Virgin Soil" to her "pipe club" in a St. Petersburg prison I have referred to in a previous article, died in Moscow in 1886 soon after her return from a long term of exile in western Siberia. Her husband, Gregorie Machtet, one of the most talented of the younger novelists of Russia, was arrested on the very threshold of a brilliant literary career and exiled to Siberia by administrative process. His portrait may recall him to the minds of some of the readers of THE CENTURY in Kansas, where he lived for a time during a visit that he made to the United States.

Prince Alexander Krapotkine, a most accomplished gentleman and fine mathematician and astronomer, was exiled to Siberia by administrative process, mainly because he was the brother of Prince Pierre Krapotkine, the well-known Russian revolutionist, who now resides in London. Alexander Krapotkine lived ten years in banishment, and then committed suicide at Tomsk in 1886.

Victoria Gukofskaya, a school-girl only fourteen years of age, was banished from

Odessa to eastern Siberia in 1878, and hanged herself at Krasnoyarsk in 1881.

An administrative exile named Bochinn went insane at the village of Amga, in the province of Yakutsk, in 1883, and after killing his wife, who also was an administrative exile, and his child, which had been born in exile, he took poison.

In the face of all these terrible tragedies, and of many more to which I cannot now even refer, the Russian Government pretends that exile by administrative process is not a "punishment," but merely a wise precaution intended to restrain people from wrong-doing.

I have not space in this article for a tenth part of the evidence which I collected in Siberia to show that administrative exile is not only cruelly unjust, but, in hundreds of cases, is a punishment of barbarous severity. If it attained the objects that it is supposed to attain, there might, from the point of view of a despotic Government, be some excuse if not justification for it; but it does not attain such objects. Regarded even from the side of expediency, it is uselessly and needlessly cruel. In a recent official report to the Minister of the Interior, Major-General Nicolai Baranof, the governor of the province of Archangel, in discussing the subject of administrative exile says:

From the experience of previous years, and from my own personal observation, I have come to the conclusion that administrative exile for political reasons is much more likely to spoil the character of a man than to reform it. The transition from a life of comfort to a life of poverty, from a social life to a life in which there is no society whatever, and from a life of activity to a life of compulsory inaction, produces such ruinous consequences, that, not infrequently, especially of late, we find the political exiles going insane, attempting to commit suicide, and even committing suicide. All this is the direct result of the abnormal conditions under which exile compels an intellectually cultivated person to live. There has not yet been a single case where a man, suspected with good reason of

political untrustworthiness and exiled by administrative process, has returned from such banishment reconciled to the Government, convinced of his error, and changed into a useful member of society and a faithful servant of the Throne. On the other hand, it often happens that a man who has been exiled in consequence of a misunderstanding, or an administrative mistake, becomes politically untrustworthy for the first time in the place to which he has been banished — partly by reason of his association there with real enemies of the Government, and partly as a result of personal exasperation. Furthermore, if a man is infected with anti-Government ideas, all the circumstances of exile tend only to increase the infection, to sharpen his faculties, and to change him from a theoretical to a practical — that is, an extremely dangerous — man. If, on the contrary, a man has not been guilty of taking part in a revolutionary movement, exile, by force of the same circumstances, develops in his mind the idea of revolution, or, in other words, produces a result directly opposite to that which it was intended to produce. No matter how exile by administrative process may be regulated and restricted, it will always suggest to the mind of the exiled person the idea of uncontrolled official license, and this alone is sufficient to prevent any reformation whatever.*

Truer words than these were never written by a high Russian official, and so far as the practical expediency of exile by administrative process is concerned, I should be content to rest the case against it wholly upon this frank report of the governor of Archangel. The subject, however, may be regarded from a point of view other than that of expediency — namely, from the point of view of morals, justice, and humanity. That side of the question I shall reserve for further discussion in future. In this paper I have tried to show how recklessly, carelessly, and unjustly Russian citizens are banished to Siberia by administrative process. In subsequent articles I shall describe, as fairly, fully, and accurately as I can, the conditions of the life which political exiles in Siberia are compelled to live.

* "Juridical Messenger" (the journalistic organ of the Moscow Juridical Society, or Bar Association), October, 1883, p. 332.

George Kennan.

OLD AGE'S LAMBENT PEAKS.

THE touch of flame — the illuminating fire — the loftiest look at last,
O'er city, passion, sea — o'er prairie, mountain, wood — the earth itself;
The airy, different, changing hues of all, in falling twilight,
Objects and groups, bearings, faces, reminiscences;
The calmer sight — the golden setting, clear and broad:
So much 't the atmosphere, the points of view, the situations whence we scan,
Bro't out by them alone — so much (perhaps the best) unreck'd before;
The lights indeed from them — old age's lambent peaks.

Walt Whitman.

A MEXICAN CAMPAIGN.

BY THOMAS A. JANVIER, AUTHOR OF THE IVORY BLACK STORIES.

IN THREE PARTS. PART II.

THE AFFAIR OF MOLINO DEL REV.

R. PEMBERTON LOGAN SMITH returned from Guanajuato five or six days later, bringing his sheaves with him. But his sheaves did not amount to much.

He arrived from the railway station in time to join the party at dinner; and although dining was about at an end, they all waited while he ate his dinner and at the same time gave an account of himself.

"What a blessing it is again to get something to eat," he observed with much satisfaction as Gilberto—"the best waiter I ever came across anywhere," Mr. Gamboge had declared approvingly—took away his empty soup-plate and filled his glass from a bottle of Father Gatillon's sound claret. "I staid at Doña Maria's, of course, and the old lady did her best for me, I know—but even her best did n't amount to much; and I've been getting hungrier and hungrier every day."

"And how about the picture?" Brown asked. "You must have made pretty quick work of it to get anything done in this time."

"Oh, the picture! Yes, I'd forgotten about that. You see, when I saw the Bufa again I concluded that it was too much for me. It wants a bigger man, you know—somebody like Orpiment. You really ought to go up and paint it, Orpiment; it's a wonderful thing." This pleased Verona, of course. She highly approved of anything in the shape of an acknowledgment of her husband's superiority.

"That's all very well," said Orpiment; "but if you have n't been painting the Bufa, what have you been doing? And what's gone with all your virtuous resolutions?"

"Well, you see, we did n't half do up Guanajuato—it's a wonderful place; I think it's the most picturesque place I ever saw. I've been investigating it. I found some more pictures, for one thing. There's a tremendously good 'Cena de San Francisco,' that we never saw at all, in the sacristy of that little church just across the street from Doña Maria's. And I went out to the Valenciana mine, and there is one of the most beautiful

churrigueresque church interiors out there that I ever laid eyes on, and we missed that, too, you know. There was lots to do without painting. I could have put in another week easily."

"Did you see anything of the Espinosas?" Violet asked with a fine air of innocent curiosity.

"The Espinosas! Oh, yes, I saw them. In fact I—as it happened, I saw a good deal of them," Pem answered in some slight confusion. "Yes, they were very civil to me," he continued. "You see I had to present the letter that you sent, Mrs. Mauve; and when they found that I had missed so much that is worth seeing in Guanajuato they took me in hand in the kindest way and showed me everything. It was ever so nice of them. And—and we happened to come down together on the same train. You see, I found it was quite hopeless to try to paint the Bufa, and as they were coming down I thought I'd come down too. What a nice old lady Señora Espinosa is, and Don Antonio is delightful. I've rarely met such pleasant people."

"And how about the pretty girl?" Brown struck in, although Rose tried to stop him by pinching him.

"It's never any good to pinch me, Rose," Brown explained, when his conduct subsequently was criticised. "Half the time I don't know what I'm pinched for and it only makes me get my back up; and the other half you don't get in your pinch until I've said what you don't want me to say. If I were you, I'd stop it."

"But, Van, indeed it was very unkind in you to speak that way to-night. Don't you see that Mr. Smith is quite seriously interested in this sweet young girl; and just suppose you were to make him so uncomfortable that he should break it all off before it's fairly begun. Don't do anything like that again, I beg of you."

"For so young a woman, Rose, your match-making proclivities are quite remarkable. How do you know that this Mexican girl is 'sweet'? Remember your gambling friend at Aguas Calientes, Rosey, and don't be precipitate, my dear" (this was an unfair allusion on Brown's part, and he had to apologize for it). "After all, though, you must admit that Smith did n't

seem to be very badly knocked out by my shot at him."

This was quite true, for Pem had expected some such question, and, being ready for it, he answered with a very fair degree of composure: "You mean the Señora Carillo. She is charming, of course. I don't believe that you know, Mrs. Mauve," he added, turning to Violet, "that your friend is a widow?"

"Oh, how perfectly delightful!" cried Violet. Then, seeing that Rose, Verona, and Mrs. Gamboge all looked shocked, she added, "Of course I don't mean that it is delightful to have people's husbands die, or anything like that, you know. But after they *are* dead, in this part of the world at least, it's delightful to be a widow. A Mexican young girl might just as well be a — a humming-top, for all the good she has of anything, you see. But as soon as she's a widow she can go anywhere and do anything she pleases and have nobody bothering at her at all. It's better than being a young girl in the States, ever so much. And so Carmen's a widow. Just think of it! And I did n't even know that she had been married. She's got ever so far ahead of me, has n't she, Rowney? And I thought that I was ahead of her. It's too bad! But who did she marry, Mr. Smith? And when did he die? Do tell me all about it, please."

And Pem explained that the Señorita Espinosa had been married about a year after the time that she had left school, and that her husband had died suddenly within two or three months of their marriage. "I don't believe it was quite a heart-breaking affair," Pem added. "Her cousin, Rodolfo, you know, told me that old Don Ignacio was a grouty old fellow, and that the marriage had been made up mainly because his hacienda adjoined her father's, and there was some row about the water-rights which had been going on for years and which they succeeded this way in compromising. Rodolfo was very indignant about the whole business, and I'm sure I don't wonder. Do they do much of that sort of thing down here, Mrs. Mauve? It's like a bit out of the dark ages."

"But think how happy she is now, Mr. Smith," said the practical Violet; "and think what a good thing it is to have the matter about the water settled so nicely. You don't know how important it is to get a thing like that settled. I remember papa and another man had a bad shooting match about a water-right once; and papa would have been killed, everybody said, if he had n't been too quick for the other man and got the drop on him. And it cost papa ever so much to square things after he'd killed the other man; for the judges knew that papa was rich

and they made him pay like anything. I'm very glad for Carmen's sake that she was able to do her father such a good turn; and she must be glad too — especially now that it's all well over and she is a comfortable widow. And you say that they all came down with you to-night?"

"Yes, and they sent word that they are coming in a body to call on all of us to-morrow — that's the Mexican way, I believe. And they have a plan on foot for a picnic, or something of that sort, for us at Señor Espinosa's place out at Tacubaya —"

"Oh, in that lovely garden! I used to go out there with Carmen sometimes on Sundays while I was at the convent. It's perfectly delightful!"

"Yes, I fancy from what they said about it that it must be rather a nice place. And after the lunch, or breakfast, or whatever they call it, we're to walk across and see the view of the valley from a place that they say is very nice — it's upon a hillside above the Molino del Rey; just where the battle was fought in 1847, Don Antonio said. Really, Mrs. Mauve, we all owe a great deal to you for putting us in the way of seeing Mexican life from the inside."

This view of the indebtedness of the American party to its Spanish-American member became general two days later, when they all were conveyed to Tacubaya by Don Antonio in a special tram-car, and were given a breakfast in his beautiful *huerta* that quite astonished them. That Pem approved of the food, Philadelphian though he was, did not, under the circumstances, count for much; but the hearty indorsement of Mexican cooking on the part of Mr. Gamboge and Mr. Mangan Brown, neither of whom regarded such matters lightly, and whose judgment was not biased by any sudden yielding to the tender emotions, counted for a good deal. It was while they were returning to the city that Mr. Gamboge, after a long, thoughtful silence, thus spoke:

"Brown, I shall remember that dish of *mole* — I have learned the name of it carefully, you see — until my dying day."

And Mr. Mangan Brown briefly but feelingly replied, "And so shall I."

As for Rose, she declared that she must be asleep and had dreamed herself into a Watteau landscape; for such a garden as this was, as she lucidly explained, she believed could have no existence outside of a picture that was inside of a dream.

Mrs. Gamboge, whose tendency was towards the sentimental, wished Mr. Gamboge to come and sit beside her on the grass, beneath a tree near the little brook. And her feel-

ings were rather hurt because Mr. Gamboge declined to fall in with her romantic fancy, on the ground that sitting on the grass certainly would give them both the rheumatism. And he did n't mend matters by adding that he would have been very glad to please her had they only thought to bring along a gum-blanket.

But quite the happiest member of this exceptionally happy party was Mr. Pemberton Logan Smith; for this young man, while he was not as yet exactly in love, had made a very fair start into the illusions and entanglements of that tender passion. During the four or five days at Guanajuato his intercourse with the Señora Carillo had been hampered by the formalities attending new acquaintanceship, and especially by the rule of Mexican etiquette that throws the entertainment of a guest upon the oldest lady of the household. His eyes had been very steadily in the service of the pretty widow; but his ears, and so much of his tongue as the circumstances of the case required,—which was not much, for Doña Catalina was a great talker,—necessarily were employed in the service of her aunt.

But on the present occasion Doña Catalina naturally devoted herself more especially to Mrs. Gamboge and the two elderly gentlemen,—Violet, rather against her will, serving as interpreter,—and this left Pem free to follow his own inclinations. It was the first fair chance that he had had, and he made the most of it. A further fortunate fact in his favor was that he was the only man of the American party—except Jaune d'Antimoine, who was busily employed as interpreter between his wife, Rose, Verona, and the Mexican young gentlemen—who possessed a colloquial command of Spanish. How Pem did bless his lucky stars now that, being overtaken by a mood of unwonted energy, he had had the resolution to grind away so steadily under that stuffy old professor during his winter in Granada!

So, without much difficulty, he contrived to keep close to the widow all day,—much to his own enjoyment, and, apparently, not to her distaste. She was not like any of the women whom he had known in Spain—where, to be sure, his opportunities for any save most formal acquaintance had been very limited; and she certainly was unlike her own countryfolk. Even in her lightest talk there was an air about her of preoccupation, of reserve, that was in too marked contrast with Doña Catalina's very cheerful frankness to be accounted for merely on the ground of the difference between youth and age; and that, so far as his observation had gone, was not by any means characteristic of Mexican women either old or young. And from the obscurity

of this reserve she had a way, he found, of flashing out rather brilliantly turned expressions of decidedly original thought. When she accompanied these utterances, as she sometimes did, with a little curl of her finely cut red lips, and with a quick glance from her dark-brown eyes,—not tender eyes, yet eyes which somehow suggested possibilities of tenderness,—he found that her sayings, if not increased in point, certainly gained in effectiveness. Altogether, Mr. Smith was disposed to regard the Señora Carillo as a decidedly interesting subject for attentive study.

Naturally, since they had been so much together during the day, Pem was the widow's escort when they all set out, in late afternoon, to walk to the point of view that Don Antonio, as he expressed it, would have the honor to bring to their notice. It was a desperately dusty walk, and the American ladies—who had donned raiment of price for the occasion—contemplated the defilement of their gowns in anything but a contented spirit. They beheld with wonder the calmness with which their Mexican sisters—who were equally well dressed, though in the style that would obtain in New York during the ensuing season—made no effort whatever to preserve their garments from contamination.

"That gros-grain of Mrs. Espinosa's will be absolutely ruined, Rose," Mrs. Gamboge declared, speaking in the suppressed voice that most people seem to consider necessary when airing their private sentiments in the presence of other people who do not understand a word of the language in which the private sentiments are expressed. "Mine is bad enough, though I'm doing everything I can think of to save it. Do just drop behind me a little and see if I'm making a very shocking exhibition of my ankles. I'm afraid that I am, but I really can't help it. These Mexican ladies seem to think no more of getting dusty than if they all were dressed in calico. I can't understand it at all."

The Señora Carillo certainly paid no attention whatever to the increasing dustiness of her gown. Her early venture in matrimony had not been of an encouraging sort, and since she had come into her estate of widowhood her tendency—as Violet in her free but expressive south-western vernacular probably would have stated the case—was to "stand off" mankind generally. It was a surprise to herself when she discovered that so far from finding this good-looking young *Americano* repulsive, she positively was attracted by him. For one thing, he struck her as differing in many ways from her own countrymen; and she had an instinctive feeling that the unlikeness was not merely superficial. She was sure

that his scheme of life was a larger, broader scheme than that which she had known, and there was a genuineness in his deference to her as a woman that contrasted both forcibly and favorably with certain of her past experiences.

In point of fact this Mexican young woman had begun life by being a little out of harmony with her environment. She did not know very clearly what she wanted, but she knew that it was something quite different from that which she had. It was this feeling that had led her to select Violet Carmine for a close friend. She was not at all in sympathy with Violet's most radical tendencies; but she found in Violet a person, the only person, who was not shocked when she stated some of her own small convictions as to what a woman's life might be. Even to this friend she had not told that it was her hope, should she ever marry, to be the companion of her husband—not merely his handmaiden, in the scriptural sense. And she was glad now that she had been thus reticent, for her hope by no means had been realized.

After that very disillusioning venture into the holy estate of matrimony, this poor *Cármen* found herself entirely at odds with herself and with the world. Had she lived a generation earlier she would have become a nun. It was a subject of sincere sorrow to her that nunneries had been abolished in Mexico by the Laws of the Reform.

It was only natural that there should be a certain feeling of pleasure mixed with her feeling of astonishment at her present discovery of a man for whom she had at once both liking and respect. It was agreeable, she thought, to find that there really was such a man in the world. But beyond this very general view of the situation her thoughts did not go. It made very little difference to her, one way or the other, this discovery. The man was a foreigner, and an American at that,—and *Cármen* had a good strong race hatred for the Americans of the North,—come into her country only for a little while. Presently he would go home again; and that, so far as she was concerned, would be the end of him. In the mean time she would please herself by studying this new specimen of male humanity. It was well to hold converse with a foreigner, she thought; it enlarged one's mind.

So, lagging a little behind the rest of the party, and chatting in a manner somewhat light to be productive of any very marked mental improvement, they walked westward through the straggling streets of Tacubaya—past low houses with great barred windows, past high-walled gardens, the loveliness of which was only hinted at by overhanging trees

and climbing vines, and by the glimpse in passing to be had through the iron gates—over to and out upon the hillside above the *Molino del Rey*. They stopped beside the little pyramidal monument that commemorates the battle. The rest of the party had gone on a few rods farther; for Don Antonio, with true Mexican courtesy, had acted upon his instinctive conviction that beside this monument was not a place where a party of right-thinking Americans would care to halt.

Below them, embowered in trees, was the old Mill of the King that Worth's forces carried that September day forty years ago; beyond rose the wooded, castle-crowned height of Chapultepec; still farther away were the towers and glistening domes of the city and the great shimmering lakes, and for background rose the blue-gray mountains above Guadalupe in the north. To the east, over across Lake Chalco, towered the great snow peaks of the volcanoes.

"Upon my soul, I wish I had been born a Mexican," said Pem, drawing a long breath.

"Because the Mexicans happen to be possessors of a fine landscape? That is not a good reason. There are better things for a people to have than landscapes, Señor; and some of these better things, if I am rightly told, your people have."

"Well, I must say I don't know what they are. Just now I can't think of anything finer than this view—except the happy fact that you have done me the honor to lead me to it, *Señorita*."

"I could wish that you would not speak in that fanciful manner. It is in the custom of my own country, and I do not like it. I have been told that the Americans do not make fine speeches, and I shall be glad to know that it is so."

Pem was rather taken aback by this frank statement of very un-Mexican sentiment.

"The *Señorita*, then, does not approve of the customs of her own people, and is pleased to like the Americans? For the compliment to my countrymen I give to the *Señorita* my thanks."

"I do not like your countrymen. I hate them."

"And why?"

"Is not this an answer?" *Cármen* replied, laying her hand upon the battle monument.

Pem felt himself to be in an awkward corner, for the position that his Mexican friend had taken—while not, perhaps, in the very best of taste—was quite unassailable. As he rather stupidly stared at the ugly little monument, thus pointedly brought to his notice, he felt that it did indeed represent an act of unjust aggression that very well might make

Mexicans hate Americans for a thousand years.

"As to the customs of my countrymen," *Cármen* continued, perceiving that the particular American before her was very much embarrassed, and politely wishing to extricate him from the trying position that, not very politely, she had placed him in, "some of them are very well. But this of making fine speeches to women is not well at all. Do the men have this foolish custom in your land, or is it only that while in Mexico you wish to do what is done here?"

It was a relief to have the subject changed in any way, but the new topic was one not altogether free from difficulties. Mr. Smith never before had been called upon to defend the utterance of a small gallantry upon ethical and ethnological grounds; still less to treat the matter from the standpoint of comparative nationalities.

"Well, I think that I have heard of civil speeches being made now and then by American men to American women," he replied. "Yes, I believe that I am justified in telling you positively that speeches of this sort among us may be said to be quite everyday affairs. May I ask why the *Señorita* objects to them? They strike me as being harmless, to say the least."

"They are idle and silly. It is the same talk that one would give to a cat. I do not know why a woman should be talked to as though she had nothing of sense. It is true, she cannot know as much as a man; but she may ask to have it believed that she knows more than a cat, and still not claim to be very wise. And so, if the *Señor* will permit the request, I will beg that he will keep his handsome speeches for those who like them and that he will say none to me at all.

"See, our friends are coming towards us, and we will go back to the town. And the *Señor* will pardon me if I have been rude. I should not have said what I did about Americans. I find now that they are not all bad." There was more in the look that accompanied this utterance than there was in the words. "I have not had a very happy life, and sometimes, they tell me, I forget to be considerate of others and am unkind. But I have not meant to be unkind to-day."

The last portion of *Cármen's* speech was hurried, for the party was close upon them, and they all were together again before *Pem* could reply.

Nor did he have another chance to continue this, as he had found it, notwithstanding the awkward turns that it had taken, very interesting conversation. *Cármen* stuck close to her aunt, and was almost silent, as they walked

back to the garden; and she contrived, as they returned by the tramway to the city, to seat herself quite away from him in the car.

Since she so obviously had no desire to speak further, *Pem* felt that he would be pleasing her best by engaging the estimable *Doña Catalina* in lively talk. This was not a difficult feat, for *Doña Catalina* was a miracle of good-natured loquacity, who, in default of anything better to wag her tongue at, no doubt would have talked with much animation to her shoes. In view of the fact that he scarcely had been able to get in a word edge-wise, he was rather tickled when this admirable woman, at parting, commended him warmly for having so well mastered the Spanish tongue. *Pem* ventured, at this juncture, to cast a very slightly quizzical look at *Cármen*, and was both surprised and delighted by finding that his look was returned in kind.

"A Mexican woman who does n't like pretty speeches, and who has such a charming way of qualifying her hatred of Americans, and who can see the point of a rather delicate joke," thought *Pem*, "would be worth investigating though she were sixty years old and as ugly as the National Palace. And *Cármen*"—this was the first time, by the way, that he had thought of her as *Cármen*—"I take it is not quite twenty yet; and what perfectly lovely eyes she has!"

At dinner that night Mr. Smith was unusually silent. When rallied by the lively *Violet* upon his taciturnity he replied that he was rather tired.

THE BATTLE OF CHURUBUSCO.

WHEN the American party played the return match, as *Rowney Mauve*, who had cricketing proclivities, expressed it, by giving their Mexican friends a breakfast in the pretty *San Cosme Tivoli*, *Cármen* did not appear. She had a headache that day, her aunt explained, and begged to be excused.

Rose commented upon this phase of the breakfast with her usual perspicuity. "I think that it all is working along very nicely, Van, don't you?" They had strolled off together and were out of ear-shot of the rest of the party.

"What is working along nicely? The breakfast? Yes, it seems to be all right. The food was very fair, and our friends seemed to enjoy themselves after their customary rather demonstrative fashion."

"It is a great trial to me, Van, the way you never catch my meaning. I don't mean the breakfast at all; I mean about Mr. Smith and this lovely widow. Is n't it queer to think that she is a widow? Except that she has a

serious way about her — that has come to her through her sorrow, of course, poor dear! — nobody ever would dream that she was anything but a young girl. What a romance her life has been!"

"Well, I can't say that I see much romance about it. First she was traded off by her father for a hydrant, or something of that sort; and then she had an old husband — a most objectionable old beast he must have been from what we have heard about him — die on her hands before she was much more than married to him. I should say that the whole business was much less like a romance than like a nightmare. And as to this new match that you have made up for her working along nicely, it strikes me that just now it is working along about as badly as it can work. Did n't you see how Smith went off into the dumps the moment that he found his widow had stayed at home? And don't you think that her staying at home this way is the best possible proof that she does n't care a button for him? Smith saw it quick enough, and that was what made him drop right down into dumpiness. So would I, if I'd been him, and a girl had gone back on me that way. You used to come and take walks with me, Rosey, — in the old days when we were spooning in Greenwich, — when your head was aching fit to split, you precious child." They were in an out-of-the-way part of the garden, and on the strength of this memory Brown put his arm around his wife and kissed her. After which interlude he added: "So can't you see that all your match-making is moonshine? It's a case of 'he loved the lady, but the lady loved not him,' and you might as well accept the situation and stop your castle-building."

"You are a very dear boy, Van, and of course I'd go walking with you even without any head at all. But about love-matters you certainly are very short-sighted. You can't help it, I suppose, because you're a man; and men never understand these things at all. But any woman could tell you at a glance that this love affair between Mr. Smith and the dear little Mexican widow is going on splendidly. Even you can see that Mr. Smith is in love with her. Well, I don't think that she's exactly in love with him yet; but I am quite certain that she feels that if she does n't take care she will be. That's the reason she has a headache and did n't come to-day."

"What a comfort it would be to Smith to know that!" Brown remarked with fine irony. "You had better tell him, my dear."

"Yes, of course it would be," Rose answered, entirely missing the irony. "And I've been thinking that I would tell him, Van;

only I thought that perhaps you would n't like me to. I'm very glad you won't mind — for of course he does n't see, men are so stupid about such things. Suppose we go and hunt him up now, and then you go away and leave us together, and I'll tell him how much encouragement she is giving him."

"Suppose you tell me first. I'll be shot if I see much that's encouraging in her shying off from him this way."

"Why, I have told you, Van. It's because she is afraid that if she sees any more of him she really will fall in love with him; and of course, after her dreadful experience with that horrid old man, she has made up her mind that she never will marry again. That is the way that any nice girl would feel about it. And of course, if she's so much interested in Mr. Smith that she won't trust herself to see him, it is perfectly clear that he has made a very good start towards getting her to love him. What we must do now is to help him —"

"Steady, Rose; don't go off your head, my child. This is n't our funeral."

"It *is* our funeral. Why, it's anybody's funeral who can help in a case of this sort. Think how much we owe to dear Verona for the way that she helped us. Certainly we must help him. And the first thing for us to do is to give him another good chance to have a talk with her. That's all they want at present. No doubt we can do some other things later; and we will, of course. Why, Van, how can you be so heartless as not to be ready to do everything in your power to help your friend when the whole happiness of his life is at stake! And think what a good thing it will be for this poor sweet, broken-hearted girl, whose life has gone all wrong, to make it go right again."

Mrs. Brown's strongest characteristic was not, perhaps, moderation. In the present instance, while her husband was not wholly convinced by her vigorous line of argument, he found her enthusiasm rather contagious.

"What are you going to do about it?" he asked, a little doubtfully.

"Why, I think we can manage just what has to be done now, getting them together again, you know, this way: You know Don Antonio has on hand an expedition for us to that beautiful old convent that he has been talking about, where there is such lovely tile-work, out at Churubusco. We had better arrange things now to go day after to-morrow. And to-morrow Mr. Smith shall send a note to Don Antonio telling him that he is very sorry to miss the expedition, but that he has decided to go up to see a friend in Toluca. He has been talking about that engineer up at Toluca whom he used to go to school

with, so Don Antonio will think it all right and perfectly natural. And that will fix things beautifully. For then she'll go, of course."

"I don't see how it will fix anything beautifully for him to go off to Toluca. He won't see his widow there."

"O you foolish boy! He won't stay there, of course. He must go, because if he did n't he would n't be telling the truth in his note to Don Antonio,"—Rose had a very nice regard for the truth,—“but instead of staying at least one night, as of course they will expect him to, he must come right back to Mexico by the afternoon train. And then he can tell Don Antonio, when we all meet at the car, as we did the other day, that he has returned on purpose to join his party; and that will please Don Antonio—and then it will be too late for her to back out. And if he needs any help to get her off to himself when we are out at the convent, he can depend upon me to see that he gets it! Is n't that a pretty good plan, Van? How delightful and exciting it all is! It's almost as though we were overcoming difficulties and obstacles and getting married again ourselves, is n't it, dear?"

"No, I don't think it is. I think it's mainly vigorous imagination let loose upon a very small amount of fact. But we'll play your little game, Rosey, just for the fun of the thing. Only there's one thing, child, that you must be careful about. You can't make your plan go without explaining it to Smith. Now don't you tell him all the nonsense you have been telling me about the way you think the widow feels towards him. I don't think it's so; and since he really seems to be rather hard hit, it is n't fair to set him up with a whole lot of hopes and then have things turn out the other way and knock him down again. Tell him that it is just barely possible that things are the way you think they are, and that your plan is in the nature of an experiment that probably will have no result at all, or will turn out altogether badly—as I certainly think it will. I don't believe that you can do him any good; but if you put the matter to him this way, at least you won't do him any harm."

And Rose, perceiving the justice of her husband's utterance, promised him that in her treatment of this delicate affair she would be very circumspect indeed.

THE first part of the plan thus skillfully elaborated worked to a charm. When the Americans joined Don Antonio and his party on the plaza, to take the special tram-car in waiting for them on the Tlalpam tracks, Rose gave Van a delighted nudge and whispered:

"See, she has come, just as I said she would. And oh! oh!"—Rose squeezed Van's arm in her excitement with what he considered quite unnecessary vigor—"she has just seen Mr. Smith, and she is, indeed she is, changing color! Don't you see it? Now you know that I was right all along."

Brown, being on the lookout for it, did perceive this sign of confusion on the part of the Señora Carillo; but it was so slight that no one else, Pem alone excepted, noticed it. Another good sign, as Rose interpreted it, was that while Don Antonio and the rest were running over with voluble expressions of their pleasure because the Señor Esmit—the first letter and the digraph in Pem's name was too much for them—had cut short his visit to his friend in Toluca in order to join them in their outing, Carmen maintained a discreet silence. Pem, not being gifted with Rose's powers of tortuous penetration, regarded this silence as ominous, until Rose, perceiving that he was going wrong, managed to whisper to him cheerfully, "It's all right. Quick, go and sit by her!"

But this friendly advice came too late to be acted upon. Carmen, possibly foreseeing Pem's intention, executed a rapid flank movement—that Rose thought made the case still more hopeful, and that Pem thought made it still more hopeless—by which she placed herself securely between her aunt and her cousin Rodolfo, and so decisively checked the enemy's advance.

Under these discouraging circumstances Pem fell back on his reserve—that is to say, on Rose; who made a place for him to sit beside her and, so far as this was possible without being too marked in her confidences, said what she could to cheer and comfort him.

And, indeed, this young gentleman's requirements in the way of cheering and comforting were very considerable. He had confided freely in Rose—Rose was a most refreshingly sympathetic confidante in a love affair—after she herself had broken the ice for him; and the very fact of talking to her about his heart-troubles had done a good deal to give them substance and directness. As the result of several conversations, Rose arrived at the conclusion that if Carmen had come to the breakfast at San Cosme, and had treated Pem in an every-day, matter-of-fact sort of way, the affair very likely would have been there and then ended. "But when I went to breakfast, and she was not there, Mrs. Brown," Pem explained, "I suddenly realized how dreadfully much I had counted upon seeing her, and what a hold she had upon me generally. And then, while I was wretchedly low in my mind about it all, you came to me like

an angel and told me that perhaps I had something to hope for. I should n't have hoped at all if it had n't been for you. I think that I might even have had sense enough just to let it all go, and started right back for the States. And that would have been the end of it. But now that you have encouraged me, I'm quite another man. I shall fight it out now till she absolutely throws me over, or till I marry her.

"In the matter of family, Mrs. Brown," Pem went on, his Philadelphia instincts asserting themselves, "the marriage is a very desirable one. Her people have been established in America even longer than mine. Her cousin tells me that they trace their ancestry directly to the Conqueror himself,—through the Cortés Tolosa line, you know,—and they are connected with some of the very best families of Mexico and Spain. So, you see, there is no reason why I should not make her my wife. If it can be done, I'm going to do it; and if it can't—well, if it can't, there won't be much left in my life that's worth living for, that's all."

When Rose reported this conversation to her husband he listened with an air of serious concern. "You've shoved yourself into a tolerably good-sized responsibility, Rosey," he said; "and I'm inclined to think, my child, that you're going to make a mess of it. I should advise you, if you are lucky enough to get out of this scrape with a whole skin, to take it as a sort of solemn warning that in future you will save yourself a good deal of trouble if you will let other people's love-making alone. But since you are so far in, my dear, I don't see how you can do anything but go ahead and try to bring Smith out all right on the other side."

Rose would not admit, of course, that she felt at all overpowered by the weight of her responsibility; but she did feel it, at least a little, and consequently hailed with a very lively satisfaction every act on Carmen's part that possibly could be construed as supporting the hopeful view of the situation that she so energetically avowed. She went into the fight with all the more vigor now that victory was necessary not only to the happiness of her ally, but to the vindication of her own reputation as the projector of heart-winning campaigns.

Rose was encouraged by the fact that the tactics of the enemy were distinctively defensive. She argued that this betrayed a consciousness, possibly only instinctive, but none the less real, of forces insufficient to risk a general engagement; and she further argued that the most effective plan of attack would be to cut off the main body of the enemy—

that is to say, Carmen herself—from her reserves,—that is to say, from the protection of her aunt and other relatives,—and then to force a decisive battle. Before the car reached San Mateo she had communicated this plan to Pem, and he had agreed to it.

But it is one thing to plan a campaign in the cabinet, and it is quite another thing to carry on the campaign in the field. The allies presently had this fact in military science pointedly brought home to them.

From where the car was stopped, near the little old parish church of San Mateo,—closed now and falling into ruin, for the near-by conventual church has been used in its stead,—the party walked a short half-mile along a lane bordered by magueys, and then came out upon a plazuela whereon the main gate of the convent opened. In the middle of the plazuela Pem saw, much to his disgust, another pyramidal battle monument, inscribed, like the one at Molino del Rey, with a brief eulogy of Mexican valor as shown in the gallant but futile resistance offered to the invading armies of the Americans of the North. It was very unlucky, he thought, that their expeditions should be directed so persistently to the old battle-fields of that wretched war. Since Carmen's pointed reference to the war he had bought a Mexican school history and had read up on it; and, even allowing for the natural bias of the historian, the more that he read about the part played by his own country the more was he ashamed of his own countrymen. Yet he could not but think also that it was rather hard that he should have to bear such a lot of responsibility for an event that occurred before he was born. It was n't fair in Carmen, he thought, to liven up a dead issue like that and make it so confoundedly personal.

A couple of Mexican soldiers, in rather draggled linen uniforms, were sitting sentry lazily at the convent gate; and Don Antonio explained that the convent proper was now a military hospital. The church, and the large close in front of it, remained devoted to religious purposes, he said; and that portion of the old convent which inclosed the inner quadrangle had been reserved as a dwelling-place for the parish priest.

Passing to the left and turning the angle in the wall, they came to an arched gateway approached by a short flight of stone steps; and through this stately entrance, albeit somewhat shorn of its stateliness by the ruinous condition of its great wooden doors, they entered, and descended another short flight of steps into the close.

"Where are your Italian convents now?" Brown asked, turning to Rowney Mauve, who

that morning had been talking rather airily about Italian convents. "You admitted as we came along how good this place was in mass—not scattered a bit, but all the lines well worked together—and how well the gray and brown of the walls, and the green of the trees, and the blue and white tiling of the dome, come together. Now we have some detail. Did you ever strike anything in Italy better than this great high-walled close, with its heavy shadows from these stunning trees and from the church and the convent, and its bits of color from these stations of the cross in colored tiles? The church might be better, but it has at least a certain heavy grandeur, and the little tower up there is capital. And look, how well those black arches close beside it bring out that perfectly beautiful little chapel—I suppose it is a chapel—completely covered with blue and yellow tiles! There are, no doubt, grander churches than this in Italy, and in several other places; but I'll be shot if I believe that there are any more perfectly picturesque or more entirely beautiful. Smith, just tell Don Antonio that I shall be grateful to him to the end of my days for having shown me this lovely place."

"He says that the cloister is finer," Pem translated, while Don Antonio's face beamed thanks upon the party at large; for all the Americans manifestly concurred in Brown's enthusiastic expression of opinion. "And he says that the finest tile-work is in the choir. I must say I don't remember anything in Spain better than this. It's the rich, subdued color of it all, and the light and shade, I suppose, that does the business. I don't think it would paint, though; do you, Orpiment?"

"No, I don't. You could make a pretty good picture of it; but the picture would n't go for much with anybody who had seen the original. You can't paint a place that goes all around you, the way that this does; and you can't paint the spirit and the feeling of it—at least I can't; and that's what you'd have to get here if you got anything at all. No, this is one of the places that we'd better let alone."

The decision, which was a wise one, having been arrived at, the party passed under the archway beside the tiled chapel and so entered the inner quadrangle, surrounded by an arched cloister two stories high, the walls wainscoted with blue and white tiles. In the open, sunny center was a little garden, and in the midst of the garden a curious old stone fountain in which purely transparent water bubbled up from a spring with such force as to make a jet three or four inches high above the center of the large pool. The bubbling water glittered in the sunlight, and little waves that seemed half water and half sunshine constantly went

out from the throbbing center of the pool and fell away lightly upon its inclosing quaintly carved walls of stone.

Here there was another outburst of admiration on the part of the Americans, and while they were in the midst of it the parish priest, attracted by the sound of so many voices in this usually silent and forgotten place, came forth from a low archway and stared about him wonderingly. He was a little round man, with a kindly, gentle face, and a simplicity of manner that told of a pure soul and a trustful heart. Mrs. Gamboge, who entertained tolerably strong convictions in regard to the Scarlet Woman, and who heretofore had held as a cardinal matter of faith that every Roman Catholic priest was a duly authorized agent of the Evil One, found some difficulty in reconciling with these sound Protestant views the look and manner, and such of the talk as was translated to her, of this simple-minded, single-hearted man.

When it was made clear to the little padre that this distinguished company, including even Americans from the infinitely remote city of New York, had come to look at his church because it was beautiful, his expression of mingled amazement and delight was a joy to behold. It had never occurred to him, he said, that anybody but himself should think of his poor church as beautiful. He had thought it so for a long while, ever since he had been brought to this parish from his former parish of Los Reyes, where the church was very small and very shabby, and, moreover, was tumbling down. But he had thought that his feeling for the beauty of his church was only because he loved it so well; for in all the years that he had been there no one ever had even hinted that it was anything more than churches usually are. Yet it had seemed to him, he said modestly, that there was something about the way the shadows fell in the morning in the close, and something at that time about the colors of the walls and the richer color of the tiles, the like of which he had not seen elsewhere. In the stillness and quiet, amidst these soft shadows and soft colors, somehow he found that his heart became so full that often, without at all meaning to pray, he would find his thoughts shaping themselves in prayer.

"Good for the padre," said Orpiment when Pem translated this to him. "That's the part of that picture that I said could n't be painted. He does n't look it a bit, but that little round man is an artist." But Orpiment was mistaken. Padre Romero loved beautiful things, not because he was an artist, but because he had a simple mind and a pure soul.

Under the padre's guidance the party entered the church—commonplace within, for

reformation had destroyed its seventeenth-century quaintness — and thence passed up through the convent to the choir. This beautiful place, rich in elaborate tile-work, remained intact; and even the great choir-books, wrought on parchment in colored inks, still rested on the faldstool, waiting for the brothers to cluster around them once again in song. And there were the benches whereon the brothers once had rested; the central chair, in which Father Saint Francis had sat in effigy; and to the right of this the chair of the father guardian. But the brothers had departed forever, legislated out of existence by the Laws of the Reform.

Rose gave a little shudder as she looked about her in this solemn, deserted place, and with her customary clearness of expression declared that it was "something like being in an empty tomb full of Egyptian mummies."

"And to think," said Mr. Mangan Brown, who was a martyr to sea-sickness, "that Americans constantly are crossing that beastly Atlantic Ocean in search of the picturesque when things like this are to be seen dry-shod almost at their doors. Let us have our breakfast at once."

There was a lack of consecutiveness about Mr. Brown's remark, but its abstract comment and concrete suggestion were equally well received. Even Rowney Mauve, who was disposed to be critical, admitted that there were "several things worth looking at in Mexico," and added, by way of practical comment upon Mr. Brown's practical proposal, that he was as hungry as a bear.

All this while Rose had been endeavoring to bring about the *tête-à-tête* between Pem and Carmen that she believed would tend to the accomplishment of their mutual happiness. But her efforts had been unsuccessful. Carmen's defensive tactics no longer admitted of doubt, and even Rose was beginning to think that her sanguine interpretation of their meaning might be open to question. Thus far she had tried to cut Carmen out from her supports. She determined now to attempt the more difficult task of drawing off these supports, and so leaving Carmen isolated.

The breakfast, a very lively meal eaten in the lower cloister to the accompaniment of the tinkling of water falling from the fountain, gave her the desired opportunity for organizing her forces. With the intelligent assistance of Violet, who was taken into partial confidence because her knowledge of Spanish made her a valuable auxiliary, Rose contrived to break up the party, when breakfast was ended, so that she, Doña Catalina, Carmen, and Pem remained together, while the others scattered to explore the convent. Then, Pem serving as

interpreter, she asked the ladies if it would be possible to walk in the tangled old garden that they had seen from a window in the sacristy.

Doña Catalina, being devoted to gardens, as Mexican women usually are, accepted the proposition immediately and heartily; and Carmen—a little uneasily, Rose thought—fell in with the plan. Fortunately the padre appeared at this moment, and was delighted to guide them through a long, dark corridor and so into his domain of trees and flowers. He was full of enthusiasm about the garden. It had been restored to the church only a month before, he said, after belonging to the hospital ever since the property had been confiscated. The soldiers had done nothing with it. The ladies could see for themselves its neglected state. They must come again in a year's time, and then they would see one of the finest gardens in the world. And full of delight, the little man explained with great volubility his plans for pruning and training, for clearing away weeds and rubbish, and for making his wilderness once more to blossom like the rose. Doña Catalina, having her own notions about gardens, entered with much animation into his plans, and they talked away at a great rate.

So Rose and Pem and Carmen walked through the shady alleys slowly, while Doña Catalina and the priest, walking still more slowly, and stopping here and there, that the projected improvements might be fully explained, dropped a long way behind.

It was a perfect Mexican day. Overhead was a clear, very dark-blue sky; liquid sunshine fell warmly through the cool, crisp air; a gentle wind idled along easily among the branches of the trees. The garden was very still. The only sound was a low buzzing of bees among the blossoms, and the faint gurgle of the flowing water in conduits unseen amidst the trees.

Rose stepped aside to pluck a spray of peach blossoms. Carmen half stopped, but Pem, with admirable presence of mind, walked slowly on without pausing in the rather commonplace remark that he happened to be making in regard to the advantages of irrigation. A few steps farther on they came to a half-ruined arbor. They turned here and looked back along the alley, but Rose was not in sight. "She will join us in a moment," said Pem. "She is looking for flowers—she is very fond of flowers. Shall we wait for her here? And will the Señorita seat herself in the shade?"

Carmen stood for a moment irresolute. As the result of what she believed to be a series of small accidents, she found herself now in precisely the situation that she had determined to avoid—alone with this Americano whom

she had decided in her own mind to keep at a safe distance. Yet now that the situation that she had tried hard to render impossible actually had been brought about she found in it a certain excitement in which pleasure was blended curiously with pain. Her position certainly was weakened, for Pem observed, and counted the sign a good one, that her color had increased and that her eyes were brighter even than usual. She herself was conscious that the attack now had passed inside of the skirmish line, and made an effort—not a very vigorous one—to rally her forces.

"Señorita! Señorita!" she called, but not very loudly, and her voice lacked firmness. There was no answer.

"She will be here in a moment," Pem repeated. "It is pleasant in this shady place. Will not the Señorita seat herself? And will she answer me one question?" Pem's own heart was getting up into his throat in an awkward sort of way, and his voice was not nearly so steady as he wished it to be. But the chance had come that he had been waiting for, and he was determined to make the most of it.

Cármen gave a hurried glance around her. Rose still remained invisible. It was very lonely there in the old garden, and the stillness seemed to be intensified by the low, soft buzzing of the bees. There was a tightness about her heart, and she felt a little faint. Her color had left her face, and she was quite pale. She seated herself with a little sigh. But she realized that another rally was necessary, for the shakiness of Pem's voice had an unmistakable meaning. She could guess pretty well, no matter what his one question might be, in what direction it ultimately would lead, and she felt that she must check him before it was spoken. Her wits, however, were not in very good working order, and she presented the first thought that came into her mind—the thought, indeed, that had been uppermost in her mind all that day:

"The Señor soon will leave Mexico?" she said. She was aware even as these words were spoken that they served her purpose badly. Pem perceived this too, and hastened to avail himself of the opening. "And the Señorita will be glad when I am gone?"

"Glad? No. But things must end, and the Señor no doubt now is tired of this land and will have pleasure in returning to his own. He will have many lively stories to tell his friends about the savages whom he has seen in Mexico; and then presently he will forget Mexico and the savages, and will be busied again with his own concerns. Is it not so?"

"Is it the custom of Mexicans thus to forget friends who have shown them great kindness; or does the Señorita argue by contraries and

declare that, because Mexicans are grateful, there is no such virtue as gratitude among Americans? Does the Señorita truly in her heart believe that I shall forget the kindness that has been shown to me here, and the—and those who have shown it?"

"Ah, well, it is a little matter, not worth talking about," Cármen replied, uneasily. "No doubt some Americans have feelings of gratitude, and other virtues as well. But, as the Señor knows, I am not fond of Americans. I know too well the story of my own country. Yes, I know that I should not have spoken of this again," Cármen went on, answering the pained look on Pem's face, "but it is not my fault. The Señor should not have made me talk about Americans." This with a little air of defiance. "And least of all in this place. The Señor knows that this very convent was captured by his countrymen from mine? But does he remember that after the surrender, when he was asked to give up his ammunition, the General Anaya replied, 'Had I any ammunition, you would not be here'? Is not that the whole story of the war, told in a single word? Does the Señor wonder that I hate the Americans with all my heart?"

Pem was less disconcerted by this sally than he had been by the similar revival of dead issues at Molino del Rey. He was fairly well convinced in his own mind that Cármen was saying not more than she meant in the abstract, perhaps; but, certainly, a good deal more than she meant in the concrete as applied to himself. It was his belief that she was forcing this new fighting of the old war as a rather desperate means of delivering herself from engaging in a new and more personal conflict. He also inferred from her adoption of a line of defense that he knew was distasteful to her that, like General Anaya, she was short of ammunition. Entertaining these convictions, he was disposed to press the attack vigorously.

"Let us not talk about Americans," he said. "Let us talk about one single American. Does the Señorita hate *me*?"

This sudden and very pointed question produced much the same effect as that of the unmasking of a heavy mortar battery. It threw the enemy into great confusion, and for a moment completely silenced the defending guns.

Cármen was not prepared for so sharp a shifting of the conversation from general to exceedingly personal grounds. She flushed again, and then again grew pale. She was silent for a very long while—at least so it seemed to Pem. Her head was reclining backward against the trellis-work of the arbor in a way that showed the beautiful lines of her throat. Her eyes were nearly closed, and almost wholly veiled

by her long black lashes—that seemed still blacker by contrast with her pale cheeks. Her mouth was open a little, and her breath came and went irregularly. Her face was very still; but as Pem waited for her answer, watching her closely, he saw an expression of resolve come into it. Then at last she spoke:

“I do hate you,” she said slowly and firmly. But as she spoke the words there was a drawing of the muscles of her face, as though she suffered bodily pain.

“Unearthed at last! By Jove, Smith, I had begun to think that you and the Señorita and Rose had fitted yourselves out with wings and flown away somewhere. I’ve been looking for you high and low, literally; for I’ve been up on the roof of the convent, and now I’m down here. Where is Rose? Doña Catalina said that you all three were here in the garden. Oh! there she comes now. Come! We’re all waiting for you; it’s time to start back to town.”

Brown was of the opinion that he did not at all deserve the rating that Rose gave him, on the first convenient opportunity, for perpetrating this most untoward interruption. “How the dickens could I know they were spooning by themselves?” he asked. “I thought that you all three were together, of course.” And although

Rose, who took the matter a good deal to heart, replied that this “was just like him,” she could not but accept this reasonable excuse.

On Pem and Cármen the effects of the interruption were different. Whatever her more considerate opinion might be, Cármen’s first feeling certainly was that of relief. She had fired the shot that she had nerved herself to fire, and the diversion had come just in time to check the reply of the enemy and to cover her orderly retreat.

Pem, realizing that the situation was critical, was thoroughly indignant. He wanted to punch Brown’s head. Fortunately no opportunity offered for this practical expression of his wrath, and by the time that he got back to town he had cooled down a little. But he was so grumpy on the return journey, and looked so thoroughly uncomfortable, that the motherly Doña Catalina expressed grave concern when she bade him good-bye and frankly asked him—with the freedom that is permissible in Spanish—if anything that he had eaten at breakfast had disagreed with him? And being only half-convinced by his disclaimer, she advised him to take promptly a tumblerful of hot water strengthened with a little tequila.

(To be concluded in the next number.)

Thomas A. Janvier.

POEMS BY JOHN VANCE CHENEY.

GREAT IS TO-DAY.

OUT on a world that’s gone to weed!
The great tall corn is still strong in his seed;
Plant her breast with laughter, put song in your toil,
The heart is still young in the mother-soil:
There’s sunshine and bird song, and red and white clover,
And love lives yet, world under and over.

The light’s white as ever, sow and believe;
Clearer dew did not glisten round Adam and Eve,
Never bluer heavens nor greener sod
Since the round world rolled from the hand of God:
There’s a sun to go down, to come up again,
There are new moons to fill when the old moons wane.

Is wisdom dead since Plato’s no more?
Who’ll that babe be, in yon cottage door?
While your Shakspeare, your Milton, takes his place in the tomb,
His brother is stirring in the good mother-womb:
There’s glancing of daisies and running of brooks,
Ay, life enough left to write in the books.

The world’s not all wisdom, nor poems nor flowers,
But each day has the same good twenty-four hours,
The same light, the same night. For your Jacobs, no tears;
They see the Rachels at the end of the years:
There’s waving of wheat, and the tall, strong corn,
And his heart-blood is water that sitteth forlorn.

A DAY-DREAM.

'T WAS not 'neath spectral moon,
But in the day's high noon,
That, pillowed on the grass,
I saw a vision pass.

Strange quiet folded round,
Strange silence — close, profound;
Sweet peace, peace sweet and deep,
Bade every trouble sleep.

"O spirit! stay with me,
Lying all quietly:
If this be death," I said,
"Thrice blessed be the dead."

The shape with others passed,
Each fainter than the last;
And — dreadful was the roar —
I heard the day once more.

OLD BRADDOCK.

FIRE! Fire in Allentown!
The Women's Building — it must go.
Mothers wild rush up and down,
Despairing men push to and fro;
Two stories caught — one story more —
See! leaps old Braddock to the fore —
Braddock, full three-score.

Like a high granite rock
His good gray head looms huge and bare;
Firm as rock in tempest shock
He towers above the tallest there.
"Conrad!" 'T is Braddock to his son,
The prop he thinks to lean upon
When his work is done.

Conrad, the young and brave,
Unflinching meets his father's eye:
"Who would now the children save,
That they die not, himself must die."
On his white face no touch of fear,
But, oh, it is so sweet, so dear —
Life at twenty year!

"Father — father!" A quick
Embrace, and he has set his feet
On the ladder. Rolling thick,
The flame-shot smoke chokes all the street,
Blinds so only one has descried
Her form that, through its dreadful tide,
Springs to Conrad's side.

Strong she is, now, as he,
Throbbing with Love's own lion might;
Strong as beautiful is she,
And Conrad's arms are pinioned tight.
"Far through the fire, sits God above" —
In vain he pleads; full does it prove,
Her full strength of love.

Too late she sets him free —
High overhead his father's call;
From a height no eye can see
Calls hoary Braddock down the wall,
"Old men are Death's, let him destroy;
Young men are Life's, Conrad, my boy —
Life's and Love's, my boy!"

Wilder the women's cries,
Hoarser the shouts of men below;
Sheets of fire against the skies
Set all the stricken town aglow.
With sweep and shriek, with rush and roar,
The flames shut round Old Braddock hoar —
Braddock, full three-score.

"Save, save my children, save!"
"Ay, ay!" all answer, speak as one,
"If man's arm can from the grave
Bring back your babes, it will be done;
Know Braddock still is worth us all.
Hark — hark! It is his own brave call, —
'Back — back from the wall!'"

God — God, that it should be!
As savagely the lashed wind veers,
Fiercer than the fiery sea
The frantic crowd waves hands, and cheers:
An old man high in whirl of hell!
The children, — how, no soul can tell, —
Braddock holds them well.

Shorn all that good gray head
With snows of sixty winters sown;
Griped around the children's bed,
One arm is shriveled to the bone:
"Old men are Death's, let him destroy;
Young men are Life's, Conrad, my boy —
Life's and Love's, my boy!"

Fire! Fire in Allentown!
Though 't was a hundred years ago,
How the babes were carried down
To-day the village children know.
They know of Braddock's good gray head,
They know the last, great words he said,
Know how he fell — dead.

COLLEGE FRATERNITIES.*

SIGMA DELTA CHI CLOISTERS AND CHAPEL, S. S., YALE.

Of college fraternities in the United States one significant fact may pass unquestioned—they have retained the affection and kept the support of a large number of those who knew them best. On their rosters are found not only the names of undergraduates, but also those of men who long since left youth and folly far behind. Indeed, one now and then runs across a name that adds a certain dignity to the catalogue and becomes an inspiration for ambitious youth. Of these many find no small satisfaction in identifying themselves from time to time with the life of the various clubs and societies of which they were members when boys at college; they take a mild, half-melancholy pleasure in reminiscent talk, and delight to meet and wander with half-regretful sadness in halls where youth wears the crown.

The charm of life in the society hall is much easier for one to imagine than for another to relate. A stereotyped phrase, "mere boyishness," fails to explain it; a compendium of dry facts and arguments would be farther still from picturing the life that often masquerades under the thin veil of a half-pretended secrecy.

More "sweetness and light" seems always to have been the goal towards which the fraternities strove, and the story of their development is a plain tale of natural and steady growth from small beginnings.

Towards the end of the first quarter of the present century the social life of our colleges had become barren—not more barren, perhaps, than it had been for many years, but relatively so in view of the fact that life was becoming richer and the spirit of the times more liberal. Boys from families in which puritanical methods were obsolete naturally hated the puritanism of college discipline; they chafed at the petty decorum of the stuffy class-rooms, and fretted at the deadness of the iron-bound curriculum. Almost the only means of relaxation countenanced by the faculties were open

KAPPA ALPHA LODGE, CORNELL.

debating societies, which met on the college grounds, and to the meetings of which both professor and student might go. In view of the fact that students, from the days of Horace down, were wont to hold their preceptors as their natural enemies, the presence of professors did not increase the popularity of these societies. Indeed, they languished. Here was the opportunity of the typical college fraternity.

Of these societies the first to assume the characteristics that are now recognized as their essential, albeit it soon lost them, had been Phi Beta Kappa. It was founded at Williamsburg, Virginia, December 5, 1776, in the very room where Patrick Henry had voiced the revolutionary spirit of Virginia. The story is a simple one: John Heath, Thomas Smith, Richard Booker, Armistead Smith, and John Jones,

students at William and Mary College, then the most wealthy, flourishing, and aristocratic institution of learning in America, believing that there was room for a more effective student organization than the one of a Latin name that then existed there, and recalling that one of their number was the best Greek scholar in college, resolved to found a new society, the proceedings of which were to be secret, to be known by the name of the three Greek letters that formed the initials of its motto — Phi Beta Kappa. The minutes are discouraging to those who would like to consider Phi Beta Kappa as a band of youthful enthusiasts planning a union of the virtuous college youth of this country, who were afterward to reform the world; and even more so to those who have declared infidel philosophy to be its cult. Youths of fine feelings and good digestion, they enjoyed together many a symposium like that on the occasion of Mr. Bowdoin's departure for Europe, when, "after many toasts suitable to the occasion, the evening was spent by the members in a manner which indicated the highest esteem for their departing friend, mixed with sorrow for his intended absence and joy for his future prospects in life." They called themselves a "fraternity." More thoroughly to enjoy the society of congenial associates, to promote refined good-fellowship, was the motive of these hearty young students who founded the first of the true Greek-letter fraternities, with (to quote from its ritual) "friendship as its basis, and

"KEYS" HALL, YALE.

benevolence and literature as its pillars"—one which thrived in their day as its successors on the same basis flourish in ours. So far from being inspirers, or a product, of American national spirit, or of a union of the wise and virtuous to which they invited all known American colleges, the only reference in their record to the Revolution is the single mention of the "confusion of the times" in the record of the final meeting; and the only recognition of the existence of other colleges is the record of the granting of charters for "meetings" at Harvard and Yale, which institutions were never mentioned again.

Meanwhile Cornwallis was coming nearer, and after having chartered additional chap-

"BONES" HALL, YALE.

ters,—Beta, Gamma, Delta, Epsilon, Zeta (Harvard), Eta (Yale), and Theta,—the Alpha, or mother chapter, passed out of existence.

From Epsilon and Zeta have descended the latter-day chapters of Phi Beta Kappa. Of the fate of Beta, Gamma, Delta, Eta, and Theta nothing is known. After a lapse of seventy years, William Short, of the mother chapter, at the age of ninety, traveled from Philadelphia to Williamsburg and revived the Alpha, which, however, soon succumbed to the vicissitudes of its college. It is not known what was its first follower. But of those whose activity have been continuous to date, Kappa Alpha, founded in 1825 at Union College, adopting with its Greek name a badge planned similarly to that of Phi Beta Kappa (except that it was suspended from one corner, instead of from the center of one of its equal sides), and inspired by similar ends, began

BERZELIUS HALL, S. S., YALE.

the career that has made it the mother of living Greek-letter societies. For Phi Beta Kappa has long since become an honorary, as distinguished from an active, institution, though the reunions of its chapters, especially of the old Zeta, "Alpha of Massachusetts,"—now the Massachusetts Alpha,—founded at Cambridge in 1779, are still noteworthy events.

Even before Phi Beta Kappa came into existence, Oliver Ellsworth, afterward Chief-Justice of the Supreme Court of the United States, had founded Clio Hall at Princeton, and a few years later, in 1769, Whig Hall arose at the same college with James Madison, afterward twice President of the United States, for its founder; and from that day to this these friendly rivals have never ceased to exert a healthful influence on the intellectual life of Princeton. These were the prototypes, and are the most vigorous survivals, of what, for nearly a century, were the most flourishing and numerous of student societies—the twin literary societies, or "halls," generally secret, and always intense in mutual rivalry, which have been institutions at every leading college in the land.

Another and a third, though less homogeneous, class of student societies may be best described by noting separately its only important examples—at Harvard and Yale. The Hasty Pudding Club of Harvard also took its rise in those interesting and formative years just subsequent to the close of the Revolutionary war, and was founded, as its constitution says, "to cherish the feelings of friendship and patriotism." For the display of the latter virtue the club for many years was wont to celebrate Washington's Birthday with oration and poem, with toasts and punch. Alas, for these degenerate days! Conventional

theatricals have taken the place of poem and oration, though, for aught I know, the toasts and punch may yet survive. "Two members in alphabetical order"—so ran the old by-laws—"shall provide a pot of hasty pudding for every meeting," and it is said that this practice is still religiously kept. That the banquet was not lightly considered by the old Harvard clubs may be seen in the tendency to exalt in the name of the club the peculiar feature of the club's fare, the Porcellian taking its name from the roasted pig—classical token of hospitality—that one of its bright young members provided for the entertainment of his fellows on a time when the feast fell to his providing. But the Porcellian has not wholly given itself up to the things that go with banqueting, for no other college society has so fine a library as it possesses. Indeed, its seven thousand well-selected and finely bound volumes might be coveted by many less fortunate small colleges. The A. D. Club is a younger rival of the "Pork," and, in the comfort of its house, the brilliancy of its dinners, and its good-fellowship, is by no means inferior. The development of this species of undergraduate activity has taken a widely different and rather unique form at Yale. The Yale senior societies are the most secret and clannish of college societies. No outsiders ever enter their buildings, and their goings and comings are so locked in mystery that one can only guess what their aims and purposes are. A passion for relic worship and a taste for politics are generally ascribed to both, though the class of men taken by Scroll and Key differs widely from that chosen by Skull

and Bones — the men of the former being selected, it is supposed, for their social position and qualities of good-fellowship, while those of the latter are usually good scholars or prominent athletes.

Thus we have the three classes of student societies — the old literary societies, still flourishing in the older colleges of the South, but languishing elsewhere, except at Princeton, where Clio and Whig are still the great institutions of the student body, and at Lafayette, where the Washington and Jefferson are scarcely less prosperous; the peculiar local institutions of Yale and Harvard, *sui generis* and not to be propagated; and the Greek-letter system of chartered fraternities, the chartered corporations of which are to-day the most prominent characteristic of American undergraduate social life.

The interval of thirty-five years from the founding of Kappa Alpha to the outbreak of the civil war was the golden age of these fraternities. They sprang up and multiplied with a persistency that should forever make firm the doctrine of the strengthening power of persecution. They were not confined to any one grade of college or to any particular part of the country. They flourished every-

where, and increased in number through almost every imaginable combination of the letters of the Greek alphabet. Many, of course, have vanished from the face of the earth. Of those that still remain, Delta Kappa Epsilon, founded at Yale in 1844, is the largest, and has now above 9000 members, representing 32 active chapters situated in 19 different States; Psi Upsilon, originated at Union in 1833, enrolls some 6600 members, distributed among 19 chapters in 10 States; and Alpha Delta Phi, founded at Hamilton in 1832, has a membership nearly as large. Delta Kappa Epsilon appears to have made good its claim to be recognized as a national institution; and while certain smaller fraternities are favorites in particular parts of the country, all barriers are rapidly disappearing before these three favorite societies in their march towards representation at all the important colleges of the country.

Though fraternities are organized less frequently now than formerly, because of the

DELTA KAPPA EPSILON HALL, ANN ARBOR.

increased difficulty of competing with those that have been long established, still, as the colleges themselves grow, the chapters of the most flourishing fraternities grow with them; so that the increase of the system, as a whole, is both very regular and very considerable. Up to 1883, the date at which the latest general manual of the fraternities appeared, there were enrolled among the 32 general college fraternities of this country, forming an aggregate of 505 active chapters, no less than 67,941 members, representing every possible profession and branch of business, every shade of religious and political opinion, and every State and Territory of the United States. But these figures by no means tell the whole story of

ALPHA TAU OMEGA HALL, SEWANEE.

ALPHA PHI (LADIES') LODGE, SYRACUSE.

the growth and spread of the "little" college fraternities. Many colleges and advanced technical schools in every section of the country, besides welcoming the general fraternities to their privileges, have ambitiously started and preserved local fraternities that are limited or have no branches at other institutions, but nevertheless often enjoy a large share of local patronage. These societies, of which there are 16 now in existence, had a membership of 4077. But this is not all. The female students, not to be outdone, about a dozen years ago began to organize sisterhoods, from which males were ignominiously debarred from membership, and had meantime succeeded in building up 7 prosperous societies, with 16 chapters and 2038 members, situated mostly in co-educational institutions. When to this grand total of 74,056 names are added the large membership of the Princeton halls, the Harvard clubs, and the Yale senior societies, already described, together with the very numerous class organizations in various colleges, it may be seen how firm a hold the spirit of co-operation has taken upon the collegians of the country. The fraternities have grown far away from the persecutions of their early days, when the hands of all men and faculties were raised against them. Because they met in secret, and held themselves free from the intrusion of the faculty for one night in the week, and adorned their poor little badges with Greek letters, all evil and rebellious conduct was charged against them. Though their purposes were sensible enough, and good rather than evil has come from them, a nameless stigma of bad parentage still rests upon the whole system, to live down which, by an overplus of actual and visible good attainment, has not been possible till within recent years. But prejudice has an unequal contest with conviction. Through persecution, and poverty of opportunity, and lack of means the new society men fought their way towards solid ground, finding in their struggles and in their ambitions for the success and honors of their fraternities an incentive and charm college life had till then never yielded.

Whatever may have been the shortcomings of the American college boy of a quarter of a century ago, want of energy was not one of them. To take off his coat and go to work with his hands seemed to him the most natural thing when he needed a society lodge. In this way was built, in 1855, the famous "log-cabin" of Delta Kappa Epsilon at Kenyon College, Gambier, Ohio. The site selected was a deep ravine, far away from any human dwelling. Neighboring farmers were hired to fell the trees and to raise the frame of this ark of a house, forty-five feet in length by ten in height. The entire chapter (including its youngest member, now an orator of national reputation several times elected to Congress) rested not until they had plastered the outside crevices with mud. Inside the room was nicely ceiled, and furnished with good tables and chairs, a carpet, and several pictures. The walls and roof of the building were ingeniously deadened with saw-dust and charcoal, so that not the remotest whispers could reach the ears of curious eavesdroppers, if any such should have the temerity to penetrate to the recesses of this sylvan retreat. "A cooking-stove, with skillet, griddles, and pots complete, was the pride of the premises," writes an old member, "where each hungry boy could roast his own potatoes, or cook his meat on a forked stick, in true bandit style."

DELTA KAPPA EPSILON LOG-CABIN, KENYON.

The building of this lodge gave a great impetus to the owning of society homesteads. Before this the various chapters had been accustomed to rendezvous stealthily in college garrets, at village hotels, or anywhere that circumstances and pursuing faculties made most convenient. But when the assurance was once gained that the fraternities might own their premises and make them permanent abiding-places, the whole system became straightway established on a lasting foundation. In 1861, at Yale, the parent chapter of

ALPHA DELTA PHI LODGE, ANN ARBOR.

the same fraternity, Delta Kappa Epsilon, built for itself a two-story hall in the form of a well-proportioned Greek temple, and this proved to be the beginning of a long epoch of more and more elaborate house-building, the culmination of which has scarcely been reached at the present day.

From the temple-shaped hall with its facilities for the routine work of the chapter, its dramatic and social festivities, the most enterprising fraternities progressed gradually towards ample homesteads, thoroughly equipped for dealing with every phase of student life, including the furnishing of comfortable board and lodging, which, in some features, excelled the average dormitories. The work began in earnest about fifteen years ago, but the past two or three years have excelled all the others combined, both in an intelligent understanding of what was needed to make the houses thoroughly habitable and creditable in appearance, and in the amount of superior work planned in detail or actually accomplished. A critical comparison of the specimens in existence reveals the fact that pretty nearly every kind of known architecture has been tried. At Princeton one may see in the twin temples of Whig and Clio copies of the Ionic architecture; at Cambridge, should he visit the A. D. Club, he could scarcely fail to notice

CHI PSI LODGE, AMHERST.

that this hospitable mansion is the veritable traditional New England homestead, with its air of little pretense and much comfort. At Yale, "Bones Hall" is venerable and picturesque when covered by the foliage of its ivy; the magnificent building of "Keys" is of Moorish pattern; the new "Wolf's Head" society, at the same college, honors our ancestors in the "Old Home" by choosing a corbel-stepped gable, "fretting the sky," to which the English and the Dutch of several centuries ago were noticeably partial; the stone Delta Psi lodges at New Haven and Hartford are veritable castles for strength and ruggedness of outline; no gentleman would need a more tasteful or finely located villa than one of the fraternity houses which he would find at Ithaca; while by Delta Kappa Epsilon at Amherst has been

DELTA PSI HALL, S. S. S., YALE.

introduced, and by Sigma Delta Chi at Yale has been elaborated, what seems probable to become the reigning type—that of "cloisters," in which are lodged the members, joined by gallery or covered way to the "chapel," where are celebrated the rites of the chapter.

If the fraternities as a whole have had a weakness, it has been for what they were pleased to believe was the "Queen Anne style"—a "spread" of red bricks, irregular, very irregular, tile roofs, and an unknown quantity of bowed windows, with the usual accessories of modern stained-glass "Venetian" blinds, and unlimited opportunity for portières. These experiments, as embodied by some amateur architect, most likely a well-meaning but untrained member of the chapter, have not always been successful; but lately the bizarre mode has given way to better taste, and in all probability the next efforts of the fraternities

at house-building will be characterized by solidity rather than show, by harmony rather than conspicuousness. Several of the college faculties have, with the consent of their boards of trustees, presented enterprising societies with valuable building-sites on their grounds; and where their invitations have been accepted, they have no cause to regret their generosity.

In interior decoration the houses of the American college fraternities differ no less radically than in external appearance. At a Western lodge the members are often content with, and indeed think themselves fortunate if

EPSILON PHI LODGE, WILLIAMS.

of the three societies just named contains a strikingly beautiful emblematic window, designed by Tiffany & Co. of New York. The Samuel Eell's Memorial Hall, at Hamilton College, is itself a tribute to the brilliant young founder of the Alpha Delta Phi fraternity, who died after a short career of great promise at the Cincinnati bar as a law partner of the late Chief-Justice Chase. Other representative lodges have been built or beautified by the generosity of individuals.

With the aid of rich sons and generous parents and friends, the loading down of college lodge-rooms might easily be carried to an unfortunate extreme, especially if a false spirit of rivalry should gain a foothold in our college world. But at present there seems little danger of this. An honorable ambition prevails among the leaders of the best fraternities to make their homes complete and attractive in every particular, but beyond this they do not seek to go. The energies of those who

DELTA PSI LODGE, TRINITY.

they have at their command, the bare necessities of life, while not a few of the wealthy chapter-houses of the East are furnished with all the luxury and refined taste of the highest modern art as applied to club life. For instance, the lodge-room of the Delta Psi fraternity in New York City is magnificently furnished in Egyptian designs especially imported from Thebes for this purpose, at a cost of several thousands of dollars; and in the buildings of the Alpha Delta Phi at Wesleyan, the Psi Upsilon at Cornell, the Chi Psi at Amherst, and the Sigma Phi at Williams may be found wood-work, furniture, and objects of art which would be in no wise out of place in the most attractive of modern city homes. Several of the foremost chapters, such as the Sigma Phi, the Alpha Delta Phi, and the Kappa Alpha of Williams College, have been presented with valuable memorials by the friends or relatives of deceased members, which are introduced so as to form conspicuous features of the buildings. Thus the last

DELTA PSI HALL, NEW YORK CITY.

DELTA KAPPA EPSILON LODGE AND HALL, AMHERST.

have charge should be directed especially to adorning the chapter-houses with what illustrates and improves student life in general, and with what is of particular importance to the members of the college or university at which the chapter-house is located.

Of the value of the real and personal property belonging to the ten American college fraternities that are represented by at least one chapter-house each, and the leaders by

five or more, it may safely be said that the sum is fast approaching a million of dollars; while numerous other fraternities and chapters have well-invested and rapidly accumulating building-funds.

The fraternity literature is another interesting subject. The hideous reptiles and winged monsters, the burning altars and dungeon bars, and other such fantastic symbolism with which the magazines and newspapers of some of the fraternities are decorated, prove to cover interesting and oftentimes useful tables of contents, including reminiscences of college life and literary articles by prominent graduates, news-letters from the chapters at the different colleges, personal gossip concerning alumni, official notices from the officers of the fraternity, editorial comments, and notes from exchanges. Two or three of these society periodicals have attained a large circulation. The fraternities have not confined their energies to current papers, however, but have compiled elaborate record books of their members, in the form of catalogues, which, besides containing the names and occupations of members, give succinct sketches of the chapters and the colleges at which they are situate, interesting tables of residence and relationship, and brief biographical sketches of the most distinguished graduates. But decidedly the freshest and most characteristic literature possessed by the fraternities are their song-books, where,

ALPHA DELTA PHI LODGE, WILLIAMS (MEMORIAL PORCH).

in varied and not always correct verse, the youthful laureates have sung the praises of their clans, comrades, festal nights, the charms of good-fellowship, and many other such tempting themes for the imagination and the heart.

Till about a dozen years ago few or none of the fraternities had a strong executive government, but were managed by the oldest chapter, or by several chapters in turn, and by the hasty edicts of the general conventions of the order. But this system proving inadequate, the leaders conceived and boldly acted on the idea of taking the general executive administration of the college fraternities out of the hands of the undergraduate members, at the same time appealing to the graduate members to assume an active share in their welfare. So far their success has been noteworthy. The graduate councils, which now form the executive department of most of the leading fraternities, are ably managed, and graduate associations of the larger fraternities have been formed in most of the important cities. They hold reunions, banquets, and business meetings, and in most essentials serve as graduate chapters of their orders, cementing old college ties and forming new ones between members of different colleges; and several of the fraternities, such as the Delta Psi, the Delta Phi, the Delta Kappa Epsilon, the Alpha Delta Phi, the Psi Upsilon, the Zeta Psi, and the Delta Upsilon, have lately taken the advanced step of establishing in the large cities regular club-houses, which are well equipped, and well patronized by men of all ages; while at Chautauqua, the "Wooglin" club-house, with its ample accommodations and grounds, is the summer headquarters of the Beta Theta Pi, by a graduate corporation of which it is owned.

The legislative functions of the fraternities still rest with the annual conventions, which are usually held with the different undergraduate chapters in turn, when, be-

FIELD MEMORIAL WINDOW, KAPPA ALPHA LODGE, WILLIAMS.

sides the transaction of routine business, the several hundred students present from all parts of the country are occupied with social courtesies extended to them by local residents, and with literary efforts in the form of orations and poems, often delivered by members of the fraternity who have attained eminence in public life.

In view of the facts already presented in the course of this narrative, a defense of the fraternities, a summing-up of all the reasons on which their existence and continuance might be justified, seems altogether superfluous. This one significant feature of the case may however be offered to the dubious without comment, as pointing its own moral—that so far, whenever the majesty of the law has been invoked by still obstinate faculties or trustees to drive the fraternities from their institutions, the law has upheld the continuance of the societies and the free rights of the students to join them, provided that in doing so they do not violate any of the proper functions of the college. It was so in 1879, when the faculty of the University of California tried to disband a society which had been allowed to erect a house on college land, and was met by the hostile criticisms of the entire press of that State; it was so in 1882, when the president of Purdue University, Indiana, striving to compel students entering his university not to join any of the societies, was prevented by a decision of the superior court of that State, and in the end resigned his office. The one notable exception to this rule is the case of the College of New Jersey. Here the faculty succeeded in expelling all the fraternities; but it was before the era of their house-building. All of those chapters

KAPPA ALPHA LODGE, WILLIAMS.

PHI KAPPA PSI (MEMORIAL) LODGE, GETTYSBURG.

which have built houses are now incorporated institutions, paying taxes on their real and personal property, and entitled to the full privileges and protection of local and State laws.

They therefore appear to rest on a more solid basis than mere sufferance; and however ardently certain individuals may wish to see them abolished, it is extremely doubtful if even an organized crusade against them, headed by all the college presidents in the United States and the majority of the faculties under them, could succeed in doing more than to drive the reputable societies into a temporary seclusion, from which, in a few years, they would emerge stronger than ever. Such at least has been the case at many representative institutions.

But the above supposition is relegated to the realms of the impossible when one discovers that a large portion of the educators referred to are themselves members of the fraternities, and in many cases actively associated with their progress. This list includes such men as President Eliot of Harvard, Dwight of Yale, Walker of the Boston Institute of Technology, Seelye of Amherst, White of Cornell, Dwight of the Columbia Law School, Gilman of Johns Hopkins University, Johnston of Tulane, and Northrop of the University of Minnesota. There is not a faculty of any size in the United States that does not contain society members, and few professorial chairs at the largest colleges are not filled by representatives of the leading fraternities. These "little societies" have supplied forty governors to most of the largest States of the Union; and had in the last administration the President of the United States and the majority of his Cabinet. On the Supreme Bench of the United States the fraternities are now represented by five of the associate justices. A summary, published in 1885, showed Alpha Delta Phi, Psi Upsilon, and Delta Kappa Epsilon to have furnished of United States senators and representatives 39, 25, and 36

respectively; while in the last Congress 13 representatives and 2 senators were members of the last-named fraternity alone; and in the membership of these 3 fraternities are included 24 bishops of the Protestant Episcopal Church. In the class-room they are represented by Whitney and Marsh; in the pulpit, by R. S. Storrs and Phillips Brooks; in the paths of literature, by James Russell Lowell, George William Curtis, Donald G. Mitchell, Charles Dudley Warner, Edward Everett Hale, and E. C. Stedman; in recent public life, by Presidents Arthur and Garfield, by Wayne MacVeagh, Charles S. Fairchild, Robert T. Lincoln, John D. Long, William M. Evarts, Joseph R. Hawley, and William Walter Phelps. These gentlemen were not elected into the fraternities after graduation, but were active supporters of these organizations during their undergraduate days. Whatever, then, may be the shortcomings of college secret societies, it is to their credit that their exponents are men noted for ability and prominence in every useful sphere of life, as well as for mere culture and congeniality, while from end to end of the catalogued chapter-lists run in thick procession the starred names of the most brilliant and lamented of the young officers who fell in the battles of our civil war—in the blue and gray ranks alike. Judging the system by its deeds only, it is difficult to escape the conclusion that the best societies have in reality been groups of picked men among the fortunate few, comparatively speaking, who are able to incur the expense of a college education.

In almost every college where the secret societies have flourished attempts have been made, some of them quite successful, to carry on local anti-secret societies; and there has existed for many years an anti-secret fraternity, with chapters placed in different colleges, which has been patterned very closely after the societies calling themselves secret, both as to means and ends. But in one case only, that of Delta Upsilon, have the anti-secret orders

DELTA PSI LODGE, WILLIAMS.

PSI UPSILON LODGE, HAMILTON.

been able to keep pace with their secret rivals, in either the quality of their membership, their activity in college affairs, or their increase in material resources. Even here this has been the result of assimilation to the secret fraternities, till now, so far as Delta Upsilon can effect it, the distinction between itself and the secret fraternities is simply that the latter exposes somewhat more private business than do they, and, as to the rest, terms "privacy" what they call "secrecy."

Mr. Warner has said:

Notwithstanding their formation is only in obedience to an ancient and universal love in human nature, they are attacked because they are secret. I suppose that some of them are guardians of the occult mysteries of Egypt and India, that they know what once was only known to augurs, flamens, and vestal virgins, and perhaps to the priests of Osiris; others keep some secret knowledge of the formation of the alphabet, or preserve the secret of nature preserved in the Rule of Three, and know why it was not the Rule of Four; while others, in midnight conclave, study the ratio of the cylinder to the inscribed sphere. It matters not. I have never yet met any one who knew these secrets, whatever they are, who thought there was any moral dynamite in them; never one who had shared them who did not acknowledge their wholesome influence in his college life. I mean, of course, the reputable societies; I am acquainted with no other.

The constitutions of many college fraternities are now open to the inspection of faculties; the most vigorous publish detailed accounts of their conventions and social gatherings; nearly all of the homesteads are on occasions opened for the reception of visitors; their rites, ceremonies, and even the appearance of their *sancta sanctorum*, are quite accurately apprehended by rival societies—in short, the old shibboleth of secrecy is a myth rather than a reality.

The shrewdest college presidents have long since discovered that to control undergraduate action with a firm though gentle hand they have only frankly to bespeak the aid and win the confidence and assistance of the fraternities represented at their institutions. It is thus

that we come to see and to realize the importance of such unique departures from the traditional, ever-antagonistic relations between the faculties and the students of large colleges as those lately put into operation at Amherst, Bowdoin, and other colleges; where all matters relating to the privileges and penalties of the students are adjusted to a code of laws which is administered, and from time to time amended, by a council of undergraduates, representing the fraternities, acting in concert with one or more members of the faculty. This simple and amicable relationship between those desiring to obtain knowledge and those desiring to impart it has already been attended with very gratifying results.

Illustrated by such cases as that of Amherst and Bowdoin, and reinforced by the healthy tone of the fraternity press, which has not failed to wage war on what is reprehensible or deficient in our college life, and has labored to inculcate in their members the obligations which they owe to their college and to the members of rival societies as well as of their own, the words of General Stewart L. Woodford, in speaking of the early days of the societies, seem amply justified, and to promise even larger and still more excellent fruit in the near future:

To no one cause more than to the fraternity movement has been due the altered conditions of college culture. . . . In matters of study and discipline each student is now largely guided by his personal predilections, by the advice of those whom he sees fit to consult, by the moral force of his chosen associates. These associations are now determined in many colleges by the Greek-letter societies or fraternities.

PHI NU THETA LODGE, WESLEVAN.

DELTA Upsilon LODGE, MADISON.

That they can use without abusing their privileges was very well expressed by President White, at the dedication of the new Psi Upsilon house at Cornell:

Both theory and experience show us that when a body of young men in a university like this are given a piece of property, a house, its surroundings, its reputation, which for the time being is their own, for which they are responsible, in which they take pride, they will treat it carefully, lovingly, because the honor of the society they love is bound up in it.

He added the following profound observations as the result of his long experience, both here and abroad:

One of the most unpleasant things in college life hitherto has been the fact that the students have considered themselves as practically something more than boys, and therefore not under tutors and governors; but something less than men, and therefore not amenable to the ordinary laws of society. Neither the dormitory nor the students' boarding-house is calculated to better this condition of things, for neither has any influence in developing the sense of manly responsibility in a student. But houses such as I am happy to say this society and its sister societies are to erect on these grounds seem to solve the problem in a far better way. They give excellent accommodations at reasonable prices; they can be arranged in such a manner and governed by such rules as to promote seclusion for study during working-hours; they afford opportunities for the alumni and older students to exercise a good influence upon the younger; they give those provisions for the maintenance of health which can hardly be expected in student barracks, or in the ordinary student boarding-house, and in the long run can be made more economical. But what I prize most of all in a house like this is its educating value; for such a house tends to take those who live in it out of the category of boys and to place them in the category of men. To use an old English phrase, it gives them "a stake in the country."

President Seelye of Amherst College, in an address on June 28, 1887, states, referring to the Greek-letter fraternities:

The aim of these societies is, I say, improvement in literary culture and in manly character, and this aim is reasonably justified by the results. It is not accidental that the foremost men in college, as a rule, belong to some of these societies. That each society should

seek for its membership the best scholars, the best writers and speakers, the best men of a class, shows well where its strength is thought to lie. A student entering one of these societies finds a healthy stimulus in the repute which his fraternity shall share from his successful work. The rivalry of individuals loses much of its narrowness, and almost all of its envy, when the prize which the individual seeks is valued chiefly for its benefit to the fellowship to which he belongs. Doubtless members of these societies often remain narrow-minded and laggard in the race, after all the influence of their society has been expended upon them, but the influence is a broadening and a quickening one notwithstanding. Under its power the self-conceit of a young man is more likely to give way to self-control than otherwise. . . .

To represent all the fraternities as standing on anything like the same high plane as to membership, progress in the past, and prospects for the future would be misleading. My thoughts have naturally turned to the standing, the equipment, the aspirations, or perhaps only the pretty dreams of those fraternities which deserve to be ranked as the leaders in the race — that some day all the colleges of the United States will be veritable and acknowledged student democracies; that the fraternity buildings, though smaller than the college halls, will equal the latter in durability and completeness of appointment; that all the large cities will have graduate clubs, where the college fraternity man can renew the old associations that he cherished when a student.

The leading fraternities are fond of affirming the difference in their standard qualifications for membership. Some venerate high scholarship; others pride themselves on the aristocracy of birth or wealth; still others recognize the claims of a heartier and more democratic spirit. This may be true; and yet in all of them there is enough good-fellowship to attract the cultured and enough culture to

PSI Upsilon LODGE, TRINITY.

improve the sociable. They illustrate a law of nature and a law of man, in the tendency of atoms with affinities to form into groups. Having outgrown weaknesses and prejudices, they may be expected to enjoy a career of prosperity.

John Addison Porter.

HARD TIMES IN THE CONFEDERACY.

WITH emotions of mingled pain and pleasure, akin to those that come at hearing once again a familiar air, the echo of whose last cadence vanished years ago, so the reminiscences of the many makeshifts and expedients for maintaining life and a degree of comfort recur to the minds of those who, in the Southern Confederacy, struggled through the period embraced within the years 1861 and 1865. The blood-stained battle-fields where the hosts of contending armies met in deadly conflict witnessed no finer examples of courage and self-abnegation than did the chimney-sides and roof-trees of those times, where the ragged rebels had left wives and mothers and children and slaves to keep the household gods together, to raise the stint of corn and wine and oil, and to tend the flocks whereby they all might be clothed and fed.

It savors more of the ludicrous, perhaps, than of the desperately serious to be told in these latter days of how great an amount of money it took then to buy even the scant supplies of food and clothes which served to ward off cold and subdue hunger. If the State militia officer of the present who arrays his fine figure in the prescribed uniform of his command, at the moderate cost of some fifty or sixty dollars, had worn the Confederate "army worms" on his sleeve some twenty odd years back, he then could not have disported himself in such an outfit of trousers, coat, and vest for a less sum than twelve or fifteen hundred dollars of the currency at that time in vogue south of Mason and Dixon's line. Or had he been then as now, perchance, a *beau sabreur*, as some of that day were, with a love for the pomp and circumstance of war, though possessing withal the fine spirit of the *gants glacés* of De Preslin at Rethel, in the war of the Fronde, he doubtless would have affected the popular fashion of a soft slouch hat with a black plume waving from it and the brim upheld by a glittering star; and this gay headgear would have cost him a cool two hundred dollars of Confederate currency. But they were few in number who could wear fine uniforms even in the earlier days of the conflict; and in the latter years the prices of all commodities rose in a steady scale—save only that of one, which remained for the most part steadfast

and immovable from first to last, and that one was military service.

The privilege of fighting, bleeding, and even dying for one's unhappy country was in those days an inestimable boon which outweighed every sordid consideration of Confederate promises to pay—at least in the opinion of the higher authorities; and when a pound of tea from Nassau brought five hundred dollars, and a pair of cavalry boots six hundred dollars in that ridiculous medium of exchange, the pay of the private soldier of the Army of Northern Virginia was about eight dollars a month! Though there be something ludicrous in it all, the humor of it touches so nearly the outer edge of the heroic as to seem strangely like pathos.

Even where the money was to be had, the materials for handsome uniforms were not; and it is said that the insignia of rank on the sleeves and collar of a distinguished Confederate general were made by his wife from pieces of yellow flannel which before the war had been one of his children's petticoats.

Style and material were, after all, mere matters of individual gratification; for the army cared little what manner of raiment officers or comrades wore, save to make "b'iled" shirts, and a superfluity of finery wherever visible, subjects of infinite jest. The soldiers were as ready to cheer the dingy little forage cap of the puritan Stonewall Jackson when he trotted down the lines as to salute with applause the plumed chapeau of the dashing cavalier Stuart.

The traditional rebel soldier in the persimmon tree, who told his captain that he was eating the green persimmons in order to fit his mouth to the size of his rations, epitomized in his epigrammatic speech the history of the economic conditions of the Southern States, both in the field and at home, during the war of the Rebellion. After the seaports of the South had once become thoroughly blockaded, it was a continuous, and in the end unavailing, struggle on the part of the people of the Confederacy to accommodate the status of supply to that of demand.

After the war ended, a monthly magazine dedicated to perpetuating the records of the war from a Southern standpoint, and soon perishing in the vain endeavor, published a rude wood-cut, which, with its concomitant inscription, expressed with great pith and point

the extremities to which soldiers and homelike were reduced in the latter days of the contest. It represented two lank, lean, lantern-jawed Confederates in a blackberry patch. One of them, on his knees, the more readily to reach the palatable fruit, is looking upward at his comrade with a grim smile, and saying:

"They can't starve us, nohow, as long as blackberries last."

The vein of his self-gratulation and assurance is readily acquiesced in and reinforced by the other, who responds in a spirit of apt commendation, and with an even larger and more catholic faith:

"Naw, sir! And not as long as thar's huckleberries, nuther. And when they're gone, come 'simmons!"

To the uninitiated stranger who saw and read, the rude cut and its underwritten legend, if considered at all, doubtless were held coarse and witless; but to him who knew the bitter meaning thereof, through his own harsh experience, they spoke with the emphasis of a stern and powerful significance.

We read with a shudder of the dire straits to which the denizens of beleaguered cities are often subjected, when unclean animals and unwholesome refuse become the sole means of subsistence, and rejoice to think that such vicissitudes are few and far between. But it is no exaggeration to say, that, while only in exceptional instances were the Southern people reduced to such a pass, yet, from the day when the Federal fleet blockaded the harbors and forts of the Confederacy, their wants often left them not very many degrees removed from the condition of besieged people in the latter stages of beleaguement.

While the ratio of cold and hunger experienced was in an inverse order to that of comparative physical comfort the country was full of suffering, and thousands of people who had been reared and had lived in the extremes of ease and affluence were for months and years without what are believed, from the standpoint of the present, to be the commonest necessities of daily life.

The blockade-runners made at intervals perilous trips from Wilmington and Charleston to Nassau and back, carrying out cargoes of cotton and bringing in supplies. But these scanty imports were only a drop in the great empty bucket of want; and the South was forced to rely upon its own products, its own industry, and its own ingenuity to meet the demands of physical and social existence. The sudden realization of this duty of the hour was a greater shock to the inert and indolent South of that time than even that of arms; yet the deductive philosopher, speculating upon the origin and progress of the great

material growth and prosperity attained within the last two decades by the States once in rebellion, may well be led to attribute to this growth and prosperity the initial leaven of a highly wrought self-reliance and courage born of the sacrifices and struggles of that period. The women of the Confederacy learned the moral of the chapter even between the hard lines of its beginning; and it is by the men born of these mothers that the new South has been enabled to rise from the ashes of the old.

Forcing its producing capacity to the utmost limit that the crippled condition of labor would allow, and straining its ingenuity until that ingenuity threatened to give way, food and clothing at last failed the people of the South. The want of these things was the indomitable engineer who cleared the way for Sherman's march to the sea, the unanswerable herald who summoned Lee to Grant's presence at Appomattox Court House. It is no reflection upon the great generals of the Union to say, as the historian must, that the Federal navy, bringing the blockade, brought the hard times to the Confederacy, and that the hard times hastened its fall.

With the markets of Europe left open to its cotton, and with powerful friends at the courts of England and of France, whose friendship perhaps would have assumed a more substantial form but for the environing Federal fleet, who can prophesy what might not have been the fate of the young Government? But with its most important staple thrown almost valueless upon its hands, the moral no less than the physical effect of the blockade upon its fortunes was tremendous. The land that had laughed aloud with plenty under the bounteous and beneficent rule of King Cotton saw the scepter of that sway depart from it, and was sad. The free-trade, carried on without let or hindrance, wherever any trade was possible among the seceded States, which lay for the most part in a common latitude, and the variety of whose products was very slight, constituted a profoundly insignificant item when weighed in the balance against the no-trade of a vast outside world, producing all things that the wants of man might require. Of manufactures the South of that time knew absolutely nothing. She had no fisheries—or, having them, the blockade would have ended them. The mineral wealth that lay beneath the surface in many of her States was enveloped in a density of ignorance that was only accentuated by the scattered charcoal iron-furnaces set at wide intervals here and there in the Virginia or Georgia or east Tennessee hills, like faintly glimmering stars on the border of the great dark.

And yet during the hard times rude manufactures of various kinds were initiated, and the charcoal furnaces were multiplied. The cotton which could not be sold to Europe was made into cloth at home, and from the iron that ran molten from the scattered furnaces were wrought the death-dealing cannon of an historic army.

The currency of the new Government was from the beginning weighted down with a collateral condition which, though it had small effect on patriotism, caused no slight anxiety in the breast of far-seeing and circumspect men. This weighty condition was the promise to pay the stipulated amount of each note to the bearer of the imprinted piece of paper only at the expiration of a specified period of time "after the ratification of a treaty of peace between the Confederate States and the United States of America." In the final issue the anxiety and doubt of caution were fully justified, for no treaty of peace was ever concluded between the Governments named in the elusive bond. Neither blood nor flesh might redeem the ill-starred paper from the Shylock of defeat.

This element of uncertainty made the value of the currency as shifting and mutable as the fortunes of the armies of its Government; but a cause of depreciation much more potent and far reaching was the diminution and final cessation of the cotton traffic by reason of the blockade.

The continental currency of the Revolution, floated on the tentative credit of a feeble and undeveloped country, did not lose its value any more rapidly than did this money of a confederation of some of the wealthiest and most prosperous States on the North American continent.

The dollar and ten cents of Confederate money which in September, 1861, would buy as much as a gold dollar of the United States, was worth in September, 1864, only about one-twenty-seventh of a gold dollar, and would buy scarcely anything, because it had no circula-

tion anywhere except in the Confederacy, and at that time there was hardly anything in the Confederacy for sale.* The very color in which the calamitous currency was printed seemed ominous; and with its systematic and rapid decline the fortunes of the embryo Government which it represented took on a cerulean and unpropitious hue. Finally it became so valueless for all purposes of trade that many, looking for an early and untoward ending of the struggle, refused to accept it at all. It was in vain that in many sections indignation meetings were held by the more patriotic in which those who declined it were denounced; for numbers of tradesmen and professional men alike advertised in the current newspapers that they would none of it, and that their dealings would be "by way of barter and exchange alone."

At an earlier period the theory had seemed to prevail that it was impossible for too much money to be afloat; and though the Government presses groaned beneath their steady output of Confederate treasury-notes, and the Register and the Treasurer of the Confederate States were reduced to the extremity of hiring men to sign the almost innumerable bills for them, State treasury-notes were circulated in profusion, while "wild-cat" bank-notes of all sorts, shapes, and sizes vied with the "shin-plaster" utterances of municipalities, private corporations, firms, and individuals in supplying the popular demand.

Counterfeiting must have been an easy task; but if counterfeits were circulated, they were received without question when every man who could hire a printing-press and write his name had the power to make as much money as he would.

This overflowing deluge of fiat money alarmed and dissipated the old-fashioned gold and silver coins of our progenitors, which fled incontinently, as they will do under such circumstances, to the coffers of the cautious and the stockings of the saving. Supplies of food and clothing, with a sturdy contempt

* The following is a table of values of Confederate money adopted by the courts of Virginia after the war for convenience in settlements of transactions in that currency:

	1861	1862	1863	1864	1865
January.....		\$1.25	\$3.00	\$20.00 to 20.50	\$45.00 to 60.00
February.....		1.25	4.05	22.50 to 25.00	45.00 to 65.00
March.....		1.30	5.00	23.00 to 24.50	60.00 to 70.00
April.....		1.40	5.50	22.00 to 23.00	60.00
May.....	\$1.10	1.50	5.50	18.00 to 21.00
June.....	1.10	1.50	7.00 to 8.00	17.00 to 19.00
July.....	1.10	1.50	9.00	20.00 to 23.00
August.....	1.10	1.50	12.00 to 13.00	22.50 to 25.00
September.....	1.10	2.50	12.00 to 13.00	22.50 to 27.50
October.....	1.15	2.50	14.00	26.00 to 27.00
November.....	1.15	3.00	15.00 to 17.00	27.50 to 33.50
December.....	1.20	3.00	18.00 to 20.00	34.00 to 49.00

for such an absurd financial theory, stoutly declined to lend it any countenance, and became monthly less purchasable than before.

Such a staple and necessary article of food as salt advanced within two months during the first year of the war from ten to eighteen dollars per sack, and from this time on continued to show a steady increase in price to the end, in spite of the fact that the salt springs and "licks" of Virginia, east Tennessee, and the Indian Territory were furnishing constantly large quantities of it.

Every article of food increased in price in a similar ratio; and the market reports of produce and supplies in contemporaneous Confederate journals present a strange contrast from month to month and year to year. Perhaps the most striking instance of the advance in prices of food supplies occurs in the case of flour, which in March, 1863, sold for \$25 per barrel; in January, 1864, for \$95 per barrel; and in January, 1865, for \$1000 per barrel. The spectral army in the Confederate rear, led by General Hard Times, was closing up its ranks, touching elbows, and moving at a double-quick in those days of January, 1865. There was death at the cannon's mouth in front of the hungry, foot-sore, shivering rebel, and starvation in the rear.

Even so early as February, 1863, the money value of a day's rations for 100 soldiers, which had in the first year of the war been about \$9, was at market prices \$123. In the corresponding month of the following year a day's rations had no estimated market value. From the soldier who possessed them money could not buy them, and he who was without them was unable to procure them at any price.

Side by side with the reports of battles and the records of peace commissions, congresses, and legislatures, the blurred columns of the Confederate press were wont to teem with domestic recipes for cheap dishes, directions for raising and utilizing various vegetable products, instructions for making much of little in matters pertaining to every phase of household life. Hard by a list of dead and wounded would stand a recipe for tanning dog-skins for gloves; while the paragraphs just succeeding the closing column of the description of a naval engagement off Hampton Roads were directions for the use of boneset as a substitute for quinine.

The journals of that day were printed usually upon the poorest paper, made of straw and cotton rags, and so brittle that the slightest touch mutilated it. The ink, like the paper, was of the cheapest and commonest, and left its impression, not only on the face of the

sheet, but on the hands no less than on the mind of the reader. Few fonts of new type found their way into the Confederacy during the war, and at the end of four years the facilities for printing had come to a low ebb. It was no uncommon thing for publishers to issue half-sheets in lieu of a complete paper, with scarcely an apology to subscribers for the curtailment of their literary and news rations. It was generally understood that this happened only through stern necessity, and not from any disposition on the part of the newspaper men to give less than an equivalent for the subscription price. Sometimes the journal which on yesterday appeared in all the glory of a six-column page was to-day cut down to a four-column half-sheet; or publication was suspended with the announcement that the stock of materials had been exhausted, and that as soon as the office could be replenished publication would be resumed. Eagerly as the rough sheets were looked for and closely as they were read, a diminution of matter in them, or a failure to appear, caused only passing comment or dissatisfaction. Men's minds were so filled with the thousand things that each day brought forth about them, there were so many rumors in the air, and news flew so rapidly even without newspaper aid, as to cause them not too greatly to miss that which to-day has come to be one of the veriest necessities of American life—a daily journal full of all the doings of all the world.

Sometimes even the coarse straw-paper failed the publishing fraternity when an edition was absolutely imperative; yet in such emergency the inventive talent never deserted them. It was considered a wonderful journalistic feat on the part of its publishers for the Vicksburg "Citizen," during the siege of that city, to make its appearance, when all other resources had failed, upon wall-paper.

Publishers of books and sheet music occupied a scarcely less helpless condition than the newspaper people. Their sole grounds of superiority consisted in the fact that the demands upon them were not so urgent. The girl who sang to her soldier lover the popular songs of that time, "Lorena," "When this Cruel War is Over," "The Standard-bearer," or "Harp of the South,"—which were all duly advertised "at the retail price of one dollar per sheet; the trade supplied, however, at half off, with an additional discount where one hundred of one piece are ordered,"—did not experience that immediate and insistent need of the song and its music which men and women alike felt for the newspaper that would tell them where the last battle had been fought, which army had been victorious, who had been promoted, and who had fallen. The

fateful column might contain evil or good report of some dear one, and its coming was full of interest and apprehension. Yet the sheet music, printed, like the newspapers, in the roughest style, upon the commonest paper, with now and then a caricatured lithographic likeness of some Confederate general on the title-page, continued to be sold and sung, even though its price ran from one to two dollars per sheet.

War songs and war music were the order of the day; and the soldiers in the camps and the small boys in ragged jackets shouted, with an equal zest,

"The despot's heel is on thy shore!"

or

"Farewell forever to the Star-spangled Banner!"

from diminutive paper-covered books of martial ballads. The little song-books cost anywhere from two and a half to five Confederate dollars; and their contents, with a few notable exceptions, were as mediocre as the paper on which they were printed. The sentiment was there, nevertheless; and this was cared for by the singers more than the music or the lyrical or literary excellence of the songs.

The missionary and religious publishing houses never ceased their praiseworthy labor of printing tracts and pamphlets for distribution among the soldiers; but publications of a more ambitious or secular standard were very few. Now and then some adventurous firm in Richmond or Charleston or New Orleans would issue a badly printed edition of a new novel, reproduced from a copy smuggled in "through the lines" or brought by the blockade-runners from Nassau. Still, even "John Halifax, Gentleman," and "Les Misérables," which first appeared in the South in this way and this dress, lost much of their attractiveness in their Confederate garb of inferior ink, bad type, and worse paper.

Reminiscence of books and papers of the period recalls the dire and unfilled want of every species of stationery in each household, and the rough devices which were resorted to for supplying such deficiencies. It was a time when any individual who wished to use an envelope might be compelled first to make it, after the theory of "first catch your hare," etc. The manner of their making was to cut them out of paper by a tin or pasteboard pattern, and fasten the flaps either with glue manufactured from the gum of the cherry-tree, or with ordinary flour-paste. Old desks and secretaries were ransacked, and frequently not unsuccessfully, for the red wafers or the sealing wax of an earlier date. Even the most stylish

and fashionable note paper for correspondence had an extremely unstylish texture, to say nothing of its hue, that ill comported with the red wax stamped with a crested coat of arms. The juice of poke-berries, compounded with vinegar, or the distillation of a vegetable product known as "ink balls," usurped the place of ink, and faded from its original purple or crimson color with great rapidity to one of ugly rust. Steel pens were scarcely to be had for love or Confederate money; and the forgotten accomplishment of trimming a gray goose-quill to a good nib came to be once more an accomplishment with an ascertained value. The mucilage on the backs of the ill-engraved blue ten-cent stamps, adorned with the head of Jefferson Davis, often failed of its purpose; and the fingers, which were not infrequently tired enough after cutting out and making the envelope, trimming the pen, and writing the letter, must need still go through the labor of separating the stamps from each other with a pair of scissors or a penknife, and applying flour-paste to the back of the recalcitrant stamp, to insure the safe carriage of the missive of affection to the far-away soldier whose eyes might never read it.

The boys of that day, bereft of pencils, made them for themselves by melting bullets and pouring the molten lead into the cavity of small reeds from the cane brakes. Trimmed to a point, the home-made pencil, though its mark was faint, sufficed to serve the purposes of the young scribes and mathematicians.

It seems almost a figment of the fancy to recall in detail the array of makeshifts and devices which the hunger and thirst of the hard times compelled. We read with curious interest the item of news in the Virginia newspapers of January, 1865, that

Thompson Taylor, Esq., who had charge of the cooking of the New Year's dinner for the soldiers of General Lee's army, sold the surplus grease from the meats cooked to one of the railroad companies for seven dollars per pound.

If we might shut out the memories of the depreciation in value of Confederate money, and of the hardships and want prevalent in the Southern Confederacy at the time, we should doubtless wonder what strange army was this the remnants of whose magnificent viands could fetch so marvelous a sum; and haply recollections of the luxury and effeminacy of that innumerable array which the great king led into ancient Hellas would flit across our bewildered minds. Yet how different the reality; and how sharply the little item accentuates the story of privation and suffering! Provisions, which were plentiful enough in the days when the Yankees were to be "whipped

with corn-stalks," grew constantly scarcer and higher priced. The necessities of the life of to-day were the luxuries of that storm-and-stress time. With "seed-tick" coffee and ordinary brown sugar costing fabulous sums and almost impossible to be obtained, it is small matter of wonder that the unsatisfied appetite of the rebel sharpshooter at his post far to the front often impelled him, though at the risk of detection and death, to call a parley with the Yankee across the line, his nearest neighbor, and persuade him to a barter of the unwonted delicacies for a twist of Virginia homespun tobacco. Perhaps it never affected the mind of either with a sense of incongruity in their friendly dealings to reflect that the duty and the purpose of each was to shoot the other at the earliest opportunity after the cessation of the temporary truce and the return of each to his post.

Lovers of the fragrant after-dinner Mocha were forced to put up with a decoction of sweet potatoes that first had been cut into minute bits and dried on a scaffold in the sun as country housewives dry fruit, and then roasted and ground in a worn-out coffee-mill, or brayed in a mortar with a pestle. In yet more northern latitudes parched rye furnished even a poorer substitute for the Eastern berry; while coupled with the use of this last makeshift was the vulgar superstition that it produced blindness.

The old women and Dr. Johnsons of the Confederacy who could not exist without their fixed number of cups of tea a day drowned their happy memories of hyson in a solution of raspberry leaves, or the more medicinal preparation of the root of the sassafras bush. It was a gruesome time, and there were those who survived bullet and blade to surrender at last to indigestion and acute dyspepsia.

The number and character of intoxicating drinks were many and varied. Corn and rye whisky abounded; while in some latitudes pine tags and even potato peelings went into the impromptu still to come out pure "mountain dew." No internal revenue system aroused the ire of the untrammelled distillers, and alcoholic liquors were cheaper in proportion than most other commodities; yet the amount of drunkenness was not what might have been expected. A favorite small beer in those sections where the persimmon-trees flourished best was made of the fruit of that tree, and was called in the vernacular of at least one part of the Confederacy "'possum toddy."

Housekeepers and cooks racked memory and imagination to make dishes that combined the absolutely essential conditions of being at once cheap and nutritious. Housekeeping, even in old Virginia, famous for its cookery,

hung a dejected head; and the whole South was less in want of the army of cooks, which Horace Greeley said it so much needed when he visited it after the war's end, than of something for the army to cook. A rare and famous dish of those days was "Confederate duck" — a dish which would have done no discredit to the piping period of peace, and which grew rarer and more famous as the hard times came nearer home to the Confederacy. This peculiarly named fowl was no fowl at all, but a tender and juicy beefsteak rolled and pinioned around a stuffing of stale bread crumbs, buttered and duly seasoned, and roasted before a roaring fire with spit and drip-pan.

At home and abroad sorghum came to take the place of the vanished sugar. The children at home ate it in their ginger cakes, and the soldiers in camp drank it in their rye-coffee. The molasses and sugar of Louisiana were procurable in degree till the fall of Vicksburg; but the spirit of independence was rife, and each State desired and determined to rely as much as possible on its own products. The theory of State sovereignty was extended even to sorghum; and its introduction was hailed everywhere as one of the greatest boons of a beneficent Providence. The juice of the cane, extracted in a primitive fashion by crushing the stalks between wooden rollers revolving upon wooden cogs and impelled by horse-and-little-darkey power, was caught in an ordinary trough, boiled down into proper consistency in preserving kettles, kitchen pots, or whatever might be utilized for the purpose, and barreled for use as sorghum molasses. The syrup thus produced was quite a palatable one, with a slightly acidulous and not disagreeable flavor, but with an unpleasant tendency to make the mouth sore. It was known as "long-sweetening," in contradistinction to its predecessor, "short-sweetening," the sugar that was scarce.

From its use in the place of sugar sorghum soon leaped into high repute as an almost universal food staple. It was warranted to cure any case of hunger in man or beast. Writers in the suggestive daily press undertook in elaborate and exhaustive essays to show that sorghum syrup was nearly as nutritious as meat and an exceedingly good substitute for it, while the seed of the sorghum cane was capable of being ground into a meal that made a most excellent and wholesome brown bread. They claimed that the problem of blockaded existence had been solved in the discovery of a plant which produced in itself meat and bread for the human family and provender for cattle. Yet the average denizen of the Confederacy, whether at home or in the army, while rendering due credit to the inge-

nuity and skill with which the cause of the "food staple" was advocated by its champions, appealed to the higher arbitrament of his own digestion; and though willing to accord sorghum its real merit as serviceable and useful in the place of something better, he was always ready to exchange it for the more certain and familiar nutriment of bacon and "corn pone." To see it fulfill the functions of sugar in the latest recipe for Confederate coffee and tea was well enough; but quietly to submit to its usurpation of the high places of pork and corn was more than the appetite of hungry rebel-dom would endure.

There was a secondary use to which sorghum was put, in which it met with decided favor from a select few. This was its use in the manufacture of blacking. The manuscript recipe books of that day say that "wonderful shoe blacking, as good as Mason's best," can be made of sorghum molasses, pinewood soot, neat's-foot oil, and vinegar.

Yet, on the theory of the survival of the fittest, the average Confederate must have been right and the theoretic writers in the newspapers wrong about the value of sorghum; for bacon and corn bread have long since regained their wonted ascendancy in the South, and sorghum has vanished entirely from the fields where it once flourished, save, perhaps, where here and there some man and brother cultivates it yet in his little "truck patch," making "long-sweetening" for the consumption of his family in as primitive a method as that in which he helped his quondam owner to make it "endurin' o' the wah."

In the hardest times of the war period, when provisions were the scarcest, the larch to the larder of every Southern housekeeper hung out to each Southern soldier, no matter how ragged or humble. For him the best viands about the place were always prepared; and his was the high prerogative of receiving the last cup of real coffee, sweetened with the solitary remnant of sugar. With compassionate pity the women recognized the hardships in the army life of the Confederate soldier, and were always ungrudgingly ready to mitigate its severities in every possible manner.

"Costly thy habit as thy purse can buy" was a maxim of necessity in the hard times; for there was no raiment the subject of barter or sale which was inexpensive. Sporadic instances taken at random prove the general rule. In August, 1864, a private citizen's coat and vest, made of five yards of coarse homespun cloth, cost two hundred and thirty dollars exclusive of the price paid for the making. The trimmings consisted of old cravats; and for the cutting and putting together, a

country tailor charged fifty dollars. It is safe to say that the private citizen looked a veritable guy in his new suit, in spite of its heavy drain upon his pocket-book.

In January, 1865, the material for a lady's dress which before the war would have cost ten dollars could not be bought for less than five hundred. The masculine mind is unequal to the task of guessing how great a sum might have been had for bonnets "brought through the lines"; for in spite of patient self-sacrifice and unfaltering devotion at the bedside of the wounded in the hospital, or in ministering to the needs of relatives and dependents at home, the Southern women of those days are credited with as keen an interest in the fashions as women everywhere in civilized lands are apt to be in times of peace. It was natural that they should be so interested, even though that interest could in the main not reach beyond theory. Without it they often would have had a charm the less and a pang the more. Any feminine garment in the shape of cloak or bonnet or dress which chanced to come from the North was readily awarded its meed of praise, and reproduced by sharp-eyed observers, so far as the scarcity of materials would admit.

But fashion's rules were necessarily much relaxed in the Southern Confederacy so far as practice went when even such articles as pins brought through the blockade sold for twelve dollars a paper, and needles for ten, with not enough of either.

The superstition expressed in the couplet,

See a pin, and pick it up,
All the day you 'll have good luck,

gained its converts by the score; more, however, as can be readily imagined, for the sake of the pin itself, which it was a stroke of happy fortune to find and seize, than of any other good luck that was to accompany the finding. The broken needle of Confederate times did not go into the fire or out of the window, but was carefully laid aside until the red sealing wax of the ransacked desks and secretaries lent it a head wherewith to appear as a handsome and useful pin. To obtain the bare materials out of which to fashion garments for the family and for the servants soon became a serious question. The house-carpenter and the blacksmith were called into service to this end, and cotton once more became king, though of a greatly diminished sovereignty. Carding-combs of a rough pattern were constructed for the purpose of converting the raw cotton into batting, and thence into rolls of uniform length and size for spinning. The hum of the spindle and the clank of the loom-treadle were the

martial music with which the women at home met the fierce attacks of the legions of cold and nakedness.

Spinning-wheels, reels, bobbins, looms, and all the appurtenances for the weaving of cloth were made and used at home; and the toilers in the cotton-fields and the spinners in the loom-shed worked on contentedly, with a seemingly sublime indifference to the mighty struggle that was convulsing a continent for their sakes.

Of this dusky people it may here be said that, no matter what philanthropists, politicians, or philosophers have said of them in the past or shall prophesy of them in the future, they were true to every trust reposed in them; and with a most tremendous power for direct evil in their possession, the negroes of the South in the days of the civil war did naught but good. If the "colored troops" of the Union army "fought nobly," the slaves of the Southern plantation so bore themselves in those stirring times as to merit no smaller meed of praise.

Cotton and woolen fabrics of firm and substantial texture were woven, cut, and fashioned into garments for whites and blacks. Plentiful crops of flax reinforced the array of wool and cotton; and many a little flax-wheel which in the days of peace has since moved North to adorn in its newly gilded and beribboned state the boudoir of some æsthetic girl might tell pathetic tales of its former place of residence if the tongue of its tiny spindle had but speech.

The dyes of the forest wood-barks, of the sumac, of the Carolina indigo, and of the copperas from the numerous copperas wells were utilized to color the cloth thus woven. We read in the current newspapers that "a handsome brown dye" is made by a combination of red oak-bark and blue stone in boiling water; and that "a brilliant yellow" may be obtained by pouring boiling water upon other component parts of "sassafras, swamp bay, and butterfly root." The same authorities tell us that "vivid purples, reds, and greens" were produced from a composition of coal-oil and sorghum, tinted with the appropriate tree-bark; though of coal-oil for other purposes there was all too little. If a great similarity of quality and texture existed in the homespun cloth, the enumeration of the foregoing means of dyeing clearly demonstrates that there was at least opportunity for as great diversity of color as distinguished the famous coat of Joseph; though the reader of to-day is apt to look with some suspicion on the conspicuous forwardness of the adjectives "vivid," "brilliant," and "splendid," which always accompanied these talismanic recipes.

Strong thread for sewing was evolved from the little flax-wheels. For any unusually handsome work, if by any odd chance such work should happen to be demanded, sewing silk was procured in an emergency by raveling the fringes of old silk shawls or picking to pieces silk scraps which had survived time's touch, and carding, combing, and twisting them into fine threads. These little silken "hanks" were sometimes so prettily colored by means of the dyes that have been described, as to become in the eyes of the womankind of that generation almost as beautiful as the many shaded, dainty *filoselles* of the present are to the women of to-day.

In the old Greek philosophy the limitations of desire were the boundaries of happiness. Stern necessity inculcated in the minds of the people of the South the folly of desiring much, and they learned the lesson fully; but its knowledge disproved in their case the truth of the old pagan doctrine. There were so many cares and anxieties and apprehensions treading close upon each other's pinched and starving steps that happiness could not always sit, a tranquil guest, at the poverty-smitten fireside.

For hats and caps many were the quaint devices contrived. Men's silk hats were seldom seen, save in some battered and forsaken shape and style that bespoke the halcyon days "before the war." When in occasional instances they appeared trim and new with the nap lying smoothly one way, they were generally recognized to have come from Nassau with a blockade-runner, and known to have cost much money. Their wearers, however, were not objects of envy to those who saw them run the gauntlet of the soldiers' gibes, who with rough wit and often rougher words scoffed at the wearers at Rome of apparel that self-respecting Romans had long since ceased to wear. Even the conventional slouch hat of the South, which had divided the affections of its *jeunesse dorée* with the voluminously skirted broadcloth coat before Fort Sumter fell, and whose popularity was easily renewed after Appomattox, and still holds perennial sway, passed away in large measure with the later months of the Confederacy.

With the growth of "substitutes" in the matter of things inanimate to eat or to wear, "substitutes" decreased in the acceptance of the term as descriptive of those who for pecuniary consideration were willing to take others' places in the ranks. The military draft, which enrolled old men and boys, took also many of the batters of military age who had been left scattered through the Southern States, and then winter headgear got down to the bed-rock of coon and rabbit skins.

For making summer hats the Carolina palmetto leaf was in the greatest repute. Next in availability came wheat or rye straws, carefully selected with a view to size and quality, and bleached in the sun. The palmetto strips or the straws were first steeped in water to render them more pliable, and then plaited together by hand and sewed into proper shape. What constituted proper shape was usually a question to be solved only by the maker, and varied from the eminently picturesque to the decidedly grotesque or uncouth. If the hat of palmetto or straw was intended to adorn some feminine head, perchance a faded ribbon, redyed, or a gray partridge wing, lent it additional grace and beauty. In winter, home-woven hats, or knitted caps of the 'Tam o' Shanter type, were frequently seen. In spite of fashion's adverse though half-hearted decrees, young faces of those days seemed as sweet and winning under wide-brimmed "sundowns" or old time "pokes" as ever did those that have laughed beneath a "love of a bonnet" of a more *de rigueur* mode.

With the adjuncts of the female toilet the blockade made sad havoc. Silken stockings became undreamed-of luxuries; and their accompanying articles of apparel, which when first donned by a bride must always be composed of

Something old and something new,
Something borrowed and something blue,

fell far short of easy silk elastic, being made of knit yarn or cotton. Stockings of wool or cotton were the best that the most luxurious might aspire to. Shoe-strings were made in quantities by the children on little bobbins, or by plaiting or twisting threads together. Ladies' button boots were things almost unknown. Shoes were sometimes made of the pliant leather found in the flaps of disused cartridge-boxes and of the discarded belts of the soldiers. Oftener they were fashioned of cloth cut on the pattern of old shoes and sewed to leathern soles. Crinoline and corsets were constructed of hickory splints in lieu of whale-bone and steel springs; and the prepared bark of certain kinds of trees or certain plants furnished the ladies with a supply of braids and switches. Then as now, however, the style of arranging the tresses of the female head frequently changed under the dictates of a fashion feebly endeavoring to assert itself wherever possible; and at one time even a small amount of natural hair easily served the purpose of covering the crescent shaped pillows on which it was put up, the startling names of which were "rats" and "mice."

Buttons, pins, buckles, hooks and eyes dis-

appeared by degrees from the face of the Southern Confederacy. Some wooden buttons were turned upon lathes from maple and similar wood, and there were horn buttons here and there; but both species were for the most part clumsy and ill-shapen. The whites of the Confederacy were content with them, while the slaves skewered their "galluses" to their trousers with wooden pins or the thorns of the locust.

Combs were made of horn or wood; and bristle tooth-brushes were replaced with twigs of the dog-wood, the black-gum, the sweet-gum, and the althea. The latter was especially valued as serving the double purpose of brush and dentifrice at once.

Turkey-wing fans and fans of peacock feathers supplanted those of a more or less artistic and elaborate design and finish; and many other articles of use or ornament, dear to the feminine heart and not easily attainable, were ingeniously simulated.

In February, 1864, it was officially announced that two hundred soldiers of the Stonewall Brigade were entirely without shoes. The statement indicates the great stress of poverty in respect to leather. The slave population in the farther South went barefoot in the summer and wore "wooden bottoms" in the winter. Men of the easiest circumstances, as easy circumstances then went, were forced to be content with shoes of the coarsest. To shoe the Army of Northern Virginia had made a dearth of leather in the South, and every method of economy was practiced to avoid further trouble on this score. The "wooden bottoms" of the slaves resembled in some respects the wooden shoes of the French peasantry. The upper-leather was that of the ordinary shoe, and was fastened by means of small wrought-iron nails to a sole and heel cut carefully to fit the bottom of the foot from a solid block of cypress wood. Their novelty, when first introduced among the negroes, made captive the fancy of the children of both races; and juvenile wooden bottoms were the rage for a long time.

As the years went by and the war went on, household furniture perished in the using and had to be replaced. Worn-out carpets saw themselves renewed in-pretty colors and patterns, as bright and serviceable though not so handsome as Wilton. They came from the busy loom rooms with restored capacity to keep out the cold and deaden the clatter of the little wooden bottom shoes. Cozy rugs were made of the most unexpected materials, such as old shawls, flannel petticoats, stockings the heels and toes of which had forsaken them, and the like. Curtains of quaint stripes and figures, woven of stuffs from similar sources,

shut out the winds of winter, and gave comfort and beauty to the rooms. Broken chairs and decrepit sofas were replaced with others constructed of homespun cloth and cotton stuffing upon frames of wood roughly put together, or fashioned entirely of broom straw from the old fields, bound together in ornamental shapes with hickory withes. Sometimes interlaced grapevines made a pretty and not uncomfortable chair or sofa; and the common wooden frames, bottomed with twisted shucks or oak splints, abounded everywhere.

Many persons had their glass and china ware destroyed during the war; and it was almost impossible to replace it, even at ruinous prices. Such articles were always eagerly sought for at auction sales, and he who came determined to purchase must needs have a plethoric purse. Porcelain and earthenware of a coarse kind were manufactured from kaolin found in the Valley of Virginia and at other points in the South.

In their many exigencies and narrow straits the people of the Confederacy were nowhere put to a more crucial test than in the matter of lights. In the cities, gas, the fumes of which were as offensive to the olfactories as its radiating power to the eye, afforded a wretched pretense of illumination. In the country, where even the miserable gas was not to be had, the makeshifts to supply light were many. There was but little coal-oil in the South, and as little sperm-oil; and the tallow of the country went in large measure to the armies for military purposes.

A favorite lamp, and one easily fitted up, was a saucer of lard with a dry sycamore ball floating in the midst of it. A blaze applied to the sycamore ball readily ignited it; and it burned with a feeble, sickly glare until its sea of lard disappeared and left it no longer a fiery island. In the recipes printed in the current newspapers setting forth the proper manner of preparing the sycamore balls for use as candles, special insistence is made that they are to be "gathered from the tree and dried in the sun." If allowed to become over-ripe and fall to the ground before use, their fibrous covering would lose its hold upon the core, and drop away into the lard.

In the slave-quarters, "fat" pine knots blazed upon the hearth through winter and summer nights alike; while the night scenes of the negroes' merry-makings in the open air were illuminated by means either of the same material, or of crude tar piled upon the bowls of broken plantation shovels, set high in the midst on tripods made of three-limbed saplings. The juba-dance and the corn-shucking were equally invested with elements of the unreal and the grotesque, where the flickering

and shifting lights of the unconventional lanterns touched the dusky faces and forms and the smoke of their strange altars rose over them.

Another light in great vogue was the "Confederate," or "endless," candle. It was constructed by dipping a wick in melted wax and resin and wrapping it around a stick, one end of the wick being passed through a wire loop fastened to the end of the stick. The wick burned freely when lighted, but the illumination was very feeble; and unless the candle was watched, and the wick drawn through the loop and trimmed every few minutes, the whole affair was soon aflame. A great advantage of the Confederate candle was the length of time which it would last, its duration, when properly attended, being commensurate with the length of its wick and stick.

By the light of the sycamore ball or of the endless candle thousands throughout the South pored over the news columns of the papers at night to learn how went the battle, or scanned the lists of the wounded and the dead with eyes that ached with their hearts.

At no season of the year did the hard times draw so bitterly near the hearts of the adults as when the little homespun stockings hung about the chimney-place at Christmas, to await the coming of Santa Claus "through the lines." If he did not always bring bounteous profusion of gifts, the innocent fiction of his having been robbed by the armies on his way from the country of sleds and reindeers found many ready little believers, who, taking it for truth, yet did not really know how much of truth there was in it. To the younger children, who had no personal knowledge of the existence of many of the things that made the Christmas times so attractive to their elder brothers and sisters, the season was not so forlorn and pathetic as it often seemed to those who would have done so much for them and yet could do so little. Nor did they comprehend, if perchance they ever saw, the tears that oftentimes crept into unwilling eyes at the severe leanness of the little Christmas stocking, and the poverty that constituted its chief ingredient. Peanuts, known in the vernacular as "goobers," both raw and parched, pop-corn in balls and pop-corn in the ear, Florida oranges, apples, molasses cakes and molasses candy made up the list of confectionery dainties for the young people at that season. There were few of the many thousands of children living in the South when the war ended who had ever seen, even in a store window, a lump of white sugar or a striped stick of peppermint candy. The sorghum cakes of the hard times took the shapes of soldiers with im-

possible legs and arms, waving equally impossible banners; there were also guns, swords, pistols, horses with wonderful riders, and a multitude of curious animals not to be found described in any natural history then or now extant. So the molasses candy of the period was fashioned into baskets, hats, dolls, and manifold kinds of figures. Jumping-jacks, or "supple sawneys," were made of pasteboard, and worked their arms and legs through the medium of a cotton string. Rag doll-babies with eyes, noses, and mouths of ink were in great favor in the absence of those of wax or china; while here and there was the ever-welcome Noah's Ark with its menagerie of animals and its crew of men and women, all curiously carved out of pine-bark. Indestructible linen books for the little ones were made of pieces of cotton-cloth stitched together, on which were pasted pictures cut from old illustrated papers and magazines. Knitted gloves, suspenders, comforters, wristlets, and the like filled up the measure of the Christmas gifts.

Yet none the less gayly for the privation and distress standing so near at hand did the girls of that era trip it in the dances of the Christmas-tide with their brave soldier partners whenever opportunity offered; and none the less beautifully for the hard times did the red holly-berries of the season show from their waxen green, or the mistletoe hang overhead, in the light of the endless candles. For the

young women of the South, full of vim and life and spirit, the period of the war was in many respects a happy one. The girls and their lovers danced, as the soldiers fought, with all their might, and enjoyed it while it lasted. But with them, as with their elders, sorrows crowded on each other's heels, and the bride of yesterday was often the widow of to-day. They affected military dress, and wore brass buttons and epaulets whenever attainable. The demands of society upon them made sad havoc with many relics of earlier days which had been religiously preserved up to that time. The chests of every garret were ransacked; and morocco shoes and satin slippers of a by-gone generation, that had never tripped a livelier measure than a minuet, were held a veritable treasure-trove, and were dragged forth and danced in merrily. Many a lassie at the military "hops" showed her white arms and shoulders above the moth-eaten velvets and time-stained silks that had been worn by her young-lady grandmother.

Out of sight and hearing the hard times in the Confederacy have vanished. The recollection of them is attuned to melancholy; there is many a touch of bitter sorrow and of sharp regret in the strain; but the lapse of years has softened the once familiar air until the minor notes of joy are eloquent amidst the chords of grief.

A. C. Gordon.

THE MOUNTAINEERS ABOUT MONTEAGLE.

AMONG the first signs that the exhausted and poverty-stricken South of 1866 was neither dead nor paralyzed were her attempts to utilize certain natural resources, little valued or considered in the old easy-going ante-bellum days. One of the early movers along this line was a Tennessee company that opened some coal mines in the neighborhood of Monteagle, and then stretched up a daring arm from the Nashville and Chattanooga Railway, skirting the mountain's base, to their possessions on its summit. Then came the announcement that a house for summer boarders was opened near the arm's terminus.

Responding to this challenge, our party left the Nashville and Chattanooga Railway at Cowan, and from its primitive ticket-office followed a sooty train-man down the track, past several long coal-trains and into a queer

little box of a car, that had, however, its cushioned seats, its polite conductor (not yet visible), its painted tin cooler with the refreshing liquid ice-water, and its nickel-plated cup safely chained — all in grimy completeness.

Two passengers already were sharing these accommodations. One was a big-jointed, long-featured, shrewd-eyed, middle-aged man, dressed in a new suit of blue homespun, while his grave face and iron-gray hair were queerly surmounted by a small parti-colored straw hat — one of the sort oftener seen abloom on the head of some future sovereign, where its pristine freshness is wont to mark such high festivals as "the day of the big show."

On the opposite side of the aisle a small "pyeart" old lady in a brown and white calico dress, and with a large white kerchief folded about her shoulders and crossed over her bosom, sat with bared gray head by an open window.

Before we had had time to choose our seats

after the shift-for-yourself fashion of travelers, our old lady had assumed the duties of hostess and was receiving us with a cordial hospitality the like of which, I venture to say, never before had been seen in a railway car.

"Yes, thes take a seat an' set down onter this yer settle—lemme bresh off the sut an' truck, ur 't 'u'd smudge yer frock. Hit 's sorter shaddery an' cool on this side er the kyar, an' a little wind a-stirrin'. Now yer perlissee an' yer redicule ken go right up hyer, yer bonnet too, ef yer a mind ter go 'thout'n hit whilse yer a-ridin'."

Her own black splint sun-bonnet hung from a hook above her seat, a striped shawl carefully rolled in a brown paper and tied with a white cotton string lay in the rack, and on the seat beside her was a curiously braided home-made basket.

"An' you—all back there—ken retch up an' fix yoren thes the same, right 'bove yer own heads. Mighty handy they 're got it fixed off—all 'round too. Lige Tait, ez used ter work fer us an' now 's got hired ter help steer the kyars,—thes a-haftin' ter watch out, an' ter run backurds an' foruds on top, a-screwin' one ur nuther place down tight, soster hol' the wheels percizely onter their tracks,—he was a-showin' me all 'bout'n the 'rangements whilse I wair a-riden' down in this yer kyar lais week."

"Ah, then you live on this mountain. I 'm glad we have met you; because we are going to spend a little time up there. If this has been your first visit to the lower country, you must have found it interesting."

"An' so it have been, real excitin'; what with some ur nuther new piece er quar-ness, a everlastin'y a-comin' jam up agyins the one thes ahead'n it, an' the nex' a-jamin' agyins me both afore airy one could skeeter out 'n the way, so 't my min' 's in consider'ble er a jumble.

"Yes, I 've ended up my visit an' air now sot out on my back trip torge home. An' Square Cash there, a neighbor er our'n, ez wus a-goin' ter go an' take a journey down ter Winchester ter mind aiter some er his business, an' which bein' 't I had n't got no man-pyerson ter carry me home, he thes promust ez he 'd make out ter be ready agyins I wair, an' 'u'd inshore ter be in time before the kyars wus ter start, bein' a-aimin' ter ride back inside the kyar hisself. Square Cash knows all 'bout'n the kyars, an' 's a monstrous handy pyerson ter be along er."

But by this time 'Squire Cash hardly needed these commendations. The friendliness of his long arms and large hands in reaching racks, adjusting seats, and shading windows had convinced our young ladies that he was indeed

a handy person to be along with; and a half-concealed twinkling of his gray eyes suggested that he might be an entertaining one besides.

"You look some like yer head mout be a threat'nin' ter go an' set in fer a regler throbbin'," said this born hostess, as I leaned my head back and shut my eyes. "Lemme wet yer hankerch an' put thes a driber sampfire—"

"Oh, no, thank you. I 'm not suffering—only a little tired."

"Well, I hyearn some valley folks a-goin' on mightily 'bout'n the mounting a-bein' a prime place fer restin'. I could n't skasely make out in my mind how folks 't did n't never haff ter do no scutlin' roun' a-yearnin' a livelihood—on 'count er bein' ez rich ez pine—could naiterly be so dreadful bad off fer a rest. But aiter stewin' roun' in that swulterin' valley fer nigh onter a week—lettin' alone fer a whole in-dyo-rin', livelong lifetime—I feel ez slimpsy ez a dish-rag. An' I hain't been a-doin' a smidgen er work, ur airy formed thing ez orter, in reason, ter tire a body; 'lessen you 'd count a little fiddlin' 'roun, aiter the victuals wus all done cooked an' et up, a-reddin' up the dishes; ur else a-blairin' er my eyes at quar sights an' amazin' er my noggins at quar doin's."

Some one suggested that she would enjoy getting back to the mountain and having a good rest.

"That 's percizely what I 'm 'lowin' ter do, ef loppin' down an' lollin' 'roun makes restin'. But I wair thes a-studyin' ter myself, Mis'—Mis'— Now, don't hit 'pyear ruther onhandy not a-knowin' no names ter call one nuther by? Mine air Mis' Larkins, Aint Bashiby Larkins, folks mostly saiz."

Here, as I am glad to remember, my sense of courtesy prompted me to give, in addition to my own, the full name of every member of our party, with some short explanatory paragraphs, biographic and historical, attached to each. These recitals called out, now and then, equally interesting items in regard to numerous friends and kinsfolk of her own.

By the time that interchange of civilities was concluded and the various bags and bundles of our party had finally settled themselves into their several "handy places," and poor little Thad, after having been hustled out of three seats and fidgeting himself out of three others, at last had got his small person satisfactorily deposited beside 'Squire Cash, our train began to move. Almost immediately we found ourselves ascending the mountain—our little car clinging to a long empty coal-train that, in its turn, held fast to the puffing, straining locomotive as, far before and above us, it climbed a zigzag track up the mountain's side. The sight was a novel one even to those

of our number who repeatedly had crossed by railway the Sierra Nevada and the Rocky Mountains, giving, as all felt, a startlingly distinct impression of *climbing*. In fact, as we watched the locomotive, first from this side and then from that, now recklessly clattering along the brow of a precipice far up to the left, and now away off to the right fairly crouching for the spring to another height, it hardly seemed to belong to the tame lowland species suited to smooth ground and a level track. It was easier to fancy it some fierce gigantic savage, as well fitted out for life in the mountain wilds as any other "varmint."

But we had not a monopoly of that sentiment, as we soon learned.

Mrs. Larkins was now sitting a little apart from any of us but near to 'Squire Cash, and as we slowed up at a water-tank we heard her voice above the lessening noise.

"I 'd never 'a' drump hit, afore I seen an' hearn it 'ith my own eyes an' yers, ez anything 't ain't a livin', knowin' creetur could 'a' clum the mounting like that air engine do. Yer see hit a-staivin' 'long, 'thout nuther horn nur huff, a-pullin' an' a-catecornerin' this yer ways an' yander ways, so powifol knowin' 'bout'n all the steep places, hit thes puts me in mind er Uncle Peter Beans's idy —'lowin' 't ef they warn't a live, livin' varmint shet up insides, 't wuz ez plain ter be seed ez a Jack-ilantern 'n a dark night 'at the Ole Nick hisself hed tinkered up the paturm — I reckon you hearn 'bout'n hit, Square Cash?"

"Yes, I heyard 'em a-tellin' er it. I ginerly listen at any jawin' 'bout what Uncle Peter Beans has been a-sayin'; purty cute notions now an' agyin comes out er that quar ole head er his'n."

"Oh, please tell us about it — about him and what it was that he said about the locomotive," pleaded a listener.

"Well, I don't reckon 't 'u'd be skeersly time ter mighty little more 'n interjuce 'im, so ter speak, tell the train 'll start on, 'thout hit 's hendered longer 'n common," he replied.

"An' yer cain't hear yer own yers then, 'th all the hills a-boundin' er the noises all back-urds an' ever' which ways through other, like they keep a-doin'," said Mrs. Larkins. And she added, "Hit 's rather agravatin' a-haftin' ter shet up an' be outdone that away."

But 'Squire Cash, like other good talkers, evidently appreciated an interested audience.

"Anyways," said he, "I 'm a good mind ter set in an' tell you ladies some little 'bout 'm, an' then some day ef ary y' all 'u'd jes rec-ullec' ter put Aint Bashiby en mind er 'im she 'd be up ter tellin' a heap more."

"Yes," Mrs. Larkins agreed, "I 'll be roun' ever' wonst an' awhile ter whur y' all ul be a-

boardin' out, at a-tradin' off my butter 'n' aiggs, an' liker 'n not we 'll fall in 'long er one nuther agyin 'n' agyin."

"Ter start on," began 'Squire Cash, as he lifted his little patchwork-pattern hat from its incongruous perch and reaching down carefully balanced it on some rusty saddle-bags at his feet — "ter start on, I reckon 't Uncle Peter Beans is some different frum anybody 't you all ever seen. He lives on the fur side er this yer rainge in a little cove, purty well shet in all roun', whur they say the Beanses hes lived ever sence the Revolution — 't any rate, it's named Beans's Cove; an' only three ur four more families lives in it. They don't neighbor much with nobody besige theirselves, — bein' so shet in like, — an' they say some er the women, an' even middlin'-sized boys, hain't never been nowhurs outsidess."

"Raise their children, boys and all, shut up there that way for years an' years," interjected Thad, in a tone of deep disgust — "make them go to some little snippy sort of a Sunday-sch —"

"If they have really found a way to keep boys shut up they can make a fortune on the patent," came in a sharp treble voice from the third seat back.

But Thad's lucky head was proof against all such pop-gun missiles as that; it hardly checked his comment. I have not taxed the reader with a description of our prosaic party of "women folks"; but I have a mind to risk half a dozen lines on Thad. Not that he was in any sense a peculiar specimen of the budding American sovereign, but because — well, because he was *Thad*; and, like most other young animals, was an interesting object to watch, though not always a convenient one to have around. And a vigorous, thriving, natural young animal he was too; with, moreover, some embryonic human traits of a not unkindly sort. But his one point of distinction was his good-humor; a certain sturdy, equable, self-sufficient, and apparently self-generating buoyancy that forty times a day I looked to see collapse, and forty times a day saw rebound without the sign of a puncture. Beneficent Nature had given him a good, thick, snub-proof cuticle that (as there is scientific warrant for stating) she had specially hardened up to suit the exigencies of his environment. Perhaps it should be added that the word *environment* is intended here to refer to a family of critical older sisters who — ah, I had forgotten — who are not to be thrust upon the reader's attention, and therefore need not be described.

But to return to Thad. As I afterward found out, he had stowed away somewhere in his round head — that, like his pockets, was

an unassorted museum of queer odds and ends—a pretty correct idea of a *cave*; and at the word *cave*, that dark apparition had popped up like a Jack from his box, to symbolize before Thad's mental vision Uncle Peter Beans's place of abode—the place where they "kept boys shut up, year in and year out."

I caught only enough of his last sentence to infer that it expressed no good opinion of a set of folks who chose to keep themselves, more particularly their boys, shut up so all their lives—"keeping up a snippy little Sunday-school and everything off to themselves inside their old cave-hole, rather than let the boys out even on Sundays."

'Squire Cash looked down at him a moment, apparently conscious that he was a little hazy as to the boy's point of view, and then replied at random, addressing the ladies rather than Thad:

"No, don't reckon they hold no meetin's in the Cove, none er 'em a-bein' exhorters ur class-leaders. But the circuit-rider holds his 'p'intment jes a few miles roun' the knob, ginerly ever' four weeks; an' some er the young folks goes, pertickler when the big two-days' time comes roun'. The ole folks hain't never tuck much ter meetin'-goin'; but that's nuther here nur there, ez ter techin' on the story I 'm a-aimin' at.

"Ez fer Uncle Peter though, he's 'mazin' fond er seein' an' hearin' what-all's goin' on roun' the mount'n—jes kinder collectin' up the news an' a-sortin' it out fer the use er his settlement. Off he puts thes a-ways ur thet a-ways, whurever anythin' 's happened, an' picks out the identical fax on it, 'cordin' ter *his* judgment, an' wraps 'em up inter a snug little budget, so ter speak, an' goes a-toatin' er 'em back ter Beans's Cove, bent on makin' shore't the Cove folks gits the raal truck ur none 't all. 'Lows thet 's what he's spared ter 'em fer, jes ter watch out 'n they hain't befooled inter swallerin' no lies.

"Fer a good long while now he's been the oldest man-pyerson in the Cove, an' he 'lows 't the folks jest naiterly believes what he tells 'em ter an' shets their yers at all the rest. 'T ain't percizely that away, but the Cove folks thinks a consider'ble chance er Uncle Peter, an' never out 'n' out contends against his judgment.

"Well, now, when the word was fust tuck ter Beans's Cove 'bout what a' onaccountable, rampagin' cunsarn the company hed gone an' brung ter the mount'n, ez Ainse Hawes saiz, Uncle Peter wus in a powiful pucker—'lowin' 'at Jim Counts, ez hed brung the word, wus everlaistin'y a-hatchin' up somepin out 'n nothin'; leastwise a-gettin' er it hine end for-must ur wrong sides outurds, so's 't 'u'd naiterly

look quar, ef not skyeery. Not ez he reckoned 't Jim Counts p'intedly laid off ter tell sich whoppers; like's not he 'd fooled himself; liker too, that cimlin head er his'n a-bein' nigh er about ez green ez a gourd."

"Pretty rough on Jim Counts—like callin' 'im a fool was the best could be—"

"Now, Thad, there you go again. I'll give you a quarter to hold your tongue till we get up the mountain." And a second voice added, "Seen and not heard is the word for you, youngster. Please go on, 'Squire Cash."

"But Uncle Peter," continued 'Squire Cash, as he handed Thad a stout stick of striped candy and returned the parcel—a bulky one, some eight inches long—to the outside pocket of his blue coat; "but Uncle Peter 'lowed hit mout 'a' been wuss. S'posin' this wus week afore lais, an' his right knee ez stiff ez still-yurds, an' nigh 'n' about a-threat'nin' ter come onjinted ever' time 't wus teched, on account er that rumatiz ring roun' the moon; stidder like hit wus now, an' ever' laist one er 'em dependin' an' a-restin' easy beca'se they jedged an', in a manner, know'd 't he 'd naiterly concluded ter up an' go an' git a holt er the straight 'n it hisself.

"Fur hit warn't in reason 'at he wus a-goin' ter go an' set roun' on his lunches and see the Cove fairly et up alive wi' the ondaciousest pack er lies ez hed ever been let loose onter 'em. He'd treed a middlin' good chance er that sort er varmint in his day an' time; an' he reckoned he 'd haf ter keep on a-trackin' 'em up an' a-reddin' 'em out ez long ez his ole laigs could waiggle. He 'd let that smarty gang ez hed befooled Jim Counts know't the Cove hed ginerly been counted ez a-hafin' in a head ur so 'mong's 'em 't wus some better 'n a fros-bit cimlin; an' 'at the whole settlement did n't set roun' 'ith their mouth a-hangin' open, bent on swallerin' ever'thin' 't wus dropped inter 'em. But he hoped in the name er common sense 't aiter this Jim Counts 'u'd thes set in an' lay hisself out ter naiterly harden up that sap-head er his'n, so 's never aygin whilse the yeth stands still, ter git hisself inter airy nuther sech a flounder.

"So, nex' mornin', long 'nough afore crowin' time, up he bounces an' 'thout a-waitin' fer nuthin' but a swig er coffee—an' Aint Prindy had ter scuttle roun' middlin' pyeart less'n she would n't er got that b'iled in time—an' a-swallerin' er one cold snack an' a-puttin' unuther 'n inter 'is pocket, out he puts fer the mines."

"Must 'ave been a pretty long ride. I wonder how far," began Thad.

"Oh, bother, we can hear you when we can't hear anything else! No, don't answer him, Mrs. Larkins; papa says every answer

you throw to Thad just knocks down half a dozen more questions." But Mrs. Larkins, leaning over towards Thad, was saying, "I was a walk stidder a ride, sonny. An' how fur 'u'd you count hit, Square Cash?"

"Well," said 'Squire Cash, leaning back in a deliberative attitude, "frum eleven miles ter a right smart upurds both there an' back, 'pendin' on which a-ways he 'd 'ave went. Now the direction 't Uncle Peter mostly takes, a-follerin' the reg'lar waggin track down roun' by the two Creelses, a-skyartin' 'long the aige er Owl's Holler, an' a-crossin' er the main park er Squaw Creek someurs 'bout the deer-lick, an' then a-b'arin' out — I don't kyeer how sharp nur how direck he 'd b'ar out, ter strike the big road 't runs all the way across clean ter Ailte-mount 't 'u'd be a monstrous good thirteen miles. But ef he had jes 'ave tuck a straight shoot foruds, an' right up across the knob, an' then 'a' slainted off a leetle north-way-like frum the p'int, toge Treasyer Cove, an' frum any-whurs long o' there ter the left er that ole b'ar-walker' 'a' struck a bee-line right spang through the Big Woods, an' on inter that snaigly strip ersorter mixed chestnut timber — likely a-need-in' ter lean out some little north-ways agyin jes here, so 's ter miss the jump-off 't the head er Deep Gulch, tell he 'd 'ave come out onter the mill-road sorter cateconerin' across frum the ole Damurus clearin' — why, 't would n't skursly 'a' been, lemme see," — then looking up at the top of the car with the air of one making a very nice calculation, — "'t would n't nohow 'a' been — hit *could n't* 'a' been — mighty little upurds er a bare elevin an' a half, nuther a-goin' nur a-comin'.

"But Uncle Peter 'lows 't when he's got the day ahead er 'm he don't mind a few miles more ur less. An' the nigh cut a-bein' ruther lonesome wi' no paissin' nur repaissin', he 'd ruther take his time, an' a mighty good chance ter strike up 'long er someun wonst an' awhile on the big road — hit mout be a stranger all the way from Pelham ur Ailte-mount. An' then a-comin' home he can drap in on Granny Creels, an' may-be take a cheer an' draw up fer a sup er Miss Peniny's coffee.

"Well, now, that night aiter the mornin' ez he 'd struck out fer the mines, 'long betwixt roostin' time an' candle lightin', when 't was most time fer him ter be a-showin' 'isself, Ainse Hawes an' Jim Counts tuck it onter themselves ter be a-startin' out a coon-huntin' 'long the waigin road 't he 'd be a-comin' by. An' what with foolin' 'long at a slow sainter, an' a-restin' ever' wonst an' awhile, they hed n't got fur tell they seen 'im a-comin'. An' ez soon ez they 'd got up nigh 'nough apart ter make out 'is looks they knowed 't he was might'ly out er kilter — a-blairin' straight

ahead'n him ez vig'rous ez a wild-cat, an' that crabbed 'at he 'd skursly let on ter nodis 'em aiter they 'd up an' told him good-evenin' jes ez swiftly an' respectin' ez they knowed how. But they tagged 'long aiter 'im, a-makin' out ez how they 'd foun' the night was too dark fer huntin', an' ez they 'd done tuck the back track afore he come along.

"Then aiter a while they venterd ter sidle up besige 'im an' ter 'low ter 'im how 't the Cove folks was all a-stewin', not to say a fairly a-sizzlin', ter hear what was his concludin's 'bout that air fool cunsarn ez the company hed hatched up — ef 't was wuth talkin' 'bout.

"Then Jim Counts says he jes' flew all ter flinders. 'Lowed he 'd never laid off ter have no kunjurin's nur kulloquin's hisself, a-lettin' alone ez ter out 'n out dealin's an' compax; an' he hed n't no call yit ter go ter mommuckin' up his brains 'bout'n them ez hed — nuther their works. But he jedged they mout 'a' kivered up their tracks (which he mout thes ez well say horns an' huffs) better 'n they hed done, ef they 'd made out ter 'a' used a few grains more sense; — ef they hed 'ave says 't wair some vig'rous varmint ez they 'd got shet up insides, a-doin' er the pullin', same ez the puffin' an' the bellerin', hed 'a' been a sensible lie. An' he hoped fer the gracious sakes they war n't airy naiterl born simple nowhurs roun' Beanses Cove ez 'u'd go ter makin' a pesterment fer theirselves 'bout'n a' onhuman cuntrivance, which he 'd resk goin' so fur ez ter jedge ez nairy single mortrel creetur ez hain't a mind ter sell out baig an' baiggin won't never see through the inerds on it — not ef they wear theirselves ter solid frazzles a-tryin'.

"Someurs 'long 'bouts here Uncle Peter stumpt 'is toes agyins one er them snaigly little saissafra sprouts, an' keeled over inter the gully. An' by the time the boys 'd got 'im hauled out an' onter 'is feet, an' the begaumin's er the mud scraped off — you see it was sorter'n a loblolly at the bottom er that gully — he 'd 'a' cooled off a cunsider'ble, an' likely begun ter skyeer hisself, less'n longer furgittin' ter be kyeerful in 'is goin's on he mout 'ave went a leetle too fur. An' so up an' at it he goes ter work a-smoothin' it up sorter this a-ways.

"Says ze, 'Not ez I wuz uther a-saissin' ur a-floutin' ur a-bemeanin' at anybody which hit's a part er their reg'lar business, 'long er bein' onhuman thei'self an' naiterly a-havin' a'onhuman sort er sense.

"'Pintedly,' says ze, 'I hain't got nothin' agyin *him*, an' I don't aim ter never say nothin' agyin 'im; an' ef ever he wus ter go an' git riled up ter come a-slashin' agyins me, like ez how 't he blieved he owed me a spite, 't 'u'd be on the a'count er a misunderstanding' 'bout'n who I was a-aimin' at.'

Here a brakeman came up to speak with 'Squire Cash; but Mrs. Larkins chinked up the opening made by this break in the story to good advantage.

She said, "Uncle Peter is powiful skyeery 'bout gittin' the Ole Un sot agyins 'im, an' takes a heap er pains, mostly, ter keep on the good side er 'im; stidder blamin' er meannesses onter him ur a-callin' 'im by bad names sich ez Ole Harry, Ole Scratch, an' the like ez 'u'd gyin him a spite."

"'An' what's more,'" said 'Squire Cash, going on with his quotation from Uncle Peter,—"What's more, 't ain't in reason ez anybody orter blame 'im fer his dealin's 'long er them ez banterers 'im ter trade that away."

"'But hit 's a 'mazin' mean trick er them banterers; aiter he's went an' made a' up-an'-down square bargain with 'em, an' a-goin' right straight 'long in 'is dealin's, he's went on ter fix up a' onaccountable cuntrivance fer 'em,—leastwise he's tinkered up all hits main p'int,—an' then they thes ups an' goes ter flairin' er theirselves all over the top side er creation, a-paradin' roun' an' a-showin' off the cunsarn, an' actilly a-goin' so fur ez ter p'intedly claim the credit on it; a lettin' on like 't they thes naiterly studied it all up theirselves an' hatched the whole cunsarn bodacious out'n the insides er their own heads."

"'Well, I was deturmd ter not go ter startin' up no jowerin's 'long er 'em, which they 'd 'a' bin the whole tribe ter 'a' j'ined in on me, besige er havin' er their dealin's an' their compax ter back 'em up. But 'thout a-purtendin' ur a-lettin' on ter counterdick 'em, I thes up an' 'lowed ter the feller ez hed done the main chance er the praincin' roun', how 't them all was mighty fine p'int's fer showin' off an' like's not they growed naiterl ez chinkipins whur that cuntrivance was hatched up, but how ez I 'd hyearn tell 't outsiders had ter do some monsturs tall tradin' afore they 'd git a holt er 'em."

"'What sorter p'int's you a-meanin'?" sez ze.

"'Now ef I had n't 'ave kep' a' oncommon gripe onter ever' lais one er my seven senses I 'd 'a' actilly 'a' b'ilt over at 'is imperdence — a-upin' an' a-aixin' er me what sorter p'int's I was a-meanin', right spang in the face er that air 'dacious piece er quarness, a-tearin' up the very yeth 'ith its fire an' its smoke an' its bellerin's, an' its stavin' 'long 'ith the wheels all a-whirlin' 'thout nuthin' a-pullin' nur nuthin' a-pushin', an' that air one termenjus quar-lookin' eye a-stairin' straight ahead, an' which them ez hes seed hit fer theirselves ull swor' afore the magister how ez hit ups an' blazes out like the moon afire ever' dark night."

"'But you all take nodis now who I 'm a-

lettin' out at. Ez I was a-sayin', I don't aim no saissin's nur floutin's nur bemeanin's at the one ez orter git the credit er the job. An' which I 'm a-layin' off ter allus stand up p'intedly fer 'im, bein' 't he hain't never done me no harm an' I hain't never knowed him ter meddle 'ith nobody ez did n't fust meddle 'ith him — uther a-banterin' ur a-agravatin' er him."

"'Now, don't you ladies say 't Uncle Peter's got a right cute ole head er his own, an' watches out middlin' sharp? Some ruther makes fun er 'is doctrine techin' the Ole Scratch an' 'is works, but fer all that hit's a doctrine ez hes some mighty good p'int's," concluded 'Squire Cash with immovable gravity of features as he went toward the door, "a-bein' fer one thing powiful handy 'bout gittin' roun' pesterments. Why, it styeers Uncle Peter clean apaisa a whole raift-load er de-fic-ulties ez a plenty er folks flounders at."

"'How? Please tell" — But by this time he was out, and soon we saw him taking long strides up the curving track on which stood our train, while Thad's short legs close behind "had to waggle themselves like everything," as he afterward expressed it. Some one suggested that they might be left, that it must be about time for our train to start.

"'No, I don't reckon it can start on yit awhile," replied Mrs. Larkins. "Lige Tait was a-tellin' Square Cash how 't somekyars ahead'n us hed got off'n their tracks, an' he counted 't 'u'd be a right smart while afore our'n could budge."

After a while one of our party expressed the belief that 'Squire Cash had been playing on our credulity, that he had made up that whole story as he went, and appealed to Mrs. Larkins: "Do you think Uncle Peter Beans or anybody else believed such things?"

"'Tubbe shore, tubbe shore," said she; "some does. A men-yer and a men-yer one is sorter skittish an' skyeery like 'bout'n haints an' signs an' so on. But mighty few has it all studied up an' fixed out reg'lar in their minds like Uncle Peter does." Then, in a very gentle and dispassionate but mildly argumentative tone she added:

"'But hit 'pears ter me, hit shorely 'pears ter me, ef I wair a-goin' ter haf ter go an' swaller any sich doctrun, I'd ruther take it all strung tergether in Uncle Peter's way, so 's 't 'u'd look some like sense, ur leastwise like hit aimed ter be sense, nur thes ter take up wi' snips an' patches er quarness which even Uncle Peter hissself would n't pertend ez they hed a grain er sense ur reason ter 'em — like a-bein' skyeered at a rabbit a-crossin' yer track, ur afyerd ter eat if they happens ter be thirteen, an' a-das-entin' ter begin no jobs on Friday, an' a 'lowin' 't which away they see the moon over one ur

UNCLE PETER BEANS.

er t' other shoulder ull have a heap ter do 'long which an' t' other a-happnin' that month. But lawsy ter massy, yer mout thes ez well argy at the man in the moon, 'gyinst sailin' roun' nights, ez ter waste yer breath on them ez takes up er sich notions.

"I hain't a-pes't'rin' my noggin nuthin' much 'bout'n 'em; they ken swaller hit in snips an' patches, ef they 'd ruther, fer all er me.

"An' Uncle Peter, he ken count ez they thes got the main p'int er that air engine 'long er their kulloquin's; ur he ken hold ez 't wair out 'n' out tradin' an' a-signin' over er themselves ez bought hit all done tinkered up an' topped off,—primed an' triggered fer a-runnin' up hill ur down,—ur them ez wants ter ken 'low 't they 's a vig'rous varmint shet up insides, an' they won't none er 'em git up no jowerin's 'long er me.

"I 'll thes go 's fur ez ter say, ef 't ain't a-livin' an' a-knowin', hit 's shorely a-bein' an' a-doin', like that valley school-keepin' woman has it in her rigmarole over 'n' over agyin. An' hit 's bein' an' doin' suits me middlin' well, 's 'long

ez it 's a-hisetin' we all out'n that air br'ilin' valley. Blazes, jes ter think er all them nigger folks a-slatherin' roun' through the sun, an' the sweat a fairly sizzlin' out'n 'em, an' that mop er swung wool atop er their heads—you 'd 'a' thought they was naiterly boun' ter swulter. But they kep' ez pycart ez crickets, a laughin' an' a-jawin' ter one nuther like they felt ez cool ez a kercumber. Quar, though, ter see their heads all swung up thet away 'thout a-bein' burnt so 's ter blister."

"I don't understand about their being singed," said I, with vague thoughts of an accident floating through my brain. But in another half-minute these had given place to an idea that proved to be nearer the truth.

"Had you not seen negroes before, Mrs. Larkins, and don't you know their hair is naturally different from ours—woolly?"

"Yes, I 'd hyearn how 't their heads was kivered with wool 'stidder raal hair. But what I tuck pertickler nodis at, wus it all a-bein' scorched inter crisps, like evum black wool would n't naiterly be. Did n't you all see none er

their heads 't showed ez they 'd been swung sense the hot weather come on?"

"No, we did n't think of such a thing."

"Well, 't looked quar. But now I mind how dreadful quick any yarn truck ull ketch a scorch,—'nough sight quicker 'n cotton ur flax, airy one,—'t ain't no wonder 't their heads 'u'd be more ur less swung. Some er 'em wus a heap sight wuss 'n yuthers. Two ur three boys 't I seed hed got sich a scorchin'—may be longer bein' kyeerless an' goin' 'thout'n their hats over 'n' over agyin—'t was swung clear down ter the roots, an' that bricky 't nigh 'n' about ever' laist smidgen on it wus breshed off tell their heads wus positive naked, 'less'n thes now an' agyin little sindery streaks an' spots lef'. Looked some like an ole field aiter hit 's been blazed over in a dry spell; which y' all know how 't 'u'd be mostly all burnt off plum down ter the yeth, and thes wonst an' awhile little black patches er scorched up stubble a-showin'."

At last I remembered having seen heads that looked just that way; and I was almost

afraid of seeming stupid in not having thought of the sun's shining them as the cause.

"There they come—yes, that 's 'Squire Cash leading the way; and there 's Thad at his heels. Of course Thad kept within question range. Now our train 'll start."

"Well," commented Mrs. Larkins, "hit 's time, I judge. No, my patience ain't wore out, but hit 's a-beginnin' ter frey roun' the aiges. I never staid away from home but two nights hand runnin' afore; an' now 't I 've been a-jaintin' better 'n a week, I feel tolible keen ter git back. Besige, I 'd like the smell er some coffee."

"We might have got a cup of coffee at Cowan, if we had thought of being detained," said I.

"Well, fer my part I thes ez leve 'a' waited ez er drunk any er their'n—liver, too, I allow. Nuthin' 'u'd do Lige Tait ez soon ez we got inter Cowan the day I rid down in this kyar, but he must put right out an' borry a cup an' saisser an' fetch me some coffee from the tavern. Flattish truck Lige said he 'lowed 't wair afore he brung hit, but I reckoned ter 'im they was different fashions fer coffee, an' like 's not them ez follered that 'n' 'u'd count our'n sorter out'n date. An' I forced down a cunsider'ble on it, 'long er my snack, aiter Lige 'd went on an' laid 't all off ter me, how 't I 'd haf ter thes set in an' set roun' the whole indyorin' day a-waitin' an' a-waitin' fer the carryall 't hauls folks backurds an' foruds ter Winchester, besige it a-bein' that ag'ravatin' ter be hendered so, an' 't I wair boun' ter be wore threadbare. But threadbare hain't no name fer it, Miss R——; I wair plum frazzled out. Hafin' ter work goes mighty agyins the grain sometimes, but 'tain't a circumstance ter hafin' ter do nothin'. Hit 's a positive fac', I 'd a-gyin a purty fer evum a little knittin' ter piddle at."

"Well, I reckon y' all are jest about tired out, but we 'll get off dreckly now," said 'Squire Cash, coming in.

One of our young ladies reminded him that he had treated us rather badly in breaking off just where he did—that if Uncle Peter's way was such a good one, we wanted to hear its advantages explained.

"Lemme see now; whurabouts was I? Why, yes, now I ricollect. I orter 'a' p'inted out the advantages, ef y' all don't see 'em a'ready. But 't won't take you ladies more 'n seven secunts ter see the sense er the main p'int ef you could wonst git a good look at it."

"Pore little creetur, he's all frazzled out," said Mrs. Larkins. "See how his head 's a-doddlin'."

Then it was a sight worth seeing when 'Squire Cash gently lowered Thad's limber-

necked head (with forehead drawn into a mimic frown and sunburnt nose thickly be-studded with small beads of perspiration) to a shawl-strap bundle and lifted his dusty, dangling little feet to the seat.

As he reseated himself on the other side of the aisle he began, "'T won't take you ladies more 'n seven secunts—" But the clatter of our train now in motion drowned his voice.

Talking, or rather hearing, being now impossible, all gave themselves up to enjoyment of the surrounding scene. In the shadowy solemnity of the mountain forest, the many colored wild-flowers, the long tendrils swaying from precipitous gray cliffs, even the clumps of azaleas here and there bursting into bloom, seemed, not gay, but tender and hallowed, like decorations in a cathedral.

As we rose higher and higher, now and then where the craggy cliffs receded a friendly opening in the forest permitted us to look far out across an illuminated sea of shimmering, silvery air that rolled in enchanted billows over all the lower world; or down through its blue-gray depths to where, pictured in miniature, lay the farms and hamlets, orchards and gardens, dark woods, and golden harvest fields of the wide-spreading valley. 'Squire Cash now had taken a stand on the platform. But Lige Tait (as we had come mentally to name our silent brakeman) signaled us to be on the lookout before coming to each of these openings. Then with the non-committal face and manner that are the common heritage of so many of his race, his pathetic eyes would watch our faces while we gazed. But he heard all comments and admiring explanations with a grave silence that seemed to say: "It is just as it always has been and always will be. It will do you good to see it, and you are welcome to the sight; but your praise is not needed."

As our car ran very slowly past the largest of these forest windows, and all silently drank in the wonderful beauty, Aunt Bashiby's strong face grew soft below the scanty gray hair that a breeze was slightly stirring, and after a long-drawn breath she said:

"Hit 's a beautiful sight to see. Don't look like they orter be anybody uther a-frettin' er theirselves ur a-bein' mean ter one nuther an' a-livin' in sich a world. An' the mounting shows grand from the valley too. I wish you could see hit, Miss R——, frum Clarinda's back door. Powiful diffurnt, tubbe shore; but 't 'u'd puzzle a body ter say 't airy one's better 'n t' other."

"Makes me think er folks, Aint Bashiby," said 'Squire Cash, taking his seat, "how they hain't obligated ter be all ezactly alike ur else they won't be the right sort, 'cordin' ter what

MR. CASH AND AUNT BASHIBY.

some 'pears ter reckon. Fur 's I ken see, I jedge they 's sever'l right sorts same ez they 's sever'l wrong sorts."

"Well," said Aunt Bashiby, after a pause, "I never studied 'bout'n hit that away afore; but they 's a heap er sorts er most ever'thin', animal creeters, an' varmints, an' trees, an' gyarden truck; an' one tree ur one creeter a-bein' one way, an' the nex' tree ur the nex' creeter thes t'other way, hain't no sorter sign 't airy one er 'em ain't percizely like hit orter be."

This mountain-top scenery is a curious mixture; wide forests, level as a prairie, and long, sloping hills that stretch out to the sun, being as characteristic of the region as are its beetling cliffs and craggy chasms. One can easily fancy these level forests and sunny slopes to be remnants of booty, captured in titanic maraudings from the quiet valley below—in that dim past of "far-off, wild, and lawless times, when tempting plunder did warrant pillage."

Now we are in the heart of one of these captured forests. In a solitude that seems primeval it stretches away on every hand, and— But our train is stopping; and I hear Mrs. Larkins saying, "Shore 'nough, Jimsy an' the naig 's a-waitin'."

Looking out we see a sedate little horse accoutered in an ancient side-saddle and bestrode by a small barefoot, shirt-sleeved laddie; the last descriptive compound being literal, so far as the little blue cotton shirt is allowed any visible part in the costume. That primary garment is suppressed, and territory belonging to the absent "wescut" overrun by a coalition of forces, some transversely striped "galluses" of surprising width having made common cause with the small, high-shouldered butternut trowsers for the conquest.

The setting sun is sending a few long, level shafts through the tree-tops as from our slowly moving train we watch them down a narrow road into the forest. 'Squire Cash is striding ahead and the solemn little "naig" circumspectly following, with Mrs. Larkins sitting very erect, while Jimsy's queer little figure is outlined on her back like an immense fancy buckle claspings the blue girdle of his arms about her waist.

As the quaint figures disappear, I try to picture the little homes with the peach-trees about them. But my imagination fails to evoke any sort of human habitation from the darkening depths of the forest.

SIDEREAL ASTRONOMY: OLD AND NEW.

II. THE RESULTS THAT IT HAS ATTAINED.

HEMISPHERE BOREAL

FLAMMARION'S CHART, SHOWING THE SECULAR MOVEMENTS OF THE STARS AND THE STELLAR SYSTEM OF THE NORTHERN HEMISPHERE. (FROM "ATLAS CÉLESTE," BY PERMISSION OF GAUTIER VILLIERS.)

IN the preceding article we collected the data which the ancient and the modern astronomy has placed at our disposition. We saw that a few hundred of the stars have their positions fixed with the last degree of precision; a few thousand are known nearly as well; half a million have their places approximately known, and half of these last are tolerably well determined. The brightness of some 10,000 stars is

well known, while the brightness of nearly half a million is known with fair approximation. The distances of a few stars (about fifteen) are known with precision; the distances of a few more are approximately known.

These are the data which have been amassed by the observing astronomers of the modern period, beginning with Bradley (1750). In the present paper we are to see some of the general conclusions which may be drawn from these data. What are the distances, what are

the dimensions, of the stars? What is the orbit in which our sun, with its group of planets, is traveling? What stars are our nearest neighbors and traveling with us? Are stars in general aggregated into systems of comparatively small size, or are the stars as a whole collected into one vast system, bound together by a common bond, and endowed with a common motion?

The stellar universe, as we see it at any moment, is quite complete. Change does not seem to belong to the region of fixed stars. Yet every one of the millions of observations has been made to fix a position so accurately that the slow changes which must be going on may not escape us; so that the laws of these changes can be formulated. If we know that a star retains its position invariably, if we know positively that its brightness and color remain the same, it becomes for these very reasons a most useful standard of reference, but it does not, as yet, help us to solve the problem of the stellar universe. We must seek a clue elsewhere, among the stars where changes are manifest, so that the unknown laws of these changes may be unfolded.

PROPER MOTIONS OF STARS.

As we said, nothing appears to be more invariable or unalterable than the region of the fixed stars, and, in a general sense, nothing is more so. But when we come to a closer view all is change there as well as elsewhere.

Since Rome was built the apparent situation of Sirius has changed more than a diameter of the moon, Arcturus has moved more than three such angular diameters, and so with other stars.

If gravitation is truly universal, if all the stars are bound together in one system by this law, as we believe, then no star can move without affecting every other. As one moves all must move. The real motion of any star is along some line or curve; we see this real motion projected on the ground of the heavens as an apparent change of its latitude and longitude. Knowing the latitude and longitude of the star now by observation, we may compare these with the positions of twenty, fifty, or a hundred years ago. It is possible to allow by calculation for every one of the complex changes produced in the apparent position of a star by every cause not in the star itself. Each one of the several observations, when so reduced to a common epoch, should give the same position, except for the small and unavoidable errors of observation and the proper motion of the stars.

For example, here are the observations made by Dr. Gould in the last twelve years on a

southern star, all reduced to what they would have been if made on January 1, 1875:

Year of Observation.	Right Ascension.	South Declination.
1873	23° 58' 0.92"	37° 58' 13.9"
1876	2.19"	20.9"
1881	4.63"	34.1"
1885	6.60"	42.0"

These do not agree. They ought not to differ by more than 0.20" or 3''* if the star were at rest. If we assume that the star is moving in right ascension by 0.482" and in declination by 2.45" yearly, and apply these numbers, the positions will harmonize.

1873 is two years before 1875, and we add twice 0.482" and twice 2.45"; and subtract for the other intervals. The observations thus corrected give

For 1873	23° 58' 1.88"	37° 58' 18.8"
1876	1.71"	18.4"
1881	1.73"	19.4"
1885	1.78"	17.5"

and are harmonious within the errors of observation. If we assume that this star is as near to the earth as the very nearest of all the stars, it is certainly moving no less than 600,000,000 miles per year. Yet it will require more than 3000 years for it to move from its present place by so much as one diameter of the moon.

The calculation that has been outlined here for one star has been performed for several thousands of the better known stars, especially for the 3222 stars which were most carefully determined by Bradley in 1750. For each one of these the proper motion has been determined with the greatest nicety. The results at first sight are interesting only in a very special way. No. 1, for example, may be moving 21" in a century along a path inclined by 10° to the equator. No. 2 moves 44" in a century along another path inclined by another angle, and so on to No. 3222. Here seem to be 3000 isolated facts, each one useful in its narrow relations, but each having no connection with any other.

Let us suppose for a moment that the sun, with the solar system, and the earth, our point of view, are moving onward in space, and imagine how such a motion would affect the appearance of a universe of stars scattered all about us. If the sun alone has a motion, all the stars towards which we are moving will appear to be retreating *en masse* from the point in the sky towards which our course is directed. The nearer stars will move most rapidly; those more distant, less so.

In the same way the stars from which we are retreating will appear to crowd together

* Errors of observation of this magnitude may exist.

and approach each other. It is as if one were riding on the rear of a railroad train and watching the rails over which one had just passed. As one recedes from any point the rails at that point seem to come nearer and nearer together. If we were passing through a forest we should see the trunks of the trees from which we were going apparently moving nearer and nearer to each other, while those at the sides would retain their distance apart and those in front would be moving wider and wider apart.

Here is a case in which we are sensible of our own motion and observe the effects of that motion in the positions of the fixed objects about us. We may turn the question about, and inquire whether the observed motions of the stars indicate any real motion of our own.

The outline of the problem is here much as it presented itself to Sir William Herschel in 1782. The details are extremely complicated. It is certain that we are *not* passing along through space among a vast number of *fixed* stars. Each star has a motion peculiar to itself. It also is moving along a vast orbit, and this real motion of the star is evident to our instruments. Combined with the veritable motion of the star itself is the parallax motion produced by the shifting of our point of view as the earth sweeps forward through space.

It is for analysis to separate the effects of these two motions and to determine what is the real direction and the real amount of the solar motion. The processes of the analysis cannot be given here, but fortunately it is easy to exhibit both the data and the results graphically. This has been well done by M. Flammarion in the figure that we copy.

The circle marked "Northern Hemisphere" gives the positions of those northern stars which are known to have a proper motion. The size of the dot representing each star gives the magnitude (*i. e.*, brilliancy) of the star. The arrows attached to the star represent the directions in which the stars move on the surface of the sky by their proper motions. The lengths of the arrows represent the velocities with which the stars move. At the time of making the map the stars are in the positions marked by the dots. At the end of 50,000 years they will be at the ends of their respective arrows.

Thus the data are all presented graphically. Notice what variety there is. Notice, too, the striking fact that some of the largest proper motions belong to some of the smallest stars. One would think that the brighter stars would be the nearer, and therefore that on the aver-

age they would have the larger proper motions. For evidence on this point I have compiled the little table which follows from Argelander's list of the 250 stars with the best known proper motions. I have chosen the fainter magnitude classes in order to get a sufficient number of stars:

77 stars between 6th and 7th magnitudes have a proper motion of $0.54''$ yearly; 80 stars between 7th and 8th magnitudes have a proper motion of $0.56''$ yearly; 58 stars between 8th and 9th magnitudes have a proper motion of $0.71''$ yearly.

That is, the proper motions do not seem to diminish as the numerical magnitude diminishes.

But to return to the plate. In the middle of the triangle formed by the pole (center) of the Northern Hemisphere and the two points XVII and XVIII on the edge is a figure like the sun. That is the point towards which the sun is moving. It is in the constellation Hercules, not far from the bright star Vega, which is near our zenith in the summer sky. In the corresponding position on the map of the Southern Hemisphere, which we do not reproduce, is a similar point; it is the point from which we come. All over the map are arrows not attached to any stars. These show the direction and the velocity of that part of the proper motion due to the motion of the solar system alone. In general the arrows belonging to the stars should agree in length and in direction with these unattached arrows—and in general they do, for the latter were derived from computations based on the former. But there are many exceptional cases; and, at first glance, it is the exceptions which seem to be the rule.

There is no space to refer to special cases except in passing; but the reader should note a pair of stars marked 21,258 (of Lalande's Catalogue) and 1830 (of Groombridge's Catalogue). They were about 15° apart in 1880, and on the map they may be found about half way from the pole (center) to the edge, near the straight line marked IX. In 50,000 years one will be on the straight line VI, and the other near the straight line XIII, at the very edge. They will be more than 200 diameters of the moon apart then, while now they are not more than 30 such angular diameters. Proper motion alone will in time change the whole aspect of the sky.

So MUCH for the map. Analysis gives the same results in numbers. It declares that the apex of solar motion is in the right ascension 260° and in declination 36° north, which defines the point in Flammarion's map marked by the figure like the sun; and analysis further declares that the amount of the solar motion in

one hundred years, if viewed from a point at the average distance of the 3222 Bradley stars, would be 5.05° .

If we know this average distance in miles, we can assign our own velocity in miles. With our best present knowledge, it follows that the sun, the earth, and the whole solar system are moving through space at the rate of

586,000,000	miles	per year.
1,600,000	"	" day.
67,000	"	" hour.
$18\frac{1}{2}$	"	" second.

The earth moves about the sun in its own orbit at about the same rate of 19 miles per second, while sun, earth, and orbit move along in space another 19 miles.

We can now go back to the stars themselves, and subtract from the observed proper motion of each star that portion (*motus parallacticus*) which is due to the motion of the solar system, and leave that portion which is due to the star's own motion (*motus peculiaris*).

Is there anything common to the truly proper motions of the stars? In the first place, it may be said that, so far as we know up to this time, these motions are, in general, not curved. They are practically straight lines. They have no common center. There is no great central body around which revolve the suns of all other systems. If there be such a body it will be many centuries before we shall know it; and we may say that, so far as our knowledge goes, there is none.

SYSTEMATIC MOTIONS OF THE FIXED STARS PARALLEL TO THE MILKY WAY.

BUT if we are obliged to consider the motions of all the stars to be practically in right lines, and not in closed orbits, there is no reason why we should not examine the question of whether the stars as a whole do not have some systematic motion—whether there is not among this variety some unity. The most natural hypothesis to start with is that the stars have a vast rotation in planes parallel to the Milky Way. We already have good data for examining this, and in a few years, when the zones of the *Astronomische Gesellschaft* are complete, much material will be added. Without some assumption of the sort, that the stars rotate in planes parallel to the Milky Way, it is hardly possible to explain the existence of the Milky Way itself. It would necessarily disintegrate more and more with the lapse of time, and it would be a pure accident that we happen to live at a time when this disintegration has not been accomplished. The investigation of this possible rotation has been carried out by two

pupils of Professor Gylden and of Professor Schoenfeld respectively. While the result in one case is fairly against the hypothesis of such a rotation, in the other it is somewhat in its favor. The doubt in the matter arises solely from the deficiency of the data, and this will soon be supplied. In the mean time it should be an answer to those objectors who ask what is the use of another new catalogue of stars, that this catalogue, and every other catalogue, goes a certain way towards providing the means for solving the very greatest problem that can be presented to the human mind by natural objects.

Look at the Milky Way stretching across the summer sky with the bright star Vega burning near it. Think that the few proper motions laboriously determined by Halley and Maskelyne enabled Herschel to announce that the sun, the earth, and every planet is moving towards a spot—near Vega—which he could point out. Think, too, that the smallest efforts of every faithful observer, the world over, go to the solution of the question, How do all these thousands of stars that I see move in space? Are they bound up with that Milky Way in one fate? Or is that permanent shining track, which seems unchanged since Job and the patriarchs looked upon it—is that doomed to destruction? The finger of analysis can point out the fate of those myriads of shining stars, and man becomes fit to live under their influence when his mind adds the beauty of law to the wayward beauty of their shining.

SPECTROSCOPIC PROPER MOTIONS—MOTIONS IN THE LINE OF SIGHT.

THE observation of a star's position is really nothing but the determination of the place where the line joining eye and star pierces the celestial sphere. The determination of its proper motion is nothing but the determination of the rate at which its apparent position changes. If a star is moving directly towards us, or directly away from us, its apparent place in the sky will remain unchanged. But we have in the spectroscope a means of measuring the motion of a star in the line of sight. The principle of the method is simple. The application of it is most difficult. Every one has noticed, in traveling upon an express train, the sudden clang of the bell of a train passing in the contrary direction; and how the note, the pitch, of the sound of this bell rapidly changes from high back to low again. Nothing is more certain than that the bell has but one essential pitch. Why, then, does it change? The engineer of the passing train hears his own bell giving always the same note, and this note is determined by the length of the

sound waves that reach his ear. Suppose them to come at the rate of about 500 per second to him. He is always moving at the same rate as his bell. But to us in the other train the case is different. When the bell is just opposite us 500 waves come to us per second; when we are approaching the passing train more than 500 come to us (not only the 500 sent out by the bell, but those others which we meet by our velocity); as we leave the passing train, less than 500 waves overtake us per second. Hence the pitch (the number of waves per second) varies. The same thing happens in the case of light. In the spectrum of a star there are certain dark lines the presence of which is due to hydrogen in the star's atmosphere. If the star is at rest with respect to us, these lines are not displaced in its spectrum; a definite number of waves per second (say *A*) come to us from the spectrum on both sides of these lines. If the star is approaching us, more waves than *A* reach us; if the star is receding, fewer waves reach us. The pitch of the line, so to say, is altered; and the spectroscope can measure this change of pitch.

When this is done with respect to the principal stars the most interesting results follow.

Vega (Lyrae) is found to be approaching us at the rate of 75 kilometers per second, Pollux is approaching us at 67 kilometers, Arcturus at 70 kilometers, etc.; while Castor is receding from us 44 kilometers per second, Regulus is receding 33 kilometers, Procyon 74 kilometers, and so on. After years the aspect of our sky will change. We shall have new glories in the galaxy, and after thousands of years these again will leave us. There is ceaseless change here as everywhere.

No adequate idea of the delicacy of the measures upon which these results depend can be briefly given; but delicate and difficult as they are, we have evidence that they are to be trusted. The independent observations of Dr. Huggins, Dr. Vogel, and Mr. Maunder of Greenwich show a good agreement. It is hoped that the Princeton telescope in the skillful hands of Professor Young may contribute to our knowledge of stellar motions in the line of sight; and this is a research to which the large refractor of the Lick Observatory will be especially devoted. The consistency of the results reached by the three observers named above for the stars observed in common by them makes the one exceptional case extremely interesting.

Sirius, the brightest star in the sky, was naturally among the first to be observed. It has been followed from 1875 to 1885, ten years, with the results given below:

<i>Year.</i>	<i>No. of measures.</i>	<i>Motion, per second.</i>
1875-77.....	8 ..	21.1 miles receding.
1877-78.....	8 ..	23.0 " "
1879-80.....	10 ..	15.1 " "
1880-81.....	4 ..	11.3 " "
1881-82.....	22 ..	2.1 " "
1882-83.....	18 ..	4.7 " approaching.
1883-84.....	43 ..	19.4 " "
1884-85.....	8 ..	21.5 " "

Here we have well-marked evidence of a real change in the direction of the motion of Sirius, with respect to the earth, and it is based on spectroscopic observations alone. It happens also that it was known, from observations with the telescope, that Sirius was moving in an elliptic orbit, and hence necessarily approaching us at times, and at times receding from us. It will not require many more years to determine all the circumstances of this motion, of which we unexpectedly have a double proof.

PARALLAXES OF THE STARS.

THE ancients placed all the fixed stars on the inner surface of a vast sphere which turned about the earth's center once each day. They had absolutely no way of even guessing how far off this sphere might be. In 1618 Kepler's guess was 4,000,000 times as far as the sun; in 1698, Huyghens placed Sirius 28,000 times as far as the sun; in 1741, Picard showed that the errors of observation with the instruments of his time were as great as the parallaxes of the stars themselves, and that therefore the problem was indeterminate to him; in 1806, Delambre concluded that the same thing remained true, notwithstanding the improvements of the instruments in the meanwhile. It was not till 1836 that W. Struve and Bessel really determined the parallax, and hence the distance of two different stars α Lyrae and β Cygni.

It is familiar to all that the distances of even the nearest stars are not to be conceived when they are expressed in miles or familiar units. No star is so near to us as 200,000 times 93,000,000 of miles. We have to express these distances in terms of the time required for light to pass from star to earth. For β Cygni that time is 2377 days, or $6\frac{1}{2}$ years. It was the elder Herschel who put these immense distances before us in the true light, by showing that if to-day the star were blotted out of existence its mild light would shine on for years, until the last ray that left it had finally ended its long journey and reached the earth, more than six years afterwards.

But all stars are not equally distant. The light from one star may be 10, from another 100, from another 1000 years old when it reaches us. We must no longer regard the study of the stars as a study of their contem-

poraneous existence. It is rather the ancient history of the universe which is exhibited to us by the vault of heaven. Assiduous observers have determined the parallaxes of about a score of stars. The first stars to be examined were either the brightest (as in the case of Vega), or those of large proper motion (as β Cygni). In general, the brightest stars should be the nearest, one would think, and yet the very largest parallaxes belong to the fainter stars. Similarly the star with the greatest proper motion has a very small parallax.

By treating all the certain data in various ways, Professor Gylden has come to the conclusion that the average parallax of a star of the first magnitude is about $0.084''$, or that the average distance of our brightest star is 160,000,000,000,000 miles. But to make farther steps in the problem of the "construction of the heavens," we must know more than the average parallax of the brightest stars. We must be able to assign the average parallax of stars of each order of magnitude, and this in both hemispheres.

This task is now undertaken for stars down to the fourth magnitude by two observers who have already distinguished themselves in this field—Dr. Gill, Royal Astronomer at the Cape of Good Hope, and Dr. Elkin, now at Yale University Observatory. These gentlemen have devoted their energies to this one problem, which will require perhaps ten years for its solution in the form that they have chosen for it. Dr. Ball, Royal Astronomer for Ireland, is systematically searching for stars of large parallax and incidentally proving many stars to have small parallax—a fact which it is just as important to know as its converse.

The next dozen years will show immense strides in our knowledge of the stellar distances of individual stars, and it may well be that some general relation between distance, brightness, and proper motion of situation in the sky will result from the great increase of data.

DISTANCES OF STARS OF EACH MAGNITUDE.

The golden time for astronomers will come when the parallaxes of enough stars have been determined for them to be able to say that the distance of an average third, fourth, sixth, or tenth magnitude star is so many, or so many, times the sun's distance. That time has not yet come, nor will it have come even when the great work undertaken by Messrs. Gill and Elkin has been ended. There is no certain way of assigning the stellar distances but by measurements such as they are making. But it is a fair procedure to make certain assumptions as to stellar distances, to work out the logical consequences of these assumptions,

and to compare these consequences with known facts. An agreement with the facts will, in some degree, support the assumptions. If we assume the stars to be of equal brilliancy one with another, we have one basis of computation. If we suppose them, further, to be equally distributed in space on the average, we have another basis. These conditions lead at once to the following table:

Magnitudes.	Relative Distances.
1	1.00
2	1.54
3	2.36
4	3.64
5	5.59
6	8.61
7	13.23
8	20.35

We can test these assumptions to some extent. If they are true, then the ratio of the actual number of stars of any brightness to the actual number of stars of the next lower grade of brightness, raised to the two-thirds power, should be 0.400. Using the stars of the sixth and seventh magnitudes, this number results 0.426; of the seventh and eighth, it results 0.4003, etc. The two hypotheses are in the main not far from correct, and therefore the relative distances above given are not very far wrong for stars down to the eighth magnitude. There is strong reason to believe that the fainter stars, from eleventh to fifteenth magnitudes, do not follow the same law. We have seen that the average distance of a first magnitude star is 160,000,000,000,000 miles. Multiply this by 20.35 and you have the best estimate now available of the distance of an eighth-magnitude star. It is inconceivable, but no more so than the first number. Light would require 600 years and more to reach us from such stars.

DISTRIBUTION OF THE STARS OVER THE SURFACE OF THE CELESTIAL SPHERE.

THE real question to be solved is, How are the stars distributed throughout solid space itself? To solve this question completely the distance of every star from the earth must be measured (which is a simple impossibility), or else we must find some law which connects the brightness, or the proper motion, or the position of a star with its distance. Suppose that 10 stars of each magnitude from the brightest down to the faintest are selected—say 150 or 160 in all—and that the parallax of each individual star is determined. This would be a tremendous labor in itself, and would require the work of several observers for a score of years. But suppose this work done. Suppose that the average distances of the ten stars of each group resulting from the measures were I, II, III, IV, V ———— XIII,

XIV, XV, XVI. Would any general relation exist between the magnitudes 1 — — — — 16 and the corresponding distances I — — — — XVI? From those measures that we already possess this is by no means sure. In fact, the evidence seems to be directly opposed to this conclusion. The average measured parallax of 5 first-magnitude stars is about $0.27''$; of 3 fourth-magnitude stars about $0.13''$; of 3 fifth-magnitude stars about $0.31''$; of 7 sixth-magnitude stars about $0.21''$. That is, the parallax does not seem materially to decrease as the brilliancy diminishes from the first to the sixth magnitude. If, instead of comparing the magnitudes with the distances, we compare the proper motions, there seems to be no evident agreement. The stars with the largest proper motions do not in general have the largest parallaxes (and hence the smallest distances). We have not enough determinations of parallax to decide whether the region of the sky in which a star is situated has any relation to its distance; so that for the present we are not sure that a series of measures so extensive even as the one we have imagined would solve the question of the relation between magnitude, or proper motion, and parallax. Such a series would go a great way towards deciding whether the question was solvable or not. It would add enormously to the very small number of certain facts bearing on the subject of the constitution of the stellar system. And it is to the great credit of this generation of astronomers that such a series has actually been begun (for stars of from first to fourth magnitudes) by Messrs. Gill and Elkin at the Cape of Good Hope and New Haven respectively, as has been mentioned already.

In the absence of real knowledge with regard to the distribution of the stars in space, much labor has been expended on the study of what we may call stellar statistics — the statistics of the distribution of the stars on the surface of the celestial vault. This distribution of the stars is known when once we have a map of their positions, which it is comparatively easy to make. Or a more rapid method of studying this distribution may be employed — that of *star gauging*, so called by Herschel, its inventor. This consists essentially in counting the number of stars visible in the field of the telescope as it is directed to various known portions of the sky. The mere number of stars visible at each pointing may be laid down on a map, like the soundings on a hydrographic chart. The data are easily gathered. How are they to be interpreted? We may briefly indicate one obvious method. Suppose that we have made such star gauges with telescopes of five different powers over the same areas in the sky. The

largest telescope will show all the stars say down to and including the fifteenth magnitude; the next smaller those to the fourteenth; the next to the thirteenth, the twelfth, the eleventh (the actual distribution of the individual stars from first to tenth magnitudes is known by the *Durchmusterungen*). In any area the difference between all the *Durchmusterung* stars (from one to tenth magnitude) and the number seen in telescope I (the smallest of the five supposed) will give the number of the eleventh-magnitude stars in that region.

The difference between the counts by telescope I (which shows all stars down to and including the eleventh magnitude) and telescope II (which shows all to twelfth magnitude) will give the actual number of twelfth-magnitude stars. Combining the results of the telescopes II and III we should have the number of thirteenth-magnitude stars for this region, and so on for the fourteenth and fifteenth magnitudes. Thus the actual number of the stars of each magnitude in this area (and similarly for other areas) will be known. We may interpret these figures somewhat in this way. Take a map which shall have spaces on it for the whole sky, and devote this map to exhibiting the results of our gauges for the fifteenth-magnitude stars. Wherever there are 100 of these to the square degree lay on one tint of color; wherever there are 200, two tints; 300, three tints, and so on. The final map will exhibit to the eye the results of our gauges for the fifteenth-magnitude stars. Where the tint is deep, there are more stars; where it is light, fewer. Another such map must be made for the fourteenth-magnitude stars; another for the thirteenth, and so on. Now place these fifteen maps side by side before you, and it will be possible to obtain at once a number of definite conclusions. Here the stars that we call fifteenth and those that we call fourteenth are really connected together in space. Why? Because this long ray of many fifteenth-magnitude stars on one map is matched by this other long ray of just the same position and shape of the fourteenth-magnitude stars. The thirteenth, too, we will say, is similar. But the ninth, tenth, eleventh, and twelfth do not in their distribution at all resemble the fainter stars in this region, but they do resemble each other. In this way, passing from region to region, the general peculiarities of each region may be made out, and much light may be thrown on the vital question, How many magnitudes of stars exist at the same distance from us? Are the stars of the so-called ninth, tenth, eleventh magnitudes all really at the same distance from us, and are their differences in brightness simply due to differences in size, or are they really at different distances?

A large amount of evidence upon these fundamental points already exists, and more is being accumulated, and it appears possible that a skillful use of it may throw much light on the real question. The new photographic processes will be of immense importance for this investigation. We have not the space to go farther into this method of research, but we may just refer in passing to one interesting form of it. We have already elaborate maps of certain portions of the sky showing the position and magnitude of every star down to the thirteenth. These are the maps used for the discovery of asteroids. From each of these maps we can make thirteen others, each of which latter shall show the stars of one magnitude only. Now compare these thirteen derived maps, and see what the evidence is that the stars of any two magnitudes are connected or independent. This method is capable of bringing out most interesting conclusions when it is thoroughly carried out, as it has not yet been to any large degree. The local arrangements of stars can be adequately studied in this way; and it is not too much to expect that the typical forms of stellar systems—distorted by perspective, of course—may be exhibited here.

Suppose one typical form to be a circular ring, as it appears to be. The apparent dimensions of these rings may well give us a clue to the relative distances of the stars of which they are composed. The preliminary work of this kind which has been done at the Washburn Observatory appears to promise some definite results in this direction.

MASSSES OF BINARY AND OTHER STARS.

THE binary systems are those composed of two stars which are connected with each other by a mutual gravitation. They revolve about a common center of gravity in orbits which can be calculated. In some few cases the parallax of these stars is known; and in every such case the sum of the masses of the two stars becomes known in terms of the mass of our own sun. It is especially noteworthy that in every known case the mass of the binary system is not very different from the mass of our own sun. That is to say, all the stars whose masses are known at all are such bodies as our sun is: they shine with light like his; they are of the same order of magnitude mass.

The term "hypothetical parallax" is applied to a parallax computed for a binary star on the supposition that the mass of the binary, although unknown, may be hypothetically assumed to be the same as the sun's mass. So far as we can judge, these hypothet-

ical parallaxes must be provisionally accepted as essentially correct.

If we can assume that the intrinsic brilliancy of the fixed stars is the same for each star, which does not seem to be a very violent supposition, several interesting conclusions follow which can only be stated here.

If it be true that for the stars, taken one with another, a square mile of surface shines with an equal light for each star, then among stars of known distances some must be at least 270 times as great in diameter as others. This is about the proportion of the sun to Mercury. Also it follows that binary stars whose colors are alike must be composed of stars of like size; and also, that on the average the brightest star of any cluster is about four times as large as the smallest star of the cluster. No star is more than 200,000 times farther than the nearest fixed star. Other assumptions which might serve as a basis for computation will give other results; but for the present we have to content ourselves with some such assumption, and in the infinite variety of circumstances among the fixed stars choose that one as general which seems to be the most likely *a priori*, and which leads to results which agree with the facts of actual observation.

THE CLUSTER OF STARS TO WHICH OUR SUN BELONGS.

THE *Uranometria Nova* of Argelander gave the positions of the lucid stars of the northern sky, and it has been supplemented by the *Uranometria Argentina* of Dr. Gould, which covers the southern sky. With the stellar statistics of the whole sky before him Dr. Gould was in a position to draw some extremely interesting conclusions with respect to the arrangement of the brighter stars in space, and to the situation of our solar system in relation to them. The outline of his reasoning can be given here, but the numerical evidence upon which his conclusions are founded must be omitted. In the first place, it is fairly proved that in general the stars that are visible to the naked eye (the lucid stars) are distributed at approximately equal distances one from another, and that on the average they are of approximately equal brilliancy. If we make a table of the number of stars of each separate magnitude in the whole sky we shall find that there are proportionately many more of the brighter ones (from first to fourth magnitudes) than of the fainter (from fourth to seventh magnitudes). That is, there is an "unfailing and systematic excess of the observed number of the brighter stars." We cannot suppose, taking one star with another, that the difference between their apparent brightness arises simply

from real difference in size, but we must conclude that the stars from the first to fourth magnitudes (some 500) are really nearer to us than the fainter stars. It therefore follows that these brighter stars form a system whose separation from that of those of the fainter stars is marked by the change of relative numerical frequency.

What, then, is the shape of this system? and have we any independent proof of its existence? Sir John Herschel and Dr. Gould have pointed out that there is in the sky a belt of brighter stars which is very nearly a great circle of the sphere. This belt is plainly marked, and it is inclined about 80° to the Milky Way, which it crosses near Cassiopea and the Southern Cross. Taking all the stars down to 4.0 magnitude Dr. Gould shows that they are more symmetrically arranged with reference to this belt than they are with reference to the Milky Way. In fact, the belt has 264 stars on one side of it and 263 on the other, while the corresponding numbers for the Milky Way are 245 and 282. From this and other reasons it is concluded that this belt contains brighter stars because it contains the nearest stars, and that this set of nearer and brighter stars is distinctively the cluster to which our sun belongs. Leaving out the brighter stars which may be accidentally projected among the true stars belonging to this cluster, Dr. Gould concludes that our sun belongs to a cluster of about 400 stars; that it lies in the principal plane of the cluster (since the belt of bright stars is a great, not a small circle); and that this solar cluster is independent of the vast congeries of stars which we call the Milky Way.

We know that the sun is moving in space. It becomes a question whether this motion is one common to the solar cluster and to the sun, or only the motion of the sun in the solar cluster. The motion has been determined on the supposition that the sun is moving and that its motion is not systematically shared by the stars which Dr. Gould assigns to the solar cluster. But a very im-

portant research will be to investigate the solar motion without employing these 400 stars as data.

In what has gone before I have tried to exhibit some of the main questions in purely Sidereal Astronomy; to show some of the more important results already reached, and especially to indicate the directions along which present researches are tending. It is impossible to give a complete view in this or in any other single branch of astronomy, for they are all indissolubly bound together.

The methods of the new astronomy have taught us that in the condition of the variable stars, where the intense glow has cooled to a red heat, we can see the future of our own sun as well as its past in the brilliant white and violet of the brightest and youngest stars. It requires the profound mathematical analysis of Gylden to interpret his equations so as to explain to the new astronomy exactly how the phenomena of the rotation of variable stars produce the effects which are observed by its methods.

Professor Langley measures the light and heat of the moon by the new methods; Professor Darwin interprets the mathematical theory of the tides so as to trace back the origin of that heat to the remote time when the earth and moon formed one mass, and rotated in less than an eighth part of our present day. All the parts of the complex science are intimately connected, and no one can be separately treated without losing sight of many lines of research of the greatest promise and importance.

But I hope that enough has been said to show that the old astronomy is not idle; that it has its new side; and that its energies are addressed to the solution of tremendous problems of the highest significance. In broad terms, it seems to me to be the noble aim of the new astronomy to trace the life-history of an individual star, and of the old to show how all these single stars are bound together to make a universe. There is no antagonism in their objects. Each is incomplete without the other.

Edward S. Holden.

WAVES AND MIST.

THIS is the fancy that thrills through me
Like light through an open scroll:
The waves are the heart-throbs of the sea,
And the white mist is her soul.

William H. Hayne.

TOPICS OF THE TIME.

Modern Collegiate Education.

THIS month will witness the annually recurring revival of the general educational system of the country. The machinery of public schools, private schools, colleges, and universities will begin to move again after the summer vacation; and men and women who have for weeks been thinking only of recreation will turn their thoughts again to the great questions which come up in the process of education. The season, then, seems an appropriate one at which to call attention to one of these questions, primarily affecting our modern development of collegiate education, but touching very many other phases of the whole educational system.

One can hardly look at the schedule of studies in the better equipped American colleges without a special wonder at the magnitude and completeness of its machinery, surpassing anything that our forefathers could have considered possible. In some institutions two hundred courses or more are offered to the academic undergraduate students, covering every variety of topic, from Pali to Political Economy. The work of instruction in every department and sub-department is coming more and more to be done by men specially trained, and often distinguished, in their own lines of study, to whom the body of facts in those lines is almost as ready as instinct itself, and who pour out those facts upon their pupils as if from an ever-swelling fountain. In the logical outcome of the American college curriculum the whole body of human knowledge seems to be gathered together and laid before students for their consideration and appropriation. One cannot help feeling a certain further satisfaction as he marks the development of a new and indigenous type of university life, a natural outgrowth of the American college system, as it bursts beyond its original limits.

We are apt to think of the former American college as differing from the present type only in degree, in its smaller number of professors and students, and in its smaller facilities for work. The absolute meagerness of the college curriculum of a hundred years ago needs to be seen in order to point the contrast with the radically different spirit of its modern successor. The materials for such a contrast are easily accessible; and, as a type of the higher education of the time, we may take the four-years' course at Yale, towards the end of the last century, as given by President Dwight. *Freshman Year*: Græca Minora; six books of the Iliad; five books of Livy; Cicero de Oratore; Adam's Roman Antiquities; Morse's Geography; Webber's Mathematics. *Sophomore Year*: Horace; Græca Majora; Morse's Geography; Webber's Mathematics; Euclid's Elements; English Grammar; Tytler's Elements of History. *Junior Year*: Tacitus; Græca Majora; Enfield's Natural Philosophy and Astronomy; Chemistry; Vince's Fluxions. *Senior Year*: Logic; Chemistry; Natural Philosophy and Astronomy; Locke on the Human Understanding; Paley's Moral

Philosophy; Theology. If this course differed from those of other colleges of the time, it was only in its greater completeness and in the thoroughness with which it was given.

And yet it was from such institutions and courses of study as this that the country received its great men of the past—men to whose work not only the students but the instructors of the present still look for guidance. The case is strongest with regard to public men, for the lack of law-schools and of any higher phase of education then made the meager undergraduate curriculum practically the only basis for the future statesman's training. With little or no historical or political instruction colleges then sent out men whose treatment of difficult problems of law and government must still command our admiration and respect. Omitting lesser lights, there were in public life or in training, in the latter part of the last century, from Harvard, the Adamsses, Bowdoin, Dexter, Eustis, Gerry, John Hancock, Rufus King, Lowell, Otis, Parsons, the Quincys, and Strong; from Yale, Joel Barlow, Silas Deane, Griswold, Hillhouse, the Ingersolls, Tracy, the Trumbulls, and Wolcott; from Princeton, Ellsworth, Luther Martin, Pierrepont Edwards, Madison, Bradford, Lee, Burr, Morgan Lewis, Brockholst and Edward Livingston, Dayton, Giles, Bayard, Harper, Mahlon Dickerson, Berrien, Rush, Forsyth, and Sergeant; and from Columbia, Hamilton, Jay, Robert R. Livingston, and Gouverneur Morris. Are the institutions named as well represented in public life now? If we leave out of account those men now in public life who represent only the law-schools of Harvard, Yale, and Columbia, and not their undergraduate departments, the contrast would be most striking; and we might almost conclude that the influence of these four institutions on public life had decreased in direct proportion to the increase of their undergraduate curriculum.

The case is much the same in literature. Bowdoin's class of 1825, trained under the old meager system, gave more names to American literature than most of our departments of English Literature have yet succeeded in adding. Similar contrasts might be brought out in other directions; but the rule is sufficiently well established to call for explanation. Medicine and science, however, may fairly claim to have held their own; and perhaps an explanation may be found in this exception to the general rule.

The wonderful development of modern science has been rather one of principle and methods than of mere facts: the accumulation of fact has been a consequence of the change in method, though it in turn has often developed unsuspected principles, or forced a new change of methods. Is it not possible that the modern development of the college curriculum in other respects has as yet gone too largely to the mere presentation of facts? The instructor, tending constantly to specialism, is as naturally tempted to gauge the success of his work by the greater breadth and completeness with which he states the facts embraced within his subject.

If this is the principle which guides or controls him, the increased number of courses will mean merely that facts which were only suggested or were entirely ignored under the old system are now stated in full. That would mean that the student has his mental food chewed and almost digested for him, and may go through a four-years' course in college without thinking ten thoughts of his own from first to last; while the student under the old régime, compelled to do his own thinking on a great variety of subjects, developed principles and methods for himself, and then accumulated facts during the years in which the modern student is engaged in forgetting them.

The contrast already alluded to is perhaps more suggestive in the case of Princeton than in that of the other three colleges. The list of her alumni who became distinguished in public life is quite a long one; but it is noteworthy that it is almost literally limited to the years between the inauguration of President Witherspoon and the graduation of the last class which he can be supposed to have influenced (1768-97). During those years there is scarcely a class without the names of one, two, or more men who became distinguished more or less in public life; after the last-named date, such names become far more sporadic. In this case, at least, it was a matter of more serious import that the *man* had died than that the curriculum should be widened.

If there be any element of truth in the explanation here suggested rather than worked out, there is not the slightest necessity for destroying any of our college buildings, for stopping or limiting the development of elective courses, or for reverting in any point to the meager curriculum of the past. All that is necessary is that the college should see to it that the instructor should not convert the elective course into a machine for "cramming" the student within narrower lines as he never was crammed under the old system; and that the student shall not, under the guise of a wider freedom, be deprived of the license and encouragement to think for himself which the old system gave him. After all, it is from the two or three men out of a hundred who think for themselves, and think correctly, that a college must expect to obtain the reputation which comes from a line of alumni distinguished in public life, in literature, and in all forms of human activity.

Individuality in Teaching.

THE criticism that sees danger to the schools in the elaboration of systems and puts forth even the faintest plea for individuality in teaching must meet the counter-criticism of those who point out that genius keeps to the mountains and only mediocrity finds its way to the school-room.

How easily can the names of the great teachers of youth be counted upon the fingers of one hand! Of the great teachers of the common-schools we have almost no traditions. Pestalozzi and Froebel made it possible for mediocrity to reach a child's mind; but without well-learned guiding-lines, the average instructor makes the school-room a chaos where ignorance becomes its own law and shuts out knowledge.

In some such manner the pleader for system might argue. But the great difficulty is that we have not yet

learned the relative meaning of ignorance and knowledge. We do not teach the right things and we do not get the best results. We use examinations as gauging-lines, but our percentages do not show true values. We get bits of information and progressive series of bits, but we have flooded the child's mind, not developed it. Our school-room work too often runs along the line of mere suppression — suppression of teacher, suppression of pupil, suppression of individuality; the apotheosis of ruts. We build up elaborate school systems in our great cities, bind all the schools together in a series of grades, apportion the hours for all work,—indeed, the very minutes,—set a thousand machine-moved teachers in the schools, and then pour in an overcrowded throng of children and begin to examine them. The children are of all sorts and nationalities: some well fed, well cared for, and well loved; some almost barbaric, with generations of ignorance and poverty and indifference to education behind them. But our education of all lies chiefly in our examinations, in which the teachers are examined with them, for upon the results depend the teachers' fortunes. This is one of our proud methods of building up the state. Of instruction, of character-forming, of mental growth, there is scarcely a thought. Often it seems but a great and complex system for wasting the formative years of childhood.

Now it is certain that we must have system and method, but we must have something besides. Train our teachers well, but allow them a certain liberty to work out results. It is not information that we should ask of school-children so much as it is character and mental life. What are values? — that should be a child's first lesson. Make a boy feel the worth of a thing, and the hard road becomes a pathway to the stars. He feels his share in the future; he knows his place in the universe, and is its heir. Character, right ambition, character — get the value of these in a boy's mind, and your road becomes easy.

The power to think for one's self has too little standing in the schools; and we do not insist enough upon the appreciation of the worth of the school work. Too often we try to wheedle our children into knowledge. We disguise the name of work, mask thought, and invent schemes for making education easy and pleasant. We give fanciful names to branches of study, make play with object-lessons, and illustrate all things. To make education amusing, an easy road without toil, is to train up a race of men and women who will shun what is displeasing to them. But there is no substitute for hard work in school if we are to have a properly trained people; we must teach the value of work and overcome the indifference of children to ignorance.

No one ever came nearer to success of this sort than the Rev. Edward Thring,* who for thirty-four years was head-master of the grammar-school at Uppingham, England. What his methods were, this is not the place to state; but he insisted upon nothing more strongly than upon this, that it was not enough for the teacher to know the subject taught and why it should be taught, but that the child too should feel its value for him and be assured of his ability to absorb the knowledge. He always insisted upon preparing the child's mind for the knowledge to be implanted. The

* See article on "Uppingham" in this number of THE CENTURY.

mind itself was his chief care; of mere information he had slight respect. He worked for a strong mind, not a full one; for mental life, mental activity, and power.

In America, Frederick W. Gunn,* working along similar lines, influenced his pupils with such power that his school became a wonderful force for the formation of character. With both these men character was the object sought. With both, education meant character, mental life, and growth, not knowledge-lumps and the accretion of book lore. Both were successful, for they held their own high level, kept faith with their convictions and their duty, and did not attempt impossible things.

A Just Employer.

NOT long ago a foreigner shook his head sadly as he wrote about New England. Its stony hills and rocky coast, its glacier-plowed and niggardly soil, its over-hot summers and over-cold winters, were, he deemed, unfavorable for the nurture of men and the development of a great state. The time would come when the New England man would have to yield to the odds against him. This fanciful theory has no warrant.

How New England men get and keep dominion over unkind nature—how they help build the state—may be shown in a notice of one of its good men, Samuel D. Warren, whose body after seventy years of activity was recently laid to rest. The record of his life is uneventful but full of suggestion. He left his birthplace, at Grafton, Massachusetts, to make his way in the world when he was only fourteen years of age. He was not strong in body; his education was necessarily slender; he had no rich kinsmen to lean upon. A good mother and a sound New England religious sentiment had given him something better,—strong principles and high ideals,—and he went cheerfully to the first work he found, to the drudgery and poor pay of an office boy in a Boston paper-selling house. His advancement was slow. Although a junior partner soon after reaching his majority, he was nearly forty years old before he thought himself strong enough to buy and manage unaided a small paper mill in Maine that did not then give work to one hundred hands. But he made

* See "The Master of The Gunney," published by The Gunn Memorial Association; see also Dr. J. C. Holland's "Arthur Bonnicastle," in which Mr. Bird and the Bird's Nest stand for Mr. Gunn and the Gunney.

it prosperous. In ten years he stood in the front line of American manufacturers, for his paper had earned and kept a world-wide reputation. At the time of his death his Cumberland Mill was the largest paper mill in the world, perfecting forty tons of paper a day and giving direct employment to more than eight hundred persons.

The daily and weekly papers of New England have already chronicled the more important details of his business life, as well as his liberality to churches, hospitals, and asylums. They need not be repeated. That he has acceptably made for many years the paper for *THE CENTURY* and for "St. Nicholas" calls for at least a passing notice; but evidences of his skill and public spirit seem less deserving of special comment than his efforts in another direction which as yet have not been noticed at all.

In his own way Mr. Warren did much to allay the unjust strife between capital and labor. In every other large manufacturing village strikes and lock-outs were frequent. Some regarded them as unavoidable phases in the relation of masters and workmen. "Offenses must come." But there was never a strike in Cumberland Mills, before which the fowlers of the labor unions spread their nets in vain. This steady resistance of the workmen to snares which elsewhere never missed their object is due to the conscience of Mr. Warren. He did not think his duty done when he paid his workmen agreed wages. He made it his duty to have them live in good homes and enjoy life. He built the houses, and equipped them better than other houses of a similar class, and offered them at lower rent. The church and the school-house were supplemented by a public library, a gymnasium, and a large room for social gatherings. Other manufacturers of New England have done similar work, but few have done it with equal tact. Certainly no one has done it with greater success. Whoever walks around the little village and notes the general tidiness of the place, its neat houses and trim gardens, its cheery and frank-faced men and women, its exemption from beer-gardens and dance-halls and variety shows, and then compares the cleanliness of this with the squalidness of other manufacturing villages that he may have seen, will at once admit that the molding of paper, worthy work as it is, is not so worthy as the molding of the fortunes and the characters of human beings.

OPEN LETTERS.

Gettysburg Twenty-five Years After.

THE spectacle exhibited at Gettysburg at the recent meeting of Union and Confederate veterans, twenty-five years after the battle, and the sentiments expressed by such battle-scarred heroes as Slocum, Sickles, and Longstreet, Beaver, Hooker (of Mississippi), Robinson, and Gordon, should swell every American heart with the most legitimate pride. It is well, however, that while indulging in justifiable exultation, we, and especially our descendants, should forever remember the lesson taught by the thorough-hearted reconciliation of those who for four years were such deadly foes. It is well that those who come after us shall understand the *true* and *rational* ground of the national

pride which they should cherish, chiefly as an incentive to equal nobleness of achievement. Our pride is not based solely upon the unsurpassed valor displayed upon both sides, for other soldiers in many other lands and times have fought as well, though none better. "*Vixere fortes ante Agamemnona.*" It has a nobler and loftier source. It is the unequaled—in fact, the unapproached—generosity and magnanimity of the American character which alone in all history was able to achieve victory without vengeance, and to accept the consequences of defeat without degradation and without rancor. It is this noble trait which places us foremost of all the world.

For, without going back to antiquity, which is full of the massacres and proscriptions of the vanquished,

no such example has ever been seen before among the most enlightened nations. Did Puritans and Cavaliers ever join hands in harmony, or the Jacobites and the followers of the House of Hanover? It was only after the scaffolds and proscriptions of the Restoration, offset later by those which followed the bloody field of Culloden—it was only after generations had passed and death had removed the last of the "Pretenders" that Great Britain ceased to be torn by insurrections and party hatreds. But even at this day, what Irishman can tamely accept the position into which England has forced his country? What Polish patriot has ever acknowledged that Russian conquest was best for his people, though more than half a century has elapsed since its completion?

No nation ever passed through such an internal conflict as ours. The nearest approach to it was the struggle of La Vendée against the French Republic in 1793-98; and after three generations it can hardly be considered as altogether ended, for no Vendéan leader has ever given hearty and complete allegiance to any government that France has had since those days, except to the Bourbon restoration. The descendants of La Rochejaquelein, of Charette, Lescuré, and Cathelineau, as well as the sons of the brave and fanatical Vendéan peasantry of '93, are to-day the bitterest foes of the Republic, and proclaim openly, even in the National Assembly, their purpose to destroy it and to reestablish "the throne and the altar" upon its ruins.

Now mark the contrast. We have not had to wait until another generation took the place of the combatants. Less than twenty-five years after the close of our gigantic war the very men who fought it meet spontaneously in fraternal concourse, without the least utilitarian or political purpose, but simply in obedience to the irresistible impulse of their hearts, whose desire for union and harmony amounts to enthusiasm; and the unanimous sentiment of all is one of exulting happiness at the result which has made us one people, more thoroughly united than we ever were before, rallying with boundless devotion around the national flag and Government.

What is the cause of this wonderful contrast?

Respect for each other's valor, though a factor, would not have sufficed to efface animosities. Surely the Russians must have honored the Polish patriots' bravery; and the Blues, who fought for the Republic, could not help respecting the reckless daring of the Whites, who fought for king and altar in La Vendée. But this feeling has failed to allay the rancor and hatred caused by past but still unforgettably cruelties.

Nothing can account for the contrast but the superior intelligence, generosity, and magnanimity of the American people, who even in the heat and violence of conflict never regarded as a crime an honest difference of opinion, even though carried to the extreme of armed resistance. Whatever may be said by those who never realized what war has been and is in other lands, there is no question that, on the whole, our war was the mildest and most humane ever fought, and the freest from those excesses usually considered the inevitable concomitants of war. There were no slaughters of prisoners after surrender, no scaffolds, no *fusillades*, no *noyades* of the vanquished, as in Poland and La Vendée; and never were fewer men executed as spies, or guerrillas (*francs-tireurs*), according to the

recognized code of war. And when, at the final act of the drama, the conqueror had the power to demand unconditional surrender, how generous were the terms offered, how regardful of even the soldierlike honor of the conquered!

Although after the struggle of arms had ceased, some oppressive legislation, which would have better been omitted, prevailed for a short time, yet not one of the so-called rebels was deprived of his life or property, or driven into banishment, for any act done during the war. Years ago even the most prominent supporters of the late Confederacy were readmitted to all the privileges of American citizenship. As said Governor Beaver the other day, "You are our equals in courage, perseverance, and intelligence; our equals in all that dignifies and adorns the American character." He might have added also—equals in devotion to our common country.

Hence it is why there are no bitter and revengeful memories of bloodshed, otherwise than on the battle-field in honorable warfare, to perpetuate hatred and animosities between us and our descendants. This is why the Confederate veterans acknowledge in all sincerity of heart that the war ended in the way that was *the best* for the entire country, and why those who wore the blue and the gray can clasp hands with heartfelt sympathy and affection, and all of us, North and South, are ready to shed all our blood, if need be, in defense of our truly reunited country. This is why we have no Poland, no Ireland, no Vendée in our blessed land. This is why we can point all other nations to the unequalled record of American generosity, forgiveness, and magnanimity, far more glorious than the victories of war. Above all, this is why we can leave to our posterity the noblest inheritance and the noblest memories that any people ever had. May they ever remember the grand old maxim: *Noblesse oblige!*

R. E. Colston,
Formerly Brigadier-General, C. S. A.

Is the Siberian Exile System to be at Once Abolished?

I DO not believe that the exile system is upon the eve of abolition, nor that it will be abolished within the next ten years; and I will state, as briefly as I can, some of the reasons for my skepticism.

The number of criminals now sent to Siberia annually, not including innocent wives and children, varies from 10,000 to 13,000. These criminals may be divided, for my present purpose, into five great classes, viz.: First, hard-labor convicts; secondly, compulsory colonists; thirdly, communal exiles (persons banished, on account of their generally bad character, by the village communes to which they belong); fourthly, vagrants; and, fifthly, political and religious exiles. The proportion which each of these classes bears to the whole number of banished may be shown in tabular form as follows, the figures being taken from the report of the Bureau of Exile Administration for the year 1885:

Criminal Class.	Number.	Per cent. of whole number.
Hard-labor convicts.....	1551	15.16
Compulsory colonists.....	2841	27.78
Communal exiles.....	3751	36.66
Vagrants.....	1719	16.80
Political and religious exiles...	368	3.60
Total.....	10,230	100.

When this great body of offenders reaches Siberia it is divided into two penal classes, viz.: First, criminals who are shut up in prisons, and, secondly, criminals who are assigned places of residence and are there liberated to find subsistence for themselves as best they may. The first of these penal classes—that of the imprisoned—comprises all the hard-labor convicts and all of the vagrants, and numbers in the aggregate 3270. The second, or liberated class, includes all of the compulsory colonists, all of the communal exiles, and most of the political and religious offenders, and numbers in the aggregate nearly seven thousand.

It is manifest, I think, that when a flood of ten thousand vagrants, thieves, counterfeiters, burglars, highway robbers, and murderers is poured into a colony, the class most injurious to the welfare of that colony is the liberated class. If a burglar or a thief is sent to Siberia and shut up in prison, he is no more dangerous to society there than he would be if he were imprisoned in European Russia. The place of his confinement is immaterial, because he has no opportunity to do evil. If, however, he is sent to Siberia and there turned loose, he resumes his criminal activity, and becomes at once a menace to social order and security.

For more than half a century the people of Siberia have been groaning under the heavy burden of criminal exile. More than two-thirds of all the crimes committed in the colony are committed by common felons who have been transported thither and then set at liberty, and the peasants everywhere are becoming demoralized by enforced association with thieves, burglars, counterfeiters, and embezzlers from the cities of European Russia. The honest and prosperous inhabitants of the country protest, of course, against a system which liberates every year, at their very doors, an army of seven thousand worthless characters and felons. They do not object to the hard-labor convicts, because the latter are shut up in jails. They do not object to the political and religious exiles, because such offenders frequently make the best of citizens. Their protests are aimed particularly at the compulsory colonists. Half the large towns in Siberia have sent memorials to the Crown asking to be relieved from the burden of communal exile and criminal colonization; nearly all the governors of the Siberian provinces have called attention in their official reports to the disastrous consequences of the exile system as it is now administered; the liberal Siberian newspapers have been hammering at the subject for more than a decade; three or four specially appointed commissions have condemned criminal colonization and have suggested methods of reform—and yet nothing whatever has been done. Every plan of reform submitted to the Tsar's ministers up to the present time has been found by them to be either impracticable or inexpedient, and has finally been put, as the Russians say, "under the table-cloth." Not a single plan, I believe, has ever reached the stage of discussion in the Council of State.

Within the past five years great pressure has been brought to bear upon the Government to induce it so to modify the exile system as to relieve the Siberian people of a part of their heavy burden. Mr. Galkin-Vrasskoi, the Chief of the Prison Department, has made a journey of inspection through Siberia, and has become convinced of the necessity for reform; General Ignatief and Baron Korff—both men of energy and

ability—have been appointed governors-general in eastern Siberia and have insisted pertinaciously upon the abolition of criminal colonization; the liberal Siberian press, encouraged by the support of these high officials, has assailed the exile system with renewed courage and vigor; and the Tsar's ministers have been forced at last to consider once more the expediency, not of abolishing the exile system as a whole, but of so modifying it as to render it less burdensome to the inhabitants of a rich and promising colony. In giving the subject such consideration the Government is not actuated by humane motives—that is, by a desire to lessen the enormous amount of misery which the exile system causes; it wishes merely to put a stop to annoying complaints and protests, and to increase the productiveness and tax-paying capacity of Siberia. In approaching the question from this point of view, the Government sees that the most irritating and burdensome feature of the exile system is the colonization of common criminals in the Siberian towns and villages. It is this against which the Siberian people protest, and it is this which lessens the productive capacity of the colony. Other features of the system are more cruel,—more unjust and disgraceful,—but this is the one which makes most trouble, and which, therefore, must first have attention.

Just before I left St. Petersburg for the United States on my return from Siberia, I took breakfast with Mr. Galkin-Vrasskoi, the Chief of the Russian Prison Department, and had a long and interesting conversation with him concerning the exile system and the plan of reform which he was then maturing, and which is now said by the London "Spectator" to involve the entire abolition of exile to Siberia as a method of punishment. The view of the question taken by Mr. Galkin-Vrasskoi at that time was precisely the view which I have indicated in the preceding paragraph. He did not expect to bring about the abolition of the exile system as a whole, nor did he intend to recommend such a step to the Tsar's ministers. All that he proposed to do was so to restrict and reform the system as to make it more tolerable to the Siberian people. This he expected to accomplish by somewhat limiting communal exile, by abolishing criminal colonization, and by increasing the severity of the punishment for vagrancy. The reform was not intended to change the status of hard-labor convicts, nor of administrative exiles, nor of political; and Mr. Galkin-Vrasskoi told me distinctly that for political convicts a new prison was then building at the famous and dreaded mine of Akatui, in the most lonely and desolate part of the Trans-Baikal. Of this fact I was already aware, as I had visited the mine of Akatui, and had seen there the timber prepared for the building. It was the intention of the Government, Mr. Galkin-Vrasskoi said, to pump out the abandoned Akatui mine, which was then half full of water, and set the politicals to work in it.

At the time of our conversation Mr. Galkin-Vrasskoi did not regard the complete abolition of the exile system as even possible, much less practicable. He estimated that it would cost at least ten million rubles to build in European Russia the prisons which the abolition of the exile system would necessitate, and he did not think that, in the straitened condition of the Russian finances, it would be possible to appropriate such

an amount for such a purpose. Furthermore, the complete abolition of the system would make it necessary to revise and remodel the whole penal code, and to this step objections would probably be raised by the Minister of Justice. Under such circumstances, all that the Prison Department hoped to do was to make such changes in the system as would render it less objectionable to the Siberian people and less burdensome to the commercial interests of an important colony.

Since my interview with Mr. Galkin-Vrasskoi, the scheme of reform which he then had under consideration has been completed, and, if it has not been "put under the table-cloth," it is now awaiting the action of the Council of State. I have every reason to believe that no material change has been made in it since I discussed it with its author. Its provisions have been published repeatedly in the Siberian newspapers, and as recently as May of the present year the "Russian Courier" printed an abstract of it by sections. The plan is, in brief:

First. To substitute imprisonment in European Russia for forced colonization in Siberia, and to retain the latter form of punishment only "for certain offenses" and "in certain exceptional cases." The "Spectator" may have taken this to mean that the whole exile system is to be abolished; but if so, it misunderstands the words. The meaning is, simply, that one class of exiles—namely, "poselents," or compulsory colonists—are hereafter to be shut up in European Russia, unless, "for certain offenses" and "in certain exceptional cases," the Government shall see fit to send them to Siberia as usual. This reform would have affected in the year 1885 only 2841 exiles out of a total number of 10,230.

Second. The plan proposes to increase the severity of the punishment for vagrancy by sending all vagrants into hard labor on the island of Saghalien. This section is aimed at runaway convicts, thousands of whom spend every winter in prison and every summer in roaming about the colony.

Third. The plan proposes to deprive village communes of the right to banish peasants who return to their homes after serving out a term of imprisonment for crime. This is a limitation of the exile system as it now exists, and in 1885 it would have affected 2651 exiles out of a total of 10,230.

Fourth. The plan proposes to retain communal exile, but to compel every commune to support, for a term of two years, the persons whom it exiles. The amount of money to be paid for the support of such persons is fixed at \$18.25 a year per capita, or five cents a day for every exile. To what extent this would, in practice, operate as a restriction of communal exile, I am unable to say. The "Siberian Gazette," in a recent number, expressed the opinion that it would affect it very slightly, and attacked the plan vigorously upon the ground of its inadequacy.

Fifth. The plan proposes to modify sections 17 and 20 of the penal code so as to bring them into harmony with the changes in the exile system above provided for.

This is all that there is in the scheme of reform submitted by the Prison Department to the Tsar's ministers. It is, of course, a step in the right direction, but it comes far short of a complete abolition of the exile system, inasmuch as it does not touch the banishment to Siberia of political offenders, nor the transpor-

tation of hard-labor convicts to the mines, nor the deportation of religious dissenters; and it restricts communal exile only to a very limited extent. The plan has been discussed at intervals by the Russian newspaper press ever since the return of Mr. Galkin-Vrasskoi from his Siberian journey of inspection, and I have yet to see the first hint or intimation that the Prison Department has even so much as suggested the entire abolition of the exile system. The plan which Mr. Galkin-Vrasskoi outlined to me is precisely the plan which, according to the Russian and Siberian newspapers, is now pending.

The only question which remains for consideration is, Will this limited measure of reform be adopted? In my judgment it will not be. Before such a plan as this goes to the Council of State for discussion, it is always submitted to the ministers within whose jurisdiction it falls—in the present case to the Minister of Justice, the Minister of Finance, and the Minister of the Interior. Two of these officers have already disapproved the plan of the Prison Department, in whole or in part, upon the ground that it is impracticable, or that it goes too far. The Minister of Finance opposes it *in toto*, and says that "the reasons assigned by Mr. Galkin-Vrasskoi for the proposed changes in the exile system are not sufficiently convincing." I have not space for Mr. Vishnegradski's argument against the reform, but it may be found in the "Siberian Gazette," No. 34, p. 4, May 20, 1888. The Minister of Justice declares that the proposed reform cannot be carried out "without the essential destruction of the whole existing system of punishment for crime"; and that "the substitution of imprisonment in European Russia for colonization in Siberia is impossible." Furthermore, he goes out of his way to say that "exile to Siberia for political and religious offenses must be preserved." ("Eastern Review," p. 11, St. Petersburg, April 22, 1888.)

Of course, the opposition of two powerful ministers is not necessarily fatal to a measure of reform of this kind; but, since in the present case they are the ministers who are most directly interested, their influence is very strong, and if they be supported by the Minister of the Interior they will almost certainly be able to withhold Mr. Galkin-Vrasskoi's plan from the Council of State. They will simply "put it under the table-cloth," and report to the Tsar that they find it utterly impracticable.

If this were the first time that the question of Siberian exile had been agitated, and if this were the first measure of reform that had been submitted to the Tsar's ministers, there might be some reason to hope for a change in the existing situation of affairs; but it is an old, old story. Abler men than Galkin-Vrasskoi have condemned the exile system and have submitted plans of reform; stronger governors-general than Ignatief and Korff have insisted upon the abolition of criminal colonization; but their efforts have always been fruitless, and their plans have always been found "impracticable." After such an investigation of the exile system as I have recently made, I hope with all my heart that it may be abolished, and I shall do all that lies in my power; but I greatly fear, nevertheless, that it will remain, for many years, one of the darkest blots upon the civilization of the nineteenth century.

George Kennan.

General Grant and Matias Romero.

GENERAL ADAM BADEAU published in *THE CENTURY* for October, 1885, an article entitled "The Last Days of General Grant," in which he said:

"About the same time Mr. Romero, the Mexican minister, who had been a valued friend from the period when the French were driven from Mexico, came on from Washington, and insisted on lending him \$1000. At first the General declined the offer, but Mr. Romero suddenly quitted the room, leaving his check for \$1000 on the table. But for these succors the man who had dined with half the kings of the earth would have wanted money to buy bread for himself and his children."

I presume General Badeau based his statement on an article published by "The Mail and Express" of New York on Saturday, February 7, 1885, which contained, to my knowledge, the first publication of that incident ever made.

Although the statement contained in the preceding quotation is not accurate, I refrained from rectifying it when it was published, mainly because I did not wish to wound any one's susceptibility, and much less that of General Grant's family, as also on account of my natural reluctance to bring myself forward before the public, and because the inaccuracies were only of a secondary character, although reflecting, to a certain degree, on me, since they represented me as forcing General Grant to do a thing which was repugnant to him. But friends of the General and of myself have advised me of the convenience of rectifying the historical facts of this incident, and I have, therefore, determined to make the following statement of what really took place.

The banking house of Grant & Ward of New York, of which General Grant was a partner, failed on the 6th of May, 1884; and believing that said event would place the General under serious embarrassment, I thought that my personal relations with him required my visiting him, and I therefore left Washington on the 9th of that month for New York for the purpose of expressing to him, in person, my sympathy and concern in the difficult circumstances through which he was passing. I had, on the 12th, an interview with General Grant at his residence, No. 3 East 66th street, in the city of New York, and he informed me that all he possessed had been lost in the broken bank; even the interest on a fund of \$200,000 which several New York gentlemen had raised for the purpose of giving him an income which would permit him to live decently had been negotiated previously by Ferdinand Ward, and that six months or a year would elapse before he could rely on the interest of said fund. Mrs. Grant was in the habit, he said, of drawing from the bank, a few days after the first of each month, the necessary amount to pay the house bills for the previous month; but in May, 1884, she had not yet drawn the sum required for that purpose, before the failure of the bank. They found themselves, therefore, without the necessary means to do their own marketing (these were his own words). The only amount they had at the house was, he said, as I recollect, about \$18.

Surprised at hearing the above statement, I told General Grant that he well knew I was not a rich man, but that I could dispose of three or four thousand

dollars, which were at once at his disposal; that I would not need them soon, and that he need, therefore, not be in any hurry concerning the time when he ought to pay them back, and that they of course would draw no interest.

General Grant hesitated somewhat before accepting my offer, for fear, as he said, that this loan would put me to some inconvenience, but told me, at last, that he would borrow one thousand dollars. I asked him whether he wanted said amount in a check drawn by me on the New York bank where I had my funds, or in bank bills; and in the latter case, bills of what denomination he desired. He replied that he preferred ten \$100 bills, and I then drew at once a check (No. 406) to my order for \$1000, which was cashed at the bank of Messrs. Drexel, Morgan & Co. of the city of New York, with ten \$100 bills; and I returned on the same day to General Grant's house and personally delivered the money to him.

I came back to Washington on the 15th of May, and here a few days later I received from General Grant \$436 in part payment of the loan of \$1000 made to him on the 12th. On the 24th of the following June I received a letter from the General, dated at Long Branch the day before, inclosing a check of Messrs. Hoyt Brothers on the Park National Bank of New York, to the order of Mrs. Grant, for the sum of \$564; so that the loan was fully repaid but a few days after it was made.

Not to wound General Grant's susceptibility, I never breathed a word on this subject to anybody, not even to the most intimate members of my family, and through me nobody would ever have known anything about it.

However great was my desire to help General Grant through the difficult circumstances which he then underwent, I would never have done so against his full consent; and if he had manifested any reluctance to receive the pecuniary aid I offered him I would not have insisted on it, as I did not wish to oppose his will in the least, and much less to force him to accept pecuniary aid.

M. Romero.

WASHINGTON, D. C., May 22, 1888.

The Canal at Island No. 10.

[THE letters which follow are of interest in connection with the reference to the discussion of the subject by Messrs. Nicolay and Hay on page 659 of the present *CENTURY*.—EDITOR.]

IN *THE CENTURY* for September, 1885, there is an article headed: "Who Projected the Canal at Island Number 10?" by General Schuyler Hamilton, written to establish his claim to the honor of having originated the idea of the canal across the bend at New Madrid, whereby the fortifications on Island No. 10 were cut off, with the result of their capture by General Pope. General Hamilton, writing of Colonel J. W. Bissell's description of the work, in this magazine for August, 1885, says:

To the public this reads as though the plan originated with Colonel Bissell, while I am ready to show that while the colonel directed the work, "some officer," as he says,—or, to be exact, I myself,—was the sole inventor of the project.

The general then quotes further to show that the idea originated or was "advanced" by him March 17, 1862.

Both these gentlemen are in error regarding the fact as to who originated the design of this canal. To divest myself of seeming egotism I will use the general's own words: "To be exact, I myself was the sole inventor of the project," having drawn in detail the plan of this canal and particularly described the *modus operandi* of its construction on the 20th of August, 1861, more than *six months* before the canal was cut. This description, with the charts, I sent to General Frémont, who was then preparing his campaign down the Mississippi. The following is his appreciative acknowledgment of the reception of my charts:

HEADQUARTERS WESTERN DEPARTMENT,
ST. LOUIS, September 6, 1861.

MR. JOHN BANVARD,
Cold Spring, Long Island.

SIR: I have received your letter of the 22d ult. with its valuable inclosures. I shall be glad to see your portfolio of drawings, and have no doubt but that I shall find them very useful in my coming campaign down the river.

Accept my thanks for your thoughtful consideration and be assured that it is appreciated by

Yours truly,
J. C. FRÉMONT,
Major-General Commanding

Some years before, I had made, with the idea of publishing them for the use of boatmen, a hydrographic series of charts of the entire river below Cairo, the old ones then in use on the river being very defective. These I also tendered to General Frémont.

It will be remembered that General Frémont was succeeded by General Hunter. Mr. Lossing says in his history: "When General Hunter arrived at headquarters, Frémont, after informing him of the position of affairs, laid before him all his plans." (Lossing's Hist., Vol. II., p. 84.) From this it is evident that my charts and plans were handed over to the new command and eventually utilized at New Madrid, and if there is any honor attached to the originality of the idea, it belongs to your humble servant,

John Banvard.

LAKE KAMPESKA, WATERTOWN, DAKOTA, Sept. 7, 1885.

P. S. As an interesting addendum to this subject of military canals of the Mississippi, I perhaps might say further that I also sent General Grant some useful hints regarding the canal at Vicksburg which he attempted to make. Fearing that through the vicissitudes of camp life he might fail to receive my communications, I sent this to "The New York Times," in which it was printed, the editor calling especial attention to the importance of the article:

TO THE EDITOR OF "THE NEW YORK TIMES":

I see the engineers have failed to cut the canal through the bend at Vicksburg, and that the Southern people are laughing over the event. I have seen just such failures before on the Mississippi. Captain Shrieves, who was employed by Government to improve the navigation, made the same mistake in his attempt to open the Horse Shoe Bend in 1836. I could take a couple hundred of hands and have the old Father of Waters flowing across the bend at Vicksburg in three days. Tell those who have the work in charge to *cut through that argillaceous stratum* they have come to (I know they have encountered it, although it has not been mentioned),—cut through this until they reach the substratum of sand, and the river will go through, even if the ditch through the clay is not over a foot in width.

The Mississippi "bottom" is formed, first of sand, next of this argillaceous formation, and above, the alluvium. In some places I have seen this argillaceous formation not over a foot thick, and it may be so at Vicksburg; and it is rarely over six feet in thickness. However, *cut through it,*

and as long as sand possesses its natural capillary attraction, nothing under heaven can stop the river from going through the cut, as the sand will wash out, undermining this superstratum of stiff clay when the superincumbent alluvium falls with it, and within twenty-four hours—mark my words—a steamer can pass through the new channel. In some places this argillaceous formation does not exist at all, as the case at Bunches's Bend, where the bend was opened in the morning by a mere ditch and steamers passed through by night, so rapidly did the banks wash away.

Yours,
JOHN BANVARD.

Mr. Banvard's letter to the Editor of THE CENTURY having been submitted to General Frémont, for his comment, he wrote as follows:

NEW YORK, September 28, 1885.

MY DEAR SIR: . . . The plans submitted to me by Mr. Banvard were carefully examined in connection with the Mississippi River campaign upon which we had entered agreeably to the plan submitted by me to President Lincoln under date of September 8, 1861, and, in that part relating to the Tennessee and Cumberland rivers, also to General Sherman.

My letter in answer to Mr. Banvard shows that I held his plans to be very important. They were directly in aid to Admiral Foote and the gun-boat work, and fitted into the part I had assigned to General Grant in the plan of campaign I had submitted to the President. In this I had proposed that "General Grant should take possession of the entire Cairo and Fulton railroad, Picketon, New Madrid, and the shore of the Mississippi opposite Hickman and Columbus."

It was in this connection that Mr. Banvard's plans became immediately useful.

These plans are not now in my possession. In obedience to orders from the War Department, directing that all papers concerning the Western Department should be delivered immediately to General Halleck, they were at once turned over to him.

There was no opportunity given to single out and return to their rightful owners documents properly belonging to them.

In this way Mr. Banvard's papers were necessarily left among the memoranda of the proposed campaign, and could not have failed to attract attention in connection with the work of the gun-boats.

Much of interest might be said in connection with this subject. But to avoid delay I have confined myself to a direct reply to your question as to what I "know of the justice of Mr. Banvard's claim to the origination of the canal at Island No. 10."

With my knowledge of the above facts, and the impression remaining on my mind, I have no hesitation in saying that I believe Mr. Banvard's claim to be absolutely just.

Yours truly,
J. C. FRÉMONT.

To the Editor of THE CENTURY MAGAZINE.

Art Education.

THE most casual education in art will enable any intelligent observer to recognize the wide difference in the qualities of the art of the great revival of the fourteenth to the sixteenth centuries and that of to-day, in any school, and of any form. This difference is not merely one of motive—the change from a religious theme to every-day incident is not one which touches the technical side of art at all—nor is it any more in any natural gifts in the painter of the Renaissance not now possessed; not even in profounder religious feeling, which was in the greatest art period as exceptional as it is now, and which was never so potent over the art of the great technicians like Michael Angelo, Veronese, Titian, and Correggio as in that of the weaker men like Fra Angelico and the Mystics. The ascetic spirit characteristic of ecclesiastical art has always been adverse to the highest development of art, which only reached its climax under the freedom induced by a recognition

of the value of pagan liberty. But while music has steadily developed its resources, increased its range and power, retaining and deepening its hold over the human mind, painting has as steadily receded into a position in all respects inferior as art, though in some directions far more influential as the guide to nature-study.

The exceptional minds of the great Renaissance are exceptional still—for a Michael Angelo we have a Millet; for a Titian we have a Turner; for Giorgione, a Rossetti; for Correggio, a Reynolds and a Gainsborough, inferior in no respect of intellectual power, even in some cases superior. Yet in visiting the great European galleries no one who understands the technical merits of painting or sculpture can fail to be impressed with the number of painters there represented whose names are almost unknown, and whose positions in the great schools were those of a decided and neglected inferiority, but whose work shows power and technical mastery which would now place any man among the first of contemporary painters. The examples which we find in the Italian galleries of pictures of the Venetian and Bolognese schools, whose painters we cannot determine in many cases and in many others only know that they were pupils of well-known masters, are sometimes of such power of drawing and execution that we can only repeat, "There were giants in the earth in those days." The most powerful painter of our day, of any school, when measured by Velasquez, Rubens, Rembrandt, Tintoret, Veronese, Titian, Raphael, Michael Angelo, Correggio, or, coming down in the scale, even with the Carracci and Guido Reni, is dwarfed in every technical attainment.

Why is it? It is not from intellectual inferiority—men like Delacroix, Millet, Rossetti, Watts, Burne-Jones, Leys, Turner, Israels do not fall below the average of the mental power of any of the greatest schools. Nor will any lack of moral exaltation explain it, for, with few exceptions, the great painters of the fifteenth and sixteenth centuries were not moralists—still less purists. I asked Delacroix one day wherein lay this modern inferiority, and he placed it in the want of executive ability, and prescribed copying the great masters as the remedy, which he himself had tried, but with what success we all know; for with all his great imagination and gifts he fails only a little less than others, and his weakest point, in his best period, is the glibness of too facile touch, the subtlety of which is in no relation to its facility. Millet and Turner alone of moderns have that invariable command of form which makes their quickest work their best, or at least never inferior; but the great Italians were equally sure, whether working with speed or at leisure. It is reserved for modern art-charlatany to simulate with grievous painstaking the appearance of rapidity. And there is no evidence whatever that the great masters, except in a few cases of the sixteenth century, copied as a means of study. Delacroix's remedy is not deep enough, for it will not account for Titian, Francia, Da Vinci.

The system of art education in the earliest time seems to have been not only more secure but far more comprehensive than ours. The young painters went into the masters' studios at the age of from seven to ten, an age at which we now put children to study who desire to make a profession of music; and the need is as great in one case as in the other, for the flexibility of

hand—and, what is more important, the early habit of the muscles following the volition without laborious or anxious exertion of the will—can only be achieved in one case and in the other by the training begun in extreme youth. Nor was this all: they seem to have been taught modeling or drawing indifferently, architecture, and even in some cases literature (Giotto was set by his master at Latin at once); they drew for years on their masters' pictures, traced, painted unimportant parts, worked together with the unfailing effect of mutually brightening their intellects and widening their mental range. Art was to them, in a larger or lesser sense, their lives and their education: the studio, followed up by the intellectual association with the thinkers and poets their contemporaries, was their university; and what we know of their lives and their works goes to show that they kept abreast of their times, and that their larger art was in great part due to their wider mental development through the only educator—interchange of thought.

What chance have we to compete with men who were trained in such a school? We begin late and pride ourselves in our self-sufficiency and self-taught blundering. Those who can, contrive to get a few lessons, mostly from people knowing little more than themselves—not in the philosophy or scope of art, but in the use of pigments; at most a year or two in a French atelier, where the Bohemian may easily overrun and choke the artist, where any habits except those of intellectual activity and thought are acquired, yet a certain amount of *chic*, and are stamped with the image and superscription of their idol and exemplar of the day, and graduate as soon as they get a picture in the Salon. What is their education in the larger sense—how many of them know the contemporary poets, to say nothing of Plato and the older ones?—what part could they take in the intellectual movement of their day? Is it not, on the other hand, the fact that the majority of them care only for the qualities which catch the eyes of the buying and uneducated public, and which content them to the end of their art, which is almost invariably in a decline towards mere mechanical and exaggeratory personal qualities, vagaries, and eccentricities, brilliant execution, finishing in glittering or morbid mannerisms and inane repetitions of motives which were never serious and are often utterly frivolous? As to the general education, the larger and equal intellectual development which we dispense with in no other profession and in very few trades, there is not only no general tendency to it, but in a majority of cases our modern men pride themselves on the narrowness of their training, and consider that the shallower they are found the broader they really are. Having no knowledge of the greater principles of art, they plume themselves on not working after theories, and more vigorously claim inspiration the less they are capable of using their brains, as if art were a jugglery which was the better the less thought had part in it.

The remedy? Education. Treat art as we treat all other human occupations, and dismiss the idea that a profession which demanded special natural qualification, the most arduous training, and an all-round development in its best days, can be picked up like tricks in cards in these times. Training of the hand alone is futile. For many years I believed that art education was to be looked for from France alone: I have tried

the schools of Paris long enough to see that the system corrupts and makes abortive by far the greater number of those who try it. Its curriculum is too narrow for the intellectual life — too corrupt for the moral. Few men survive its influences, and how can we entertain the idea of exposing to its dangers our daughters who now must learn?

We want an art university in which the purely technical facility of hand and eye, which must be attained in youth, and generally in extreme youth, as in music, is cared for as the specialty of the course; where the intellectual enlargement shall be never lost sight of; where the theory of art, its science, its history, all that is known of its spirit and manipulation, must be carefully studied and appropriated, and at the same time the general influence of the literary life in its subjective aspect — philosophy, poetry, history, all that widens and deepens the character and gives it dignity and that purpose which is one of the most important elements of morality. The deeper in the character art is rooted, and the wider the range of its roots in their reach for sustenance and support, the greater and more durable its fruits. The purely scientific studies I do not believe to be necessary to the artist. Art has to deal with the subjective side of nature, science with its objective. The former sees only what the heart wishes to see, the latter determines to see and know all that is and every phase of it. The highest use of any created thing to the one is its beauty; to the other, its function; and these have nothing in common so far as art is concerned. Pure science, even geology and anatomy, I believe to have a hardening and blinding tendency on the artistic perceptions. All other branches of mental culture have their place in our university course, and even the positive sciences in their moral and greater intellectual relations as part of its supreme philosophy, though not as special study.

I believe too that the importance of masters is greatly overrated. To catch little tricks of execution, methods which shall enable us to begin sooner the manufacture of pictures, the lessons of men who have already developed convenient and expensive conventionalisms may be very useful; and for the learning to draw correctly, an experienced eye and a trained example certainly render great services, which may be, however, exaggerated, as may all employment of methods originated by others. The true style and method for any painter are those which his own thought and mental conformation evolve, and the acquirement of any other is only the retarding of the full use of his proper language. There are no longer any secrets of the studio, to be acquired only of specialists. Hard work and straightforward use of our common materials, as they have always sufficed for the great painters who originated the great schools, so they will suffice for us. I believe that there is more virtue in the association of a number of sympathetic and purposeful students determined to learn, and profiting by the common stock of their knowledge and experience, — helping, criticising, and encouraging each other, — than in the teaching of the cleverest master living; while a merely clever master offers the greatest of dangers — that of injuring or absorbing the individuality of his pupil without imparting any compensating force. The individuality of the artist is the most delicate of all intellectual growths, and can only be perfectly developed in a free all-round light: the shadow of

any protecting greatness makes it one-sided, while the help of associates on an equal footing stimulates a healthy and symmetrical growth. I would not, therefore, put a great painter at the head of the university, but rather a good drawing-master, without great individuality, for the drawing; a good modeler for the school of sculpture; and a sound and careful painter, not a genius or a brilliant specialist, for the instruction in painting — leaving every student free, after acquiring a safe and correct style, in his or her branch, to go on and modify that, and to evolve from it the style or manner which suits his or her social character. Then a supervising faculty of teachers for general intellectual training should hold the reins of the collective government.

A school organized on such a plan would certainly arrive at the highest results our material permits and would not be subject to the fate of all the great schools hitherto — the overshadowing influence of a great master, who absorbs by his magnetic attractions all the artistic life of his followers and reduces them to an assimilated school of imitators, pursuing a vein of art which is not their own. If any future is to be found for American art as opposed to the characterless repetition of foreign thought, I am convinced that it must be got at through this path, followed unflinchingly and as long as need be. Such a school should be established far away from the social attractions and distractions of a great city, and if possible under the shadow of a literary university, where the lectures, library, and general intellectual tone of life may aid in strengthening and keeping up the purpose of life and activity, and where the true purpose of education shall not be interfered with by the premature rushing into notoriety, and where the plaudits of an ignorant public shall not seduce the young artist from the grave and laborious pursuit of excellence founded on the basis of a complete and general education. The people who hope to become artists with a dozen lessons in oils or water color, who want to learn to paint before they know how to draw, whose ambition rests on chair-backs, crevel-work, and the hundred and one forms of amateur art which flood the country to-day, will not profit by our university, nor will they to whom art is but a minister to their vanity; but every one to whom art is a serious thing, something worth giving one's life to in unflinching endeavor, will find my scheme more or less accordant to his or her aspirations.

W. J. Stillman.

College Fraternities.

OTHERS can give a more accurate opinion than I upon college fraternities elsewhere; but so far as Amherst is concerned, there can be only a favorable judgment concerning them by any one well informed. Without a doubt they exercise here a wholesome energy, both upon their individual members and upon the college. Combination is strength, whether with young men or old; and where men combine for good ends better results may, of course, be looked for than where the same ends are sought by individuals alone.

Now the aim of these societies is certainly good. They are not formed for pleasure simply, though they are one of the most fruitful sources of pleasure in a

student's college life. Their first aim is the improvement of their members—improvement in literary culture and in manly character. They are all of them literary societies. An effort was made not long since to introduce among us a new society, with prominently social rather than literary aims; but it not only failed to receive the requisite assent of the president of the college, but was not favored by any considerable number of the students, many of whom stoutly opposed it.

One of the happiest features of society life at Amherst is connected with the chapter-houses. There are no better residences in the villages than these, and none are better kept. They are not extravagant, but they are neat and tasteful; they have pleasant grounds surrounding them, the cost of rooms in them is not greater than the average cost in other houses, and they not only furnish the students occupying them a pleasant home, but the care of the home and its surroundings is itself a culture.

There need be no objection to these societies on account of their secrecy. The secrecy is largely in name; is, in fact, little more than the privacy proper to the most familiar intercourse of families and friends. Treated as the societies are among us, and occupying the ground they do, no mischief comes from their secrecy. Instead of promoting cliques and cabals, in point of fact we find less of these than the history of the college shows before the societies came. The rivalry between them is a healthy one, and is conducted openly and in a manly way.

The societies must give back to the college the tone they have first received. I am persuaded that in any college where the prevailing life is true and earnest the societies fed by its fountain will send back bright

and quickening streams. They certainly give gladness and refreshment to our whole college life at Amherst.

AMHERST COLLEGE, June, 1888.

Julius H. Seelye.

Notes on "We-uns" and "You-uns."

IN THE CENTURY for July I notice an article from the pen of L. C. Catlett of Virginia, denying that the people of his State ever made use of the expressions "we-uns" or "you-uns."

During the years 1862 and 1865 I heard these expressions used in almost every section.

At the surrender of General Lee's army, the Fifth Corps was designated by General Grant to receive the arms, flags, etc., and we were the last of the army to fall back to Petersburg, as our regiment (the 6th Pennsylvania Cavalry) was detailed to act as provost-guard in Appomattox Court-House.

As we were passing one of the houses on the outskirts of the town, a woman who was standing at the gate made use of the following expression:

"It is no wonder you-uns whipped we-uns. I have been yer three days, and you-uns ain't all gone yet."

QUAKERTOWN, PA.

George S. Scythes.

IF Mr. Catlett will come to Georgia and go among the "po' whites" and "piney-wood tackeys," he will hear the terms "we-uns" and "you-uns" in every-day use. I have heard them, too, in the Cumberland Valley and other parts of Tennessee, and, unless my memory fails me, in South Carolina. Also, two somewhat similar corruptions, namely, "your-all" and "our-all," implying possession; as, "Your-all's house is better than our-all's."

AUGUSTA, GEORGIA.

Val. W. Starnes.

BRIC-À-BRAC.

His Mother.

SHE thought about him days and nights,—
Her only son,—her sleep oft losing;
She viewed him in so many lights
The mingled beams became confusing.
His budding powers each hour enhanced
The fears, her heart forever paining,
Lest on mistaken lines advanced
His mental and his moral training.

With prescience of his growing need,
She pored o'er every scheme presented,
And tried, in teaching him to read,
Seven several systems late invented.
Each game he learned was but a veil
For information's introduction;
Each seeming-simple fairy-tale
She barbed with ethical instruction.

And oft she said, her dear brown eyes
With tender terror wide-expanded,
"Oh, I must strive to grow more wise!
Think, think, what care is here demanded!
How dreadful, should my teaching's flaws,
My unguessed errors subtly harm him,
Or Fortune's arrows wound because
His mother failed in proof to arm him!"

And yet, when that young boy,—whose look
Was like some fair boy-prince, as painted
By rare Vandyke,—his soul a book
By blot of falsehood quite untainted,
Inquired, "Mamma, what 's veal?" with mild
Untroubled smile, in accents clearest,
She told that little, trusting child,
"The woolly, baby sheep, my dearest!"

Helen Gray Cone.

Uncle Esak's Wisdom.

MY friend, if you are happy, don't try to prove it.

THE man who deserves a monument never needs one, while the man who needs one never deserves it.

HE who undertakes to live by his wits will find the best chances already taken.

WIT inclines naturally towards satire, and humor towards pathos.

MUCH as we deplore our condition in life, nothing would make us more satisfied with it than the changing of places, for a few days, with our neighbors.

ALL the nations of the earth praise liberty, and still they seem to be uneasy until they lose it.

How can we ask others to think as we do, when tomorrow we probably shall think differently ourselves?

WITH all her natural modesty, woman has less bashfulness than man.

JUSTICE is every man's due, but would ruin most people.

OPINIONS quite often are a mere compromise between what a man does n't know and what he guesses at.

THERE is nothing that has been praised or abused more than liberty.

THOSE who live to be a century old are generally most remarkable for nothing else.

To be a successful fool, a man must be more wise than foolish.

Uncle Essek.

A Confession.

Do you remember, little wife,
How years ago we two together
Saw naught but love illumine life
In sunny days or winter weather?

Do you recall in younger years
To part a day was bitter pain?
Love's light was hid in clouds of tears
Till meeting cleared the sky again.

Do you remember how we two
Would stare into each other's eyes,
Till all the earth grew heavenly blue
And speech was lost in happy sighs?

Do you another thing recall,
That used to happen often then:
How simply meeting in the hall,
We'd stop to smile and kiss again?

Do you remember how I sat
And, reading, held your hand in mine,
Caressing it with gentle pat—
One pat for every blessed line?

Do you recall how at the play
Through hours of agony we tarried?
The lovers' griefs brought us dismay;
Oh! we rejoiced when they were married;

And then walked homeward arm in arm,
Beneath the crescent moonlet new,
That smiled on us with silent charm;
So glad that we were married too.

Ah me! 't was years and years ago
When all this happened that I sing,
And many a time the winter snow
Has slipped from olive slopes of spring.

And now—oh, nonsense! let us tell;
A fig for laugh of maids or men!
You 'll hide your blushes? I 'll not. Well—
We're ten times worse than we were then.

W. J. Henderson.

A Vis-à-Vis.

ACROSS the street I look and see
A face whose graceful outline
Makes my poor beating heart to be
A trout upon love's trout-line.
The gauzy curtains half eclipse
This star of girlish creatures,
Yet oft I catch a smile that slips
In ripples o'er her features.

And through my window oftentimes,
While I alone am sitting,
Lost in a labyrinth of rhymes,
I find a sunbeam flitting
Across the sheet whereon I write,
Like some golden-haloed spirit:
And though her face is out of sight,
Her soul, I know, is near it.

Her presence makes the laggard ink
Run happily to greet her;
I never have to pause to think
Of proper rhyme or meter;
If 't is a word I need, one glance
At her fair features puts it
Upon the sheet in rhythmic dance
Where fancy lightly foots it.

O charming Vis-à-Vis of mine,
Who lighten so my labors,
I would that you might draw the line
And make us nearer neighbors.
To keep my simile: the fish
Would willingly be taken;
The tempting bait but makes him wish
To leave his friends forsaken.

Again across the street I look,
Alas, you've drawn the curtain,
And I am left upon the hook
Of sentiment uncertain;
Compelled to leave my rhyme and live
In shadow and confusion,
Until once more you come to give
The light of a conclusion.

Frank Dempster Sherman.

To a Poet in "Bric-à-Brac."

WHEN we, the ungifted of our time,
Who dare not up Parnassus climb,
And cannot even make a rhyme
"With pen and ink,"
Take up THE CENTURY, fresh from press,
To what page first—just try to guess—
Turn we with greatest eagerness?
What do you think?

Believe me, we completely slight
The poets of the loftiest flight,
Whose Pegasus soars out of sight
Of common eyes:
The page we turn to is the last;
Its themes are not too deep and vast;
Its poets, though they've been surpassed,
Are not too wise.

So, though your muse is never seen
"Within the solid magazine,"
Though on your prayer for loftier theme
She turns her back,
Grieve not—more honored poets yet
May haply wish their verse was set
Within the dainty cabinet
Of Bric-à-Brac.

THE CENTURY MAGAZINE.

VOL. XXXVI.

OCTOBER, 1888.

No. 6

HERE is an old park wall which follows the highway in all its turns with such fidelity of curve that for some two miles it seems as if the road had been fitted to the wall. Against it hawthorn bushes have grown up at intervals, and in the course of years their trunks have become almost timber. Ivy has risen round some of these, and, connecting them with the wall, gives them at a distance the appearance of green bastions. Large stems of ivy, too, have flattened themselves upon the wall, as if with arched back they were striving like athletes

to overthrow it. Mosses, brown in summer, soft green in winter, cover it where there is shadow, and if pulled up take with them some of the substance of the stone or mortar like a crust. A dry, dusty fern may perhaps be found now and then on the low bank at the foot—a fern that would rather be within the park than thus open to the heated south with the wall reflecting the sunshine behind. On the other side of the road, over the thin hedge, there is a broad plain of cornfields. Coming from these the laborers have found out, or made, notches in the wall; so that, by putting their iron-plated toes of their boots in, and holding to the ivy, they

can scale it and shorten their long trudge home to the village. In the spring the larks, passing from the green corn to the pasture within, fluttering over with gently vibrating wings and singing as they daintily go, sometimes settle on the top. There too the yellow-hammers stay. In the crevices bluetits build deep inside passages that abruptly turn, and baffle egg-stealers. Partridges come over with a whirl, but just clearing the top, gliding on extended wings, which to the eye look like a slight brown crescent. The wagoners who go by know that the great hawthorn bastions are favorite resorts of wood-pigeons and missel-thrushes. The haws are ripe in autumn and the ivy berries in spring, so that the bastions yield a double crop. A mallow the mauve petals of which even the dust of the road cannot impair flowers here and there on the dry bank below, and broad moon-daisies among the ripe and almost sapless grass of midsummer.

If any one climbed the wall from the park and looked across at the plain of cornfields in early spring, everywhere there would be seen brown dots in the air—above the first slender green blades; above the freshly turned

all unable to set forth their joy. Swift as is the vibration of their throats, they cannot pour the notes fast enough to express their eager welcome. As a shower falls from the sky, so falls the song of the larks. There is no end to them: they are everywhere; over every acre away across the plain to the downs, and up on the highest hill. Every crust of English bread has been sung over at its birth in the green blade by a lark.

If one looked again in June, the clover itself, a treasure of beauty and sweetness, would be out, and the south wind would come over acres of flower—acres of clover, beans, tares, purple trifolium, far-away crimson saintfoin (brightest of all on the hills), scarlet poppies, pink

TURTLE-DOVES IN STUBBLE.

dark furrows;
above the distant
plow, the share of which,
polished like a silver mirror by friction with the clods, reflects the sunshine, flashing a heliograph message of plenty from the earth; everywhere brown dots, and each a breathing creature—larks ceaselessly singing, and

convolvulus, yellow charlock, and green wheat coming into ear. In August, already squares would be cut into the wheat, and the sheaves rising, bound about the middle, hour-glass fashion; some breadths of wheat yellow, some golden-bronze; beside these, white barley and oats, and beans blackening. Turtle-doves would be in the stubble, for they love to be near the sheaves. The hills after or during rain look green and near; on sunny days, a far and faint blue. Sometimes the sunset is caught

FALLOW DEER.

in the haze on them and lingers like a purple veil about the ridges. In the dusk hares come heedlessly along; the elder-bushes gleam white with creamy petals through the night.

Sparrows and partridges alike dust themselves in the white dust, an inch deep, of mid-summer, in the road between the wall and the corn—a pitiless Sahara road to traverse at noonday in July, when the air is still and you walk in a hollow way, the yellow wheat on one side and the wall on the other. There is shade in the park within, but a furnace of sunlight without—weariness to the eyes and feet from glare and dust. The wall winds with the highway and cannot be escaped. It goes up the slight elevations and down the slopes;

it has become settled down and bound with time. But presently there is a steeper dip, and at the bottom, in a narrow valley, a streamlet flows out from the wheat into the park. A spring rises at the foot of the down a mile away, and the channel it has formed winds across the plain. It is narrow and shallow; nothing but a larger furrow, filled in winter by the rains rushing off the fields, and in summer a rill scarce half an inch deep. The wheat hides the channel completely, and as the wind blows, the tall ears bend over it. At the edge of the bank pink convolvulus twines round the stalks and the green-flowered buckwheat gathers several together. The sunlight cannot reach the stream, which runs in shadow, deep down below the wheat ears, over which butterflies

wander. Forget-me-nots flower under the banks; grasses lean on the surface; willow herbs, tall and stiff, stand up; but out from the tangled and interlaced fibers the water flows as clear as it rose by the hill. There is a culvert under the road, and on the opposite side the wall admits the stream by an arch jealously guarded by bars. In this valley the wall is lower and thicker and less covered at the top with ivy, so that where the road rises over the

another part of the park nearer the village, with a façade visible from the highway. The old manor-house is occupied by the land-steward, or, as he prefers to be called, the deputy-forester, who is also the oldest and largest tenant on the estate. It is he who rules the park. The laborers and keepers call him the "squire."

Now the old squire's favorite resort is the window-seat in the gun-room, because thence

ROOKS REPAIRING A NEST.

culvert you can see into the park. The stream goes rounding away through the sward, bending somewhat to the right, where the ground gradually descends. On the left side, at some distance, stands a row of full-grown limes, and through these there is a glimpse of the old manor-house. It is called the old house because the requirements of modern days have rendered it unsuitable for an establishment. A much larger mansion has been erected in

he can see a section of the highway, which, where it crosses the streamlet, comes within half a mile of the house. There the hollow and the lower wall permit any one at this window to obtain a view of the road on one of the sides of the valley. At this declivity it almost faces the house, and whether the passers-by are going to the market-town, or returning to the village, they cannot escape observation. If they come from the town, the steep descent compels them to walk their horses down it; if from the village, they have a hard pull up. So the oaken window-seat in the gun-room

is as polished and smooth as an old saddle; for if the squire is indoors, he is certain to be there. He often rests there after half an hour's work on one or other of the guns in the rack; for, though he seldom uses but one, he likes to take the locks to pieces upon a little bench which he has fitted up, and where he has a vise, tools, a cartridge-loading apparatus, and so forth, from which the room acquired its name. With the naked eye, how-

ever, as the road is half a mile distant, it is not possible to distinguish persons, except in cases of very pronounced individuality. Nevertheless old "Ettles," the keeper, always declared that he could see a hare run up the down from the park, say a mile and a half. This may be true; but in the gun-room there is a field-glass, said to have been used at the siege of Seringapatam, which the squire can bring to bear upon the road in an instant, for from constant use at the same focus there is a rim round the tarnished brass. No time, therefore, need be lost in trials; it can be drawn out to the well-known mark at once. The window itself is large, but there is a casement in it,—a lesser window,—which can be thrown open with a mere twist of the thumb on the button, and as it swings open it catches itself on a hasp. Then the field-glass examines the distant wayfarer.

When people have dwelt for generations in one place they come to know the history of their immediate world. There was not a wagon that went by without a meaning to the squire. One perhaps brought a load of wool from the downs: it was old Hobbes's, whose affairs he had known these forty years. Another, with wheat, was Lambourne's team: he lost heavily in 1879, the wet year. The family and business concerns of every man of any substance were as well known to the squire as if they had been written in a chronicle. So, too, he knew the family tendency, as it were, of the cottagers. So and So's lads were always tall, another's girls always tidy. If you employed a member of this family, you were sure to be well served; if of another, you were sure to be cheated in some way. Men vary like trees: an ash sapling is always straight, the bough of an oak crooked, a fir full of knots. A man, said the squire, should be straight like a gun. This section of the highway gave him the daily news of the village as the daily papers give us the news of the world. About two hundred yards from the window the row of limes began, each tree as tall and large as an elm, having grown to its full natural size. The last of the row came very near obstructing the squire's line of sight, and it once chanced that some projecting branches by degrees stretched out across his field of view. This circumstance caused him much mental trouble; for, having all his life consistently opposed any thinning out or trimming of trees, he did not care to issue an order which would almost confess a mistake. Besides which, why only these particular branches?—the object would be so apparent. The squire, while conversing with Ettles, twice, as if unconsciously, directed his steps beneath these limes, and, striking the offending boughs with his stick, re-

marked that they grew extremely fast. But the keeper, usually so keen to take a hint, only answered that the lime was the quickest wood to grow of which he knew. In his heart he enjoyed the squire's difficulty. Finally the squire, legalizing his foible by recognizing it, fetched a ladder and a hatchet, and chopped off the boughs with his own hands.

It was from the gun-room window that the squire observed the change of the seasons and the flow of time. The larger view he often had on horseback of miles of country did not bring it home to him. The old familiar trees, the sward, the birds, these told him of the advancing or receding sun. As he reclined in the corner of the broad window-seat, his feet up, and drowsy, of a summer afternoon, he heard the languid cawing of an occasional rook, for rooks are idle in the heated hours of the day. He was aware, without conscious observation, of the swift, straight line drawn across the sky by a wood-pigeon. The pigeons were continually to and fro the cornfields outside the wall to the south and the woods to the north, and their shortest route passed directly over the limes. To the limes the bees went when their pale yellow flowers appeared. Not many butterflies floated over the short sward, which was fed too close for flowers. The butterflies went to the old garden, rising over the high wall as if they knew beforehand of the flowers that were within. Under the sun the short grass dried as it stood, and with the sap went its green. There came a golden tint on that part of the wheat-fields which could be seen over the road. A few more days—how few they seemed!—and there was a spot of orange on the beech in a little copse near the limes. The bucks were bellowing in the forest; as the leaves turned color their loves began and the battles for the fair. Again a few days and the snow came, and rendered visible the slope of the ground in the copse between the trunks of the trees: the ground there was at other times indistinct under brambles and withered fern. The squire left the window for his arm-chair by the fire; but if presently, as often happens when frost quickly follows a snow-storm, the sun shone out and a beam fell on the wall, he would get up and look out. Every footstep in the snow contained a shadow cast by the side, and the dazzling white above and the dark within produced a blue tint. Yonder by the limes the rabbits ventured out for a stray bunch of grass not quite covered by the drift, tired, no doubt, of the bitter bark of the ash-rods that they had nibbled in the night. As they scampered, each threw up a white cloud of snow-dust behind him. Yet a few days and the sward grew greener. The pale winter hue, departing as the

spring mist came trailing over, caught for a while in the copse, and, lingering there, the ruddy buds and twigs of the limes were refreshed. The larks rose a little way to sing in the moist air. A rook, too, perching on the top of a low tree, attempted other notes than his monotonous caw. So absorbed was he in his song that you might have walked under him unnoticed. He uttered four or five distinct sounds that would have formed a chant, but he paused between each as if uncertain of his throat. Then, as the sun shone, with a long drawn "ca-awk" he flew to find his mate, for it would soon be time to repair the nest in the limes. The butterflies came again and the year was completed, yet it seemed but a few days to the squire. Perhaps if he lived for a thousand years, after a while he would wonder at the rapidity with which the centuries slipped by.

By the limes there was a hollow,—the little circular copse was on the slope,—and jays came to it as they worked from tree to tree across the park. Their screeching often echoed through the open casement of the gun-room. A faint mark on the sward trended towards this hollow; it was a trail made by the squire, one of whose favorite strolls was in this direction. This summer morning, taking his gun, he followed the trail once more.

The grass was longer and coarser under the shadow of the limes, and upborne on the branches were numerous little sticks which had dropped from the rookery above. Sometimes there was an overthrown nest like a sack of twigs turned out on the turf, such as the hedgers rake together after fagoting. Looking up into the trees on a summer's day not a bird could be seen, till suddenly there was a quick "jack-jack" above, as a daw started from his hole or from where the great boughs joined the trunk. The squire's path went down the hollow till it deepened into a thinly wooded coomb, through which ran the streamlet coming from the wheat-fields under the road. As the coomb opened, the squire went along a hedge near but not quite to the top. Years ago the coomb had been quarried for chalk, and the pits were only partly concealed by the bushes: the yellow spikes of wild mignonette flourished on the very edge, and even half way down the precipices. From the ledge above, the eye could see into these and into the recesses between the brushwood. The squire's son, Mr. Martin, used to come here with his rook-rifle, for he could always get a shot at a rabbit in the hollow. They could not see him approach; and the ball, if it missed, did no damage, being caught as in a bowl. Rifles in England, even when their range is but a hundred yards or so, are not to be used with-

out caution. Some one may be in the hedge nutting, or a laborer may be eating his lunch-eon in the shelter; it is never possible to tell who may be behind the screen of brambles through which the bullet slips so easily. Into these hollows Martin could shoot with safety. As for the squire, he did not approve of rifles. He adhered to his double-barrel; and if a buck had to be killed, he depended on his smooth-bore to carry a heavy ball forty yards with fair accuracy. The fawns were knocked over with a wire cartridge unless Mr. Martin was in the way—he liked to try a rifle. Even in summer the old squire generally had his double-barrel with him—perhaps he might come across a weasel, or a stoat, or a crow. That was his excuse; but in fact, without a gun the woods lost half their meaning to him. With it he could stand and watch the buck grazing in the glade, or a troop of fawns—sweet little creatures—so demurely feeding down the grassy slope from the beeches. Already at midsummer the nuts were full formed on the beeches; the green figs, too, he remembered were on the old fig-tree trained against the warm garden wall. The horse-chestnuts showed the little green knobs which would soon enlarge and hang all prickly, like the spiked balls of a holy-water sprinkle, such as was once used in the wars. Of old the folk, having no books, watched every living thing, from the moss to the oak, from the mouse to the deer; and all that we know now of animals and plants is really founded upon their acute and patient observation. How many years it took even to find out a good salad may be seen from ancient writings, wherein half the plants about the hedges are recommended as salad herbs: dire indeed would be our consternation if we had to eat them. As the beech-nuts appear, and the horse-chestnuts enlarge, and the fig swells, the apples turn red and become visible in the leafy branches of the apple-trees. Like horses, deer are fond of apples, and in former times, when deer-stealing was possible, they were often decoyed with them.

There is no tree so much of the forest as the beech. On the verge of woods the oaks are far apart, the ashes thin; the verge is like a wilderness and scrubby, so that the forest does not seem to begin till you have penetrated some distance. Under the beeches the forest begins at once. They stand at the edge of the slope, huge round boles rising from the mossy ground, wide fans of branches—a shadow under them, a greeny darkness beyond. There is depth there—depth to be explored, depth to hide in. If there is a path, it is arched over like a tunnel with boughs; you know not whither it goes. The fawns are sweetest in the sunlight, moving down from

IN THE BEECH WOODS.

the shadow; the doe best partly in shadow, — his horns up, his neck high, his dark eye partly in sun, when the branch of a tree casts its interlaced work, fine as Algerian silver-work, upon the back; the buck best when he stands among the fern, alert, yet not quite alarmed,—for he knows the length of his leap, — his horns up, his neck high, his dark eye bent on you, and every sinew strung to spring away. One spot of sunlight, bright and white, falls through the branches upon his neck, a fatal place, or near it: a guide, that bright white spot, to the deadly bullet, as in old days to the

cross-bow bolt. It was needful even then to be careful of the aim, for the herd, as Shakspeare tells us, at once recognized the sound of a cross-bow: the jar of the string, tight-strained to the notch by the goat's-foot lever, the slight whiz of the missile, were enough to startle them and to cause the rest to swerve and pass out of range. Yet the cross-bow was quiet indeed compared with the gun which took its place. The cross-bow was the beginning of shooting proper, as we now understand it; that is, of taking an aim by the bringing of one point into a line with another. With the long-bow aim indeed was taken, but quite differently, for if the arrow were kept waiting with the string drawn, the eye and the hand would not go true together. The quicker the arrow left the bow the moment that it was full-drawn, the better the result. On the other hand, the arblast was in no haste, but was adjusted deliberately—so deliberately that it gave rise to a proverb, “A fool's bolt is soon shot.” This could not apply to the long-bow, with which the arrow was discharged swiftly, while an arblast was slowly brought to the level like a rifle. As it was hard to draw again, that added strength to the saying; but it arose from the deliberation with which a good cross-bowman aimed. To the long-bow the cross-bow was the express rifle. The express delivers its bullet accurately point-blank—the bullet flies straight to its mark up to a certain distance. So the cross-bow bolt flew point-blank, and thus its application to hunting when the deer were really killed for their venison. The hunter stole through the fern, or crept about the thickets,—thickets and fern exactly like those here to-day,—or waited Indian-like in ambush behind an oak as the herd fed that way, and, choosing the finest buck, aimed his bolt so as either to slay at once or to break the fore-leg. Like the hare, if the fore-leg is injured, deer cannot progress; if only the hind-quarter is hit, there is no telling how far they may go. Therefore the cross-bow, as enabling the hunter to choose the exact spot where his bolt should strike, became the weapon of the chase, and by its very perfection began the extermination of the deer. Instead of the hounds and the noisy hunt, any man who could use the cross-bow could kill a buck. The long-bow, of all weapons, requires the most practice, and practice begun in early youth. Some of the extraordinary feats attributed to the outlaws in the woods and to the archers of the ancient English army are quite possible, but must have necessitated the constant use of a bow from childhood, so that it became second nature. But almost any man who has strength to set a cross-bow, with moderate practice, and any idea at all of shooting, could become a fairly good shot with it. From

the cross-bow to a gun was a comparatively easy step, and it was the knowledge of the power of the one that led to the quick introduction of the other. For gunpowder was hardly discovered before hand-guns were thought of, and no discovery ever spread so swiftly. Then the arquebuse swept away the old English chase.

These deer exist by permission. They are protected with jealous care; or rather they have been protected so long that by custom they have grown semi-consecrated, and it is rare for any one to think of touching them. The fawns wander, and a man, if he choose, might often knock one over with his ax as he comes home from his work. The deer browse up to the very skirts of the farm-house below, sometimes even enter the rick-yard, and once now and then, if a gate be left open, walk in and eat the pease in the garden. The bucks are still a little wilder, a little more nervous for their liberty, but there is no difficulty in stalking them to within forty or fifty yards. They have either lost their original delicacy of scent, or else do not respond to it, as the approach of a man does not alarm them, else it would be necessary to study the wind; but you may get thus near them without any thought of the breeze—no nearer; then bounding twice or thrice, lifting himself each time as high as the fern, the buck turns half towards you to see whether his retreat should or should not be continued.

The fawns have come out from the beeches, because there is more grass on the slope and in the hollow, where trees are few. Under the trees in the forest proper there is little food for them. Deer, indeed, seem fonder of half-open places than of the wood itself. Thickets, with fern at the foot and spaces of sward between, are their favorite haunts. Heavily timbered land and impenetrable underwood are not so much resorted to. The deer here like to get away from the retreats which shelter them, to wander in the half-open grounds on that part of the park free to them, or if possible, if they see a chance, out into the fields. Once now and then a buck escapes, and is found eight or ten miles away. If the pale were removed how quickly the deer would leave the close forest which in imagination is so associated with them! It is not their ideal. They would rather wander over the hills and along the river valleys. The forest is, indeed, and always would be their cover, and its shadows their defense; but for enjoyment they would of choice seek the sweet herbage, which does not flourish where the roots of trees and underwood absorb all the richness of the soil. The farther the trees are apart the better the forest pleases them. Those

AMONG THE OAKS.

great instinctive migrations of wild animals which take place annually in America are not possible in England. The deer here cannot escape—solitary individuals getting free of course, now and then; they cannot move in a body, and it is not easy to know whether any such desire remains among them. So far as I am aware, there is no mention of such migrations in the most ancient times; but the omission proves nothing, for before the Normans, before the game laws and parks together came into existence, no one who could write thought enough of the deer to notice their motions. The monks were engaged in chronicling the inroads of the pagans, or writing chronologies of the Roman Empire. On analogical grounds it would seem quite possible that in their original state the English deer did move from part to part of the country with the seasons. Almost all the birds, the only

really free things in this country now, move, even those that do not quit the island; and why not the deer in the old time when all the woods were open to them? England is not a large country, but there are considerable differences in the climate and the time at which vegetation appears, quite sufficient of themselves to induce animals to move from place to place. We have no narrowing buffalo zone to lament, for our buffalo zone disappeared long ago. These parks and woods are islets of the olden time, dotted here and there in the midst of the most modern agricultural scenery. These deer and their ancestors have been confined within the pale for hundreds of years, and though in a sense free, they are in no sense wild. But the old power remains still. See the buck as he starts away, and jumps at every leap as high as the fern. He would give the hounds a long chase yet.

The fern is fully four feet tall, hiding a boy entirely and only showing a man's head. The deer do not go through it unless startled: they prefer to follow a track already made, one of their own trails. It is their natural cover, and when the buckhounds meet near London the buck often takes refuge in one or other of the fern-grown commons of which there are many on the southern side. But fern is inimical to grass, and, while it gives them cover, occupies the place of much more pleasant herbage. As their range is limited, though they have here a forest of some extent as well as the park to roam over, they cannot always obtain enough in winter. In frost, when the grass will not grow, or when snow is on the ground, that which they can find is supplemented with hay. They are, in fact, foddered exactly the same as cattle. In some of the smaller parks they are driven into inclosures and fed altogether. This is not the case here. Perhaps it was through the foggers, as the laborers are called who fodder cattle and carry out the hay in the morning and evening, that deer poachers of old discovered that they could approach the deer by carrying a bundle of sweet-smelling hay, which overcame the scent of the body and baffled the buck's keen nostrils till the thief was within shot. The foggers, being about so very early in the morning,—they are out at the dawn,—have found out a good many game secrets in their time. If the deer were outside the forest at any hour it was sure to be when the dew was on the grass, and thus they noticed that with the hay truss on their heads they could walk up quite close occasionally. Foggers know all the game on the places where they work: there is not a hare or a rabbit, a pheasant or a partridge, whose ways are not plain to them. There are no stories now of stags a century old (three would go back to Queen Elizabeth); they have gone, like other traditions of the forest, before steam and breech-loader. Deer lore is all but extinct, the terms of venery known but to a few; few, indeed, could correctly name the parts of a buck if one were sent them. The deer are a picture only—a picture that lives and moves and is beautiful to look at, but must not be rudely handled. Still, they linger while the marten has disappeared, the pole-cat is practically gone, and the badger becoming rare. It is curious that the badger has lived on through suzerainty for three centuries. Nearly three centuries ago a chronicler observed that the badger would have been rooted out before his time had it not been for the parks. There was no great store of badgers then: there is no great store now. Sketches remain in old country-houses of the chase of the marten: you see the hounds all yelping round the foot of a tree, the marten up in it,

and in the middle of the hounds the huntsman in topboots and breeches. You can but smile at it. To Americans it must forcibly recall the treeing of a coon. The deer need keep no watch, there are no wolves to pull them down; and it is quite probable that the absence of any danger of that kind is the reason of their tameness even more than the fact that they are not chased by man. Nothing comes creeping stealthily through the fern, or hunts them through the night. They can slumber in peace. There is no larger beast of prey than a stoat, or a stray cat. But they retain their dislike of dogs, a dislike shared by cattle, as if they too dimly remembered a time when they had been hunted. The list of animals still living within the pale and still wild is short indeed. Besides the deer, which are not wild, there are hares, rabbits, squirrels, two kinds of rat,—the land and the water rat,—stoat, weasel, mole, and mouse. There are more varieties of mouse than of any other animal: these, the weakest of all, have escaped best, though exposed to so many enemies. A few foxes, and still fewer badgers, complete the list, for there are no other animals here. Modern times are fatal to all creatures of prey, whether furred or feathered; and so even the owls are less numerous, both in actual numbers and in variety of species, than they were even fifty years ago.

But the forest is not vacant. It is indeed full of happy life. Every hollow tree—and there are many hollow trees where none are felled—has its nest of starlings, or titmice, or woodpeckers. Woodpeckers are numerous, and amusing to watch. Wood-pigeons and turtle-doves abound, the former in hundreds nesting here. Rooks, of course, and jackdaws,—daws love hollow trees,—jays, and some magpies. The magpie is one of the birds which have partly disappeared from the fields of England. There are broad lands where not one is to be seen. Once looking from the road at two in a field, a gentleman who was riding by stopped his horse and asked, quite interested, "Are those magpies?" I replied that they were. "I have not seen any since I was a boy till now," he said. Magpies are still plentiful in some places, as in old parks in Somersetshire, but they have greatly diminished in the majority of instances. There are some here, and many jays. These are handsome birds, and with the green woodpeckers give color to the trees. Night-jars or fern-owls fly round the outskirts and through the open glades in the summer twilight. These are some of the forest birds. The rest visit the forest or live in it, but are equally common to hedgerow and copse. Woodpeckers, jays, magpies, owls, night-jars, are all distinctly forest and park birds, and are continually with

A FOGGER.

the deer. The lesser birds are the happier that there are fewer hawks and crows. The deer are not torn with the cruel tooth of hound or wolf, nor does the sharp arrow sting them. It is a little piece of olden England without its terror and bloodshed.

The fawns fed away down the slope and presently into one of the broad green open paths

or drives, where the underwood on each side is lined with bramble and with trailing white rose, which loves to cling to bushes scarcely higher than itself. Their runners stretch out at the edges of the drive, so that from the underwood the mound of green falls aslant to the sward. This gradual descent from the trees and ash to the bushes of hawthorn, from the haw-

thorn to the bramble, thence to the rose and the grass, gives to the vista of the broad path a soft, graceful aspect.

After the fawns had disappeared, the squire went on and entered under the beeches from

He crossed several paths leading in various directions, but went on, gradually descending till the gable end of a farm-house became visible through the foliage. The old red tiles were but a few yards distant from the boughs

BADGER AND SQUIRREL.

which they had emerged. He had not gone far before he struck and followed a path which wound between the beech trunks and was entirely arched over by their branches. Squirrels raced away at the sound of his footsteps, darting over the ground and up the stems of the trees in an instant. A slight rustling now and then showed that a rabbit had been startled. Pheasants ran too, but noiselessly, and pigeons rose from the boughs above. The wood-pigeons rose indeed, but they were not much frightened and quickly settled again. So little shot at, they felt safe, and only moved from habit.

of the last beech, and there was nothing between the house and the forest but a shallow trench almost filled with dead brown leaves and edged with fern. Out from that trench, sometimes stealthily slipping between the flattened fern-stalks, came a weasel, and, running through the plantains and fringe-like may-weed or stray pimpernel which covered the neglected ground, made for the straw-rick. Searching about for mice, he was certain to come across a hen's egg in some corner, perhaps in a hay-crib, which the cattle, now being in the meadow, did not use. Or a stronger stoat crept out and attacked anything that he

fancied. Very often there was a rabbit sitting in the long grass which grows round under an old hay-rick. He would sit still and let any one pass who did not know of his presence, but those who were aware used to give the grass a kick if they went that way, when he would carry his white tail swiftly round the corner of the rick. In winter hares came nibbling at everything in the garden, and occasionally in summer, if they fancied an herb: they would have spoiled it altogether if free to stay there without fear of some one suddenly appearing.

Dogs there were in plenty, but all chained, except a few mere puppies which practically lived indoors. It was not safe to have them loose so near the wood, the temptation to wander being so very strong. So that, though there was a continual barking and long, mournful whines for liberty, the wild creatures came in time to understand that there was little danger, and the rabbit actually sat under the hay-rick.

Pheasants mingled with the fowls and, like the fowls, only ran aside out of the way of people. In early summer there were tiny partridge chicks about, which rushed under the coop. The pheasants sometimes came down to the kitchen door, so greedy were they. With the dogs and ponies, the pheasants and rabbits, the weasels and the stoats, and the ferrets in their hutches, the place seemed really to belong more to the animals than to the tenant.

The forest strayed indoors. Bucks' horns, feathers picked up, strange birds shot and stuffed, fossils from the sand-pits, coins and pottery from the line of the ancient Roman road, all the odds and ends of the forest, were scattered about within. To the yard came the cows, which, with bells about their necks, wandered into the fern, and the swine, which searched and rooted about for acorns and beech-mast in autumn. The men who dug in the sand-pits or for gravel came this way in and out to their labor, and so did those who split up the fallen trunks into logs. Now and then a woodpecker came with a rush up from the meadows, where he had been visiting the hedgerows, and went into the forest with a yell as he entered the trees. The deer fed up to the precincts, and at intervals a buck at the dawn got into the garden. But the flies from the forest teased and terrified the horses, which would have run away with the heavily loaded wagon behind them if not protected with fine netting as if in armor. They did run away sometimes at harrow, tearing across the field like mad things. You could not keep the birds out of the garden, try how you would. They had most of the sowings up. The blackbirds pecked every apple in the orchard. How the dead leaves in

autumn came whirling in thousands through rick-yard and court in showers upon the tiles! Nor was it of much avail to sweep them away; they were there again to-morrow, and until the wind changed. The swallows were now very busy building; there were not many houses for them, and therefore they flocked here. Up from over the meadows came the breeze, drawing into the hollow recesses of the forest behind. It came over the grass and farther away over corn just yellowing, the shadows of the clouds racing with it and instantly lost in the trees. It drew through the pillars of the forest, and away to the hills beyond.

The squire's ale was duly put for him, the particular gossip he liked was ready for him; and having taken both, he looked at his old watch and went on. His path now led for a while just inside the pale, which here divided the forest from the meadows. In the olden time it would have been made of oak, for they built all things then with an eye to endurance; but it was now of fir, pitched, sawn from firs thrown in the copses. For the purpose of keeping the deer in, it was as useful as the pale of oak. Oak is not so plentiful nowadays. The high spars were the especial vaunting-places of the little brown wrens which perched there and sang, in defiance of all that the forest might hold. Rabbits crept under, but the hares waited till evening and went round by the gates. Presently the path turned and the squire passed a pond partly dried up, from the margin of which several pigeons rose up, clattering their wings. They are fond of the neighborhood of water, and are sure to be there sometime during the day. The path went upwards, but the ascent was scarcely perceptible through hazel bushes, which became farther apart and thinner as the elevation increased, and the soil was less rich. Some hawthorn bushes succeeded, and from among these he stepped out into the open park. Nothing could be seen of the manor-house here. It was hidden by the roll of the ground and the groups of trees. The close sward was already a little brown — the trampling of hoofs as well as the heat causes the brownish hue of fed sward, as if it were bruised. He went out into the park, bearing somewhat to the right and passing many hawthorns, round the trunks of which the grass was cut away in a ring by the hoofs of animals seeking shadow. Far away on a rising knoll a herd of deer were lying under some elms. In front were the downs, a mile or so distant; to the right, meadows and cornfields, towards which he went. There was no house nor any habitation in view; in the early part of the year, the lambing-time, there was a shepherd's hut on

wheels in the fields, but it had been drawn away.

According to tradition, there is no forest in England in which a king has not hunted. A king, they say, hunted here in the old days of the cross-bow; but happily the place escaped notice in that artificial era when half the parks and woods were spoiled to make the engraver's ideal landscape of straight vistas, broad in the foreground and narrowing up to nothing. Wide, straight roads — you can call them nothing else — were cut through the finest woods, so that upon looking from a certain window, or standing at a certain spot in the grounds, you might see a church tower at the end of the cutting. In some parks there are half a dozen such honors shown to you as a great curiosity; some have a monument or pillar at the end. These hideous disfigurements of beautiful scenery should surely be wiped out in our day. The stiff, straight cutting could soon be filled up by planting, and after a time the woods would resume their natural condition. Many common highway roads are really delightful, winding through trees and hedge-rows, with glimpses of hills and distant villages. But these planned, straight vistas, radiating from a central spot as if done with ruler and pen, at once destroy the pleasant illusion of primeval forest. You may be dreaming under the oaks of the chase or of *Rosalind*: the moment you enter such a vista all becomes commonplace. Happily this park escaped, and it is beautiful. Our English landscape wants no gardening: it *cannot* be gardened. The least interference kills it. The beauty of English woodland and country is in its detail. There is nothing empty and unclothed. If the clods are left a little while undisturbed in the fields, weeds spring up and wild-flowers bloom upon them. Is the hedge cut and trimmed, lo! the blue-bells flower the more and a yet fresher green buds forth upon the twigs. Never was there a garden like the meadow: there is not an inch

of the meadow in early summer without a flower. Old walls, as we saw just now, are not left without a fringe; on the top of the hardest brick wall, on the sapless tiles, on slates, stonecrop takes hold and becomes a cushion of yellow bloom. Nature is a miniature painter and handles a delicate brush, the tip of which touches the tiniest spot and leaves something living. The park has indeed its larger lines, its broad open sweep, and gradual slope, to which the eye accustomed to small inclosures requires time to adjust itself. These left to themselves are beautiful; they are the surface of the earth, which is always true to itself and needs no banks nor artificial hollows. The earth is right and the tree is right: trim either and all is wrong. The deer will not fit to them then.

The squire came near enough to the cornfield to see that the wheat-ears were beginning to turn yellow and that the barley had the silky appearance caused by the beard, the delicate lines of which divide the light and reflect it like gossamer. At some distance a man was approaching; he saw him, and sat down on the grass under an oak to await the coming of *Ettles* the keeper. *Ettles* had been his rounds and had visited the outlying copses, which are the especial haunts of pheasants. Like the deer, pheasants, if they can, will get away from the main wood. He was now returning, and the squire, well knowing that he would pass this way, had purposely crossed his path to meet him. The dogs ran to the squire and at once made friends with him. *Ettles*, whose cheek was the color of the oak apples in spring, was more respectful: he stood till the squire motioned him to sit down. The dogs rolled on the sward, but, though in the shadow, they could not extend themselves sufficiently nor pant fast enough. Yonder the breeze that came up over the forest on its way to the downs drew through the group of trees on the knoll, cooling the deer as it passed.

Richard Jefferies.

A MEXICAN CAMPAIGN.

BY THOMAS A. JANVIER, AUTHOR OF THE "IVORY BLACK" STORIES.

IN THREE PARTS. PART III.

THE STORMING OF CHAPULTEPEC.

WHEN Pem, a few days later, had recovered his composure sufficiently to give Rose a circumstantial account of the Churubusco battle, that very hopeful young person took her usual cheerful view of what some people might have considered a desperate situation.

"It could n't have been better if we'd planned it all in advance," she said. "Even Van's interruption was just what was wanted, and I shall tell the poor boy that I am sorry I scolded him so for it; I will, indeed."

"Don't you see," she went on, for Smith certainly did not look much like a person who saw anything of an encouraging nature anywhere—"don't you see what a fix she's got herself into by saying a great deal more than she meant to? It's all as plain as possible. She made up her mind some time ago, just as I told you, that she would fight you off, because she was afraid she would fall in love with you; which meant that she really had begun to fall in love with you and did n't know it—or that she knew it and would n't tell herself about it. You can't understand that, I suppose; but any woman can. And then you succeeded in getting her off that way, and began to say things to her; and she got worried, and scared, and lost her wits a little, and hit ever so much harder than she really meant to. She never would have brought up the war again, I'm sure, if she had n't felt herself to be in a corner and quite desperate. When you suddenly twisted things round on her that way, her first thought, of course, was to tell you that she did n't hate you at all. And then she saw that that would n't do, for it would give you a chance to go right ahead and ask her if she loved you. And then she thought things over and came to the conclusion,—you must always remember what a horrid time she had with that dreadful old husband, and how firmly she has made up her mind never to marry again,—and then, I say, she came to the conclusion that the only thing to do was to break things off short, and have done with it. So she said that she hated you."

"Well, that is only another way of telling all that I have told you, Mrs. Brown."

"It is not what you told at all; for you told it as though you thought that she meant it, and I know that she did n't. She only meant to mean it, that's all."

"Are n't we dropping into metaphysics a little?" Pem asked, drearily. "I don't see that much comfort is to be had from such a finely drawn distinction as that is. Meaning a thing, and meaning to mean a thing, strike me as convertible terms. Don't they you?"

"If a man used them, I suppose they would not have much difference; but when a woman uses them, they have all the difference in the world. When a woman really means a thing, she means it—that is, of course, for the time being. Naturally, things happen sometimes to make her change her mind. But when she only means to mean a thing, she does not really, in the depths of her heart, mean it at all. She only thinks that she ought to, you know. And in the case of Carmen," Rose went on, becoming practical, much to Pem's relief,—for his masculine mind very imperfectly grasped this line of highly abstract feminine reasoning,—“it is perfectly clear that she only said she hated you because she has this foolish notion in her head about not getting married, and was ready to say anything at the moment that would stop you from finding out that she really loves you. For she does love you now, Mr. Smith; and, what is more, she knows it herself."

"But if she won't admit that she loves me, and if she continues to hold me off in this way, I don't see that any good can come of it. It has been very kind of you, Mrs. Brown, to help me as you have done, and to be so sympathetic and good to me, and I am as grateful to you as I can be. But I think that I'll give up now. It is n't fair, you know, to trouble her any more when it is so clear that she wants me to keep away from her. So I think that to-morrow I'll go up to Guanajuato,—it was there that I first saw her, you know,—and I—I should like to go once more to the Presa, where we had our first walk together. And then I'll go on north. I'd be rather poor company, so I don't mind leaving the party. And I think that I will take a long journey somewhere. I've been wanting for some time to go into central Africa: it must be a very interesting country, from what I've read about it. And if I should happen to die of the coast-fever, or get bowled over in a fight, or something of

that sort, you know, it might be just as well. And some time or other you will see her again, very likely; and then you'll tell her that I really did think a good deal of her, won't you? And if she —"

"Mr. Smith," said Rose with severity, "you will please stop right there. What you are to do to-morrow is not to go to Guanajuato, and from there to a grave in central Africa. You are going with the rest of us to Chapultepec — and you are going to try again!"

"But what chance will I have to try again? You don't suppose for a moment, do you, that Carmen will be of the party? She will know that I will be with the rest of you, or, at least, she will expect me to be, and of course she will stay at home."

"No," said Rose, decidedly; "she will not stay at home. During the past few days she has been thinking things over and has been very miserable. Violet saw her yesterday, and said that she looked wretchedly. And she said that Carmen talked to her for nearly two hours about the way we live at home and about Violet's own life, and said things about the impossibility of Mexicans and Americans marrying, seemingly to give Violet a chance to say how happy her marriage with Mr. Mauve had been. And she asked if it was n't true that all the Americans wanted to make war again on Mexico, and if they were not talking about it all the time and getting ready for it, and seemed very much astonished when Violet told her that the majority of Americans knew very little more about Mexico than that there was such a country in existence, and that they had no more notion of making war against it than of making war against the moon. And what she knows now about the happy life that Violet has led after being married to an American, together with what she herself had been thinking about the probability that her own dismal marriage was n't a fair sample of married life at all, I'm sure has put her mind into a very unsettled state all around. What you must do now is to finish unsettling it, and then settle it for her once and for all. She certainly will give you the chance. I think that I have not told you yet that she told Violet that she was going to Chapultepec?"

"O Mrs. Brown! How could you keep that back until the very last?"

"So will you go to Chapultepec too, Mr. Smith; or do you still insist upon central Africa and a lonely grave?"

THE expedition to Chapultepec was in the nature of a farewell, for on the ensuing day the Americans were to leave the City of Mexico for their visit to the Carmine hacienda on Lake Cuitzeo. If they returned to the capital

it would be only for a night on their way northward; and there was a possibility that they might take the train for the north at Celaya, and so not return to the capital at all. They were pretty dismal over the prospect of home-going, for a very warm love of Mexico had taken possession of all their hearts. Even Mrs. Gamboge, while firmly of the opinion that there was something radically wrong in a country that countenanced hard pillows and employed men as chambermaids, admitted that this journey into Mexico was the pleasantest journey that she had ever made.

And they all were very grateful to the Mexican friends who had done so much to make their stay in the capital delightful. The several interpreters of the party were kept busy that afternoon, as they walked in the beautiful park of Chapultepec, in rendering into Spanish hearty words of thanks, and into English courteous disclaimers of obligation conferred. The pleasure had been all on their side, said their Mexican friends. Nor was this interchange of international amenities ended when they passed out from beneath the long, slanting shadows of the great *ahuehuetes* — the moss-draped trees which were old four centuries ago, before ever the Spaniards came into the land — and slowly walked up the winding way to the height on which the castle stands.

Pem had been shocked when he first saw Carmen's face that afternoon. The lines were drawn as though with illness, and she seemed older by a full year than when he last had seen her. He saw, too, that the spring had gone out of her step, and an air of languor hung over her that she made no effort to throw off. She did not seek to evade him, but as they walked together she managed always to keep near her aunt; and her talk, conforming to her actions, was languid and dull. The only sign of good hope that he could perceive was that gradually a little color came into her face and a little brightness into her eyes.

As they went up the terraced road to the castle, catching lovely glimpses of the valley out between the trees, Pem walked slowly, that they might drop behind the rest and be alone. Once or twice he stopped, calling her attention to the view. His tactics were not successful; for as soon as the space between themselves and the others became appreciable she hastened her steps, and the chance that he thought he had secured was lost. Yet he marked a little hesitancy in her manner each time this maneuver was executed that seemed to imply a disposition on her part, possibly all the stronger because it was thus checked, to grant him the opportunity to speak that he

desired. Once, or twice even, she herself lingered in the way and seemed about to speak; and then moved quickly forward, holding her peace.

Pem would have been glad of the chance to take counsel of Rose at this juncture, for he was at a loss to determine whether these curious signs promised good or boded ill. This young gentleman from Philadelphia was not very wise in the ways of women; but even had he been far wiser than he was, *Cármen's* curious conduct very well might have puzzled him.

As they came out upon the eastern terrace the glorious sunset view, a reflected splendor in the east, burst upon them — one of the great sunset views of the world.

Below them, at the foot of the sharp, craggy descent, and surrounded by the trees of the eastern park, lay the tiny lake that *Carlotta* caused to be made while she played for a little space her part of empress here in the castle. To the right lay *Tacubaya*, a cluster of low, square houses embowered in trees, on a long, sloping hill-side; and beyond *Tacubaya* rose the blue encircling wall of mountains, culminating in the great solemn mass of *Ajusco*, that shuts in the valley on the south. To the left lay the city, with its tall church towers rising high above the houses, and its many domes, covered with glazed tiles, flashing in the last rays of the sun; and, farther on, the church of *Guadalupe* stood out against the hazy lines of the mountains of *Teypeyac*, and on *Lake Tezcuco* shimmered a soft light. Right in front, the trees of the park merged into other trees beyond its limits; and the great valley, dotted with gray houses, and gray church towers, and green remnants of ancient forests, and broad, green meadows, stretched away for miles and miles eastward; and in the midst of it the waters of *Lake Chalco* shone as though on fire. And beyond all, against the limit of the eastern sky, towered the two great volcanoes — masses of gold and crimson clouds above them, and a rich rosy light resting upon their crest-coverings of eternal snow.

Cármen and Pem had stopped a little behind the others; and when *Don Antonio* suggested a slight change of position, she took a step or two and then stood still. The others moved a little to the left. Pem moved a little to the right; and *Cármen*, following him, seated herself upon a low wall. The little color that had come into her cheeks in the park had left them now; but her eyes had brightened curiously. Presently they heard *Don Antonio* advise a move to the roof of the castle: this hospitable Mexican seemed to regard the sunset as an entertainment that he himself had

provided for the pleasure of his American friends, and wished to make sure that they got the full benefit of it. Pem looked inquiringly at *Cármen*; but her gaze was fixed upon the distant mountains, and she made no sign of moving. Then the sound of footsteps and voices died away; and so, at last, they were alone.

Cármen had leaned her head back against the stone wall — just as she had sat that day at *Churubusco* — and was looking out dreamily across the valley. For the time being she appeared to be quite unconscious of the fact of Mr. Pemberton Logan Smith's existence. Although the situation was precisely that which for two hours past he had been seeking to accomplish, Pem found it, now that it was secured, a trifle embarrassing. *Cármen's* manner did not at all invite the utterance of the words which he so earnestly desired to speak; but the longer that the silence continued the more he found his nerves going wrong. It was rather at random that he spoke at last.

"The great mountain to the left is called the White Woman, I am told, *Señorita*. It is a dismal fancy, this of a dead woman lying enshrouded in the snow."

Cármen gave a little sigh as she roused herself. "The *Señor* does not know the story," she answered absently. "The White Woman is not dead. Far down beneath the snow-covering the fires of her life burn hotly. She sleeps, and the great mountain beside her is her lover, who wakens her with his kiss. This is the foolish story that the common people tell. The Mexicans are very silly, very superstitious, very stupid — as the *Señor* knows."

Cármen uttered her comments upon the legend and upon her fellow-countrymen hastily and nervously, as though seeking to divert attention from the folk-story itself — a story that she had known, of course, all her life, and that she had told in sheer absence of mind.

"Is it not possible, *Señorita*," Pem replied, ignoring that portion of her speech that she had added precisely for the purpose of diverting him from what she perceived to be a dangerous line of investigation, "that this is not a foolish story, but a wise allegory? May it not sometimes happen that real women seek to hide with snow the warm love that is in their hearts? I am not speaking lightly, *Señorita*. I should be very glad to believe that this story has a deep meaning within it; that it is not a mere foolish fancy, but a beautiful and eternal truth." And then he added, speaking very gently, "Will not the *Señorita* tell me that this may be true?"

Cármen was silent for a moment, and when she spoke there was a grave, solemn tone in her voice that struck a chill into Pem's heart.

"Yes, Señor," she said; "it *is* true. It is true now, and it has been true always. Since the world began there must always have been some women whose fate it was that their love thus should be chilled upon its surface and so hidden; and believe me, Señor,"—and a certain wistfulness of expression came into Carmen's face as she spoke,—"such hidden love as this perhaps may be stronger than the love that is felt and known."

Carmen was silent for a moment, but there was something in her manner that made Pem refrain from speech. Then, still speaking in the same chill, solemn tone, and very slowly, she went on:

"I know what you mean, Señor. I am not a young girl; I have been in the world, and I understand. You do me the honor to love me, and to want my love in return. But this may not be—not, that is, in the way that you desire. I cannot tell you the story of my life. There are some things in it that I have not told even to the good father to whom I confess. Perhaps this has been a sin; but sometimes I think that this rule of our Church which commands us to lay bare our hearts to men, though the men are God's ministers, is not a good rule. It is a great presumption for me to cherish such a thought, but I cannot help it. I have told my sorrows to the God who made me, and who in his wisdom has made my life sad; not to his mother, nor to his saints, you understand, but to him.

"And what I have told only to God I cannot tell even to you. But you may know at least that my life has been very, very bitter since the time that—that I was sold. I really was sold, Señor; and I had not even the poor consolation which is given to some unhappy, lost women,—but less unhappy and less hopelessly lost than I am,—of selling myself. It was as though I had been put in a marketplace like a horse or a cow, and for my poor beauty's sake I was bought! Of the time that came afterward I cannot speak, I cannot bear even to think,"—Carmen shuddered as she spoke, and her face flushed with shame and anger,—"but yet I cannot drive the horror of it from my thoughts. And then, at last,—to others it seemed very soon, but not to me,—the God who had brought this bitter sorrow upon me gave me a little help, for my owner died. It had been better far that I had died then too, for I was dead to peace, to hope; my life was ended at a time when for most women life has just begun."

Again Carmen was silent for a little space, and then she said: "Now you will understand, Señor, why it is that I tell you that the story of the White Woman yonder is true; for I myself, a living woman, know that whatever

there may be of warm love in my heart forever must remain buried deep beneath the snow."

Pem's eyes had tears in them as Carmen ceased to speak. Once or twice he had put out his hand to her, but she had motioned it away. When she had made an end he spoke eagerly; and while his voice was husky and uncertain, its tone was firm.

"Carmen, Carmencita," he said, "your sorrows have been very heavy and hard to bear, but may not the time have come, at last, when in place of sorrow you shall have happiness? Is it too much for me to offer you this hope? But in my love—my love is very strong, Carmencita; far stronger now that I know how grievous your life has been—I do not dare too greatly when I promise you shelter and great tenderness; and so may come to you peace and rest. And remember," he went on quickly, checking her rising speech, "that my happiness for all my life rests now upon your answer. Love is a very selfish passion, otherwise I would not think, after what you have told me, of my own happiness at all. But I do think of it, though less than of yours. I know that without you my life will be hopeless and worthless. I believe that with me, away from all those things which will not permit you to forget,—in a new life that will make forgetfulness easy, and that will give you the breadth and freedom that I know you need and wish,—happiness is in store for you. Think, think of all this before you tell me that you will live on despairingly, and that into my life also you will bring despair."

Carmen sat motionless. Through her half-closed eyes she looked out upon the fading sunset. The golden gleams no longer were in the sky now, and the crimson had faded into a soft rose-color. On the snow-peaks rested a deep violet tint, and the White Woman shone ghost-like through a purple haze.

"Señor," she said at last, "it may not be. What you have told me of the life that I could live with you I know in my heart is truth. I know that among your people I should find what I long for, and what I cannot find among my own. I have longed with all my heart's strength for the life that you offer me; and I have longed for it far more since I have known you. And I do love you—" Pem started forward, but Carmen restrained him by a motion of her hand. "I love you so well that I cannot consent to accept my happiness at such a cost to you. After the shame that has been put upon me I feel that I am not fit to be your—your wife; I am not fit to be the wife of any honest man. Could you but know!"

Carmen shuddered again, and her voice

dropped low. Then, in a moment, she went on: "This is an old, old world, Señor, and it seems to me that some day it must of itself fall to pieces, so heavy is the load of sorrow and suffering and shame that it carries. But we who are of it must bear with it, and must bear our own part in it, stayed by such hope of another and a better world as God in his goodness may put into our hearts. Sometimes I think that the talk about God's goodness is only a fond delusion, invented by men to save themselves wholly from despair. But I fight against this thought, for if it once fairly possessed my soul I know that I should go mad. And what matters, when all is sorrow, one sorrow more or less? I have borne much, and of my suffering no good has come. What I bear now in refusing the life that you offer me I can bear gladly, for I know that I am bringing good to you. So this is the end.

"See, the dark shadows are falling upon the White Woman. The fire is there, but it is, it must be, covered with eternal snow. Hark! Don Antonio is calling us. We must go to him."

"Cármen," said Pem, speaking resolutely and quickly, "I will not take this answer. I command you not to wreck both of our lives when for both of us happiness is within easy reach. I love you, and so I am your servant; but you own your love for me, and so I am your master. By the right that this love gives me I lay on you my command—accept my love, and with it the life that I offer you!"

"Señor—I—I—how can I answer? At least—let me think. Give me a little time."

Voices and footsteps were near at hand. Pem had only a moment left. "You shall have time to think. To-morrow we go to the hacienda. We shall be there a week; longer, perhaps. Very well, I give you till my return to think. But remember, my order has been given, and it must be obeyed!"

"It was much finer, the view from the tower of the castle, Señor; why did you linger here?" Don Antonio asked politely, but in the slightly injured tone of one who, having provided a feast, feels that a guest is not doing justice to it.

"You must forgive me, Don Antonio, but the Señorita, your niece, as we turned to follow you, had a narrow escape from a fall here at this broken space in the parapet. It was a great danger, and the shock unnerved her. See, she still is pale. But she is recovering now, and we were about to go in search of you when we heard you call."

Cármen, no doubt, was grateful to Pem for this somewhat stirring flight of fancy; but it involved them both subsequently in a rather trying exercise of their respective imagina-

tions, for the entire party insisted upon hearing the minutest details of the adventure told. Only Rose refrained from questioning. She had not much faith in the parapet story, but she did have her own ideas, and reserved her questions accordingly. But what really had happened, beyond the bare fact that that afternoon on the heights of Chapultepec had marked a turning-point in the campaign, Rose never knew.

THE CONQUEST OF MEXICO.

SEÑOR CARMINE'S hospitality, being put to a practical test by the arrival at his hacienda of the entire American party, proved to be as boundless in fact as it had been boundless in promise. His only regret was that the party had not been organized on a larger scale. Jaune and Van, indeed, found his pressing questions as to why the surviving parents of their respective wives had not come with them a trifle embarrassing.

The Señora Carmine—or Mrs. Carmine, as, with lingering memories of her early life at Fort Leavenworth, she preferred to be styled—was equally instant, and far more voluble, in her expressions of welcome and general good-will. She was a stout, jolly woman of eight-and-forty, or thereabouts, with just a suggestion of brogue in her English and Spanish, and with a heart that seemed to be as big as she herself was broad. Rowney Mauve found her at once shocking and delightful, and had the wisdom to congratulate himself upon the fact that his feelings towards his mother-in-law could be of this mixed sort. From Violet's report of her he had expected that things would be a good deal worse.

In point of fact, all of the Americans had dreaded this visit a little. It is one thing to associate somewhat formally with foreigners in a city, and it is quite another thing to be projected into close and intimate association with a foreign family in its own home. Mrs. Gamboge, in whose character adaptability was not an especially prominent trait, frankly admitted that she wished that the visit were well over; and in this wish Mr. Gamboge, who took a warm interest in his own personal comfort and was impressed by a prophetic conviction that this was one of the occasions when his personal comfort would have to be sacrificed, heartily sympathized. Mr. Mangan Brown had his own private doubts as to how things would work out; but he went at the matter cheerfully, and comforted himself with the conviction that, after all, a fortnight is not a very important part of a lifetime. The younger members of the party were disposed to regard the visit in the light of a

very original frolic, and to get as much fun out of it as possible.

Violet, of course, was in a condition of enthusiastic delight that she manifested in her own vigorous fashion, completely exhausting Rowney Mauve during the first two or three days by trotting him about, on foot and on horseback, to see the various places and people and things on the hacienda especially beloved by her. And when Rowney, who was a capital horseman, got the better of the bucking pony, Violet's pride in him was unbounded. This equine victory of Rowney's had the further good result of settling him firmly in the Carmine family heart.

"Ah! he can ride," said Señor Carmine, with the same complacent air that an American father would say of his daughter's husband, "He belongs to one of the best families in the State; he is a consistent church-member; and he is worth five hundred thousand dollars."

But none of the doubts which disturbed the minds of the American visitors disturbed the minds of their Mexican hosts. Self-consciousness is not a characteristic of the kindly Spanish-American race. With a frank cordiality Señor Carmine welcomed these strangers within his gates; and as he was very glad to see them his guests, he did not for a moment imagine that they could be anything else than glad too. In a general way he knew that their customs must be unlike his, and he expected some manifestations of this difference which would seem to him strange. Americans were curious creatures. Had he not married one, and did he not know? It was a cardinal belief with Señor Carmine that his wife, the Señora Brígida O'Jara de Carmine,—the descendant, as she herself had assured him, of a line of Irish kings, and the daughter of a prominent citizen of Fort Leavenworth,—was a shining example of the grace, the elegance, and the refinement of the Americans of the North. It surprised him a good deal to find how, in certain ways, the American ladies now his guests differed from this his standard of American ladyhood.

As for the Señora, this access of American society caused her to renew her youth like the eagles. It was her desire to make the house and the household, for the time being, as American as possible. She arranged her guest-chambers in the fashion, as nearly as she could remember it, of the aristocratic hotel in Kansas City that her father had taken her to for a week, five and twenty years before. She introduced substantial breakfasts at 8 o'clock, and Señor Carmine, eating for politeness's sake, nearly ruined his digestion by his enforced abandonment of his morning bread and chocolate.

On the evening that the Americans arrived, this hospitable lady announced that "it 'u'd be after makin' them feel more home-like, sure, to play some American games," and added, after a moment's reflection, "How 'u'd yees like 'Copenhagen,' now?" And in spite of Violet's protests, Mrs. Carmine organized the game instantly, and "chosed" Mr. Mangan Brown and kissed him with a hearty smack that was the very embodiment of cheery hospitality. And both Señor Carmine and Mrs. Gamboge were rather shocked, and very nervous over it, when Señor Carmine, acting under his wife's orders, in accordance with the rules of elegant society in Fort Leavenworth, "chosed" and kissed the eldest lady among his guests.

Señor Carmine felt called upon to explain through Violet that this cordial freedom was not in accordance with Mexican customs, which very emphatically was the truth. "But while our house is honored by the presence of Americans," he added, "we desire to make our ways like theirs." Even Mr. Gamboge, after this friendly speech, was not so lacking in tact as to suggest that their host be informed that "Copenhagen" was not an usual form of evening amusement in all classes of society in New York.

However, in private, Violet took upon herself the task of enlightening her mother in the premises. The Señora was a good deal cut up about it.

"To think how times has changed since I was a gurr! Violet dear! We all uv us, from the Mejor down, was great hands for kissin'-games in the old days at the Foort; an' moighty good fun 't was, too. Your mother's after feelin' that she 's an old woman, sure," ruefully said the descendant of the royal house of O'Jara. But she accepted her daughter's advice in good part, and among the various modes of entertainment which she thereafter devised for the benefit of her guests "kissin'-games" did not reappear.

To Rose the most distinctive feature of the visit was the arrangement of her bed-chamber. The Señora's memory of the hotel in Kansas City had not been very clear. In fact, it consisted principally of rocking-chairs. As it is a matter of pride with Mexican housewives to have as many chairs as possible in a room, the Señora had sent a liberal order for rocking-chairs to the City of Mexico as soon as the coming of the Americans had been arranged.

"It 's a little horrifying somehow, Van, don't you think," Rose said, "to see all those six rocking-chairs in a row that way? It 's like ghosts and skeletons, you know." Brown failed to see where the ghostliness and skele-

ton-likeness came in; but he was accustomed to having Rose discover unexpected resemblances, and took the matter easily.

"Of course the two little beds are all right," she went on, "for that's the regular Mexican custom; but I wish they had n't put them at opposite ends of the room—it's such a very big room, you see."

"Big enough for a town-hall, up in our part of the world," Van assented.

"But suppose I'm taken sick, or something frightens me in the night; what am I to do?"

"You might have your shoes handy, and shy them at me. You would n't be likely to throw straight enough to hit me; but I'd hear things banging about, and wake up in time to rescue you."

"Don't be foolish, Van; I'm really in earnest. It is dreadful to be so far away in the dark. And—why, Van, there is n't any slop-bucket, and there's only one towel. And it can't be because they're poor, or anything like that, for they're not; and the basin and the pitcher are perfectly beautiful French china, good enough for bric-à-brac. Don't you think it very strange? Oh! who's that?"

Van himself was a little startled, for a door at the end of the room opened and a nice-looking old woman placidly walked through the apartment—smiling in a friendly way at them—and passed out by one of the doors opening on the corridor, bidding them, as she departed, an affable good-night. Neither Rose nor Van was exactly in costume for receiving even transient visitors.

Brown went to close the door through which the old woman had entered. "Why, it's a chapel!" he said. "She must have been in there saying her prayers. And I don't see what we are going to do about ventilation," he continued, as he examined the doors opening on the corridor. "These things are solid wood, three inches thick. If we shut them, we won't have any fresh air at all; and if we leave them open, anybody can see in. The Mexicans seem to have very extraordinary notions of privacy, anyway."

"I don't like it at all," said Rose. "And with all these old women marching about,—but she seemed a nice sort of old woman, I must say,—and these open doors, and all, I'm quite nervous. You'd better shut them all tight, Van. It is such a big room that the air won't be very bad."

But Brown left the door in the corner open, and the first thing that he knew in the morning he was waking up and finding a serving-man gravely entering with an earthen jar of fresh water. The man said good morning, in a matter-of-fact way, and asked—as far as Brown could make out—if the Señor and

Señora had rested well, and if there was anything else that he could bring them.

Violet seemed rather surprised when Rose, in a delicate way, lodged a remonstrance against these intrusions.

"Oh, you need n't mind them," she said. "Old Margarita always goes into the oratory at night to say her prayers—she is a dear old thing. And if Juan does n't bring you fresh water in the morning, and see if you want anything, what are you going to do?"

Rose did not feel at liberty to speak about the one towel. She drew on her private stock. At the end of a week the one towel was removed, and a clean towel was put in its place. They were very elegant, in their way, these solitary towels; of beautiful linen, and ornamented with a good deal of handsome embroidery. Rose never quite succeeded in making up her mind as to whether they really were intended for use, or simply were fitting accessories to the bric-à-brac basin and pitcher.

In regard to the slop-bucket, Violet settled the matter promptly. "Just empty your basin out over the edge of the corridor," she said. "That's the way we always do, you know." And that was the way they did.

Another peculiarity of the household that struck the Americans forcibly was that at meals the women were given their food after the men. The first portion went to Mr. Mangan Brown, the next to Mr. Gamboge, and then the younger men, in turn, received their portions. After this the women, beginning with Mrs. Gamboge, were served. It made one feel like living in the Middle Ages, Rose said.

But with all the oddities and peculiarities of domestic life which they encountered, the underlying kindness and hearty hospitality of their entertainers made the Americans feel thoroughly sorry when the fortnight came to an end. It was a matter of some doubt, indeed, as to whether they would be permitted to leave at the end of this very short visit. Señor Carmine had counted upon having them with him for several months, he assured them; why could they not stay on? The summer was such a lovely season on the plateau—never hot, never cold; and all manner of delicious fruit to be gathered freshly every day. Why should they not remain?

But Señor Carmine yielded to the inevitable, and aided his wife in devising and arranging stores of all manner of good things to eat and drink for his departing guests to take with them for sustenance by the way. From the quantities of food provided for this purpose, anybody but a Mexican would have inferred that the party was about setting forth to cross an exceedingly wide desert, instead of upon a comfortable journey of eight hours by

rail, with very fair opportunities for sustaining life by stops at two reasonably good eating-stations.

The one member of the party who really was glad to leave the hacienda was Mr. Pemberton Logan Smith. Pem never had known two weeks so long as these two weeks had been. He had done his best to be as cheerful as possible, for he was a well-bred young man, with strong convictions in regard to the impropriety of exhibiting publicly his private griefs; but in spite of his best efforts he had not been wholly successful, so very much depended upon that answer which he was to receive when the two weeks were at an end. He had played a masterful part that day at Chapultepec, but would he be able to keep on playing it? Cármen loved him—she admitted it; but could he force her to give him her love? These were the questions which constantly were in his mind, constantly tormenting him with their varying answers and consequent shiftings from hopeful elation to desolating doubts and fears. Even to have desolation set in for a permanency was better, he thought, than that this racking uncertainty should endure. And so he was very glad when at last his face was set once more towards certainty and the City of Mexico.

Although the train did not arrive at the Colonia station until after 8 o'clock at night, Don Antonio was on hand to meet them, and had a little procession of carriages in readiness for their conveyance to their hotel. No one would have been surprised had he brought along a brass band. Had he happened to think of it, very likely he would.

He had planned one more expedition for them, he said; and hastened to add, fearing that the question of lack of time would be raised, that it was a very little one. It was only to go once more to the shrine of Guadalupe. They had been there once, but he feared that they had not drunk of the water of the Holy Well. Did they know that whoever drank of this water needs must return—no matter how far away they might stray into the world—to drink again? Therefore they must come with him and drink: so would he have assurance that they all would return.

Of course, an invitation of this gracious sort could not be refused; and so it was decided to defer the start northward for yet another day, and to go to Guadalupe on the following afternoon. Pem was well pleased with this arrangement, and especially with the fact, mentioned by Don Antonio incidentally, that it was to his niece that he owed the suggestion of assuring in this way the return of their American friends. Pem could not but believe that herein was ground for hope.

BUT from Cármen's face, when they all met the next afternoon in the Plaza, he could make nothing: her eyes were downcast, and her lips were firm. But it comforted him to see that the wearied, pained look, that had shocked him so when they last met at Chapultepec, had disappeared. During the short ride on the tramway she sat nearly opposite to him in the car, her eyes still cast down. But through the veil of her dark lashes he felt that she was looking at him earnestly.

As the church already had been visited, there was nothing to detain them from the immediate object of their pilgrimage. Therefore Don Antonio, gallantly escorting Mrs. Gamboe, led the way directly across the pretty plazuela, past the old parish church and so to the beautiful little chapel—the masterpiece of the architect Guerrero y Torres—that covers the Holy Well.

With something of the serious air of one who administers a religious rite, Don Antonio dipped up the water through the iron grating and served it to his American friends. As Pem drank, Cármen for an instant looked full upon him. It was a strange look: but again Pem believed that he had a right to hope.

When the ceremony was ended they mounted the stone stairway that winds up the Cerrito, to take a last look at the sunset light upon the snow mountains.

"Not a last look," Don Antonio correctly interposed. "You have drunk of the water of the Holy Well."

In Mexican fashion the gentlemen offered their hands to the ladies to assist them in the ascent. Pem gave his hand to Cármen; hers was very cold, and it trembled as it touched his.

Where the stairways from the opposite sides of the hill unite, on the little plateau before the stone screen, they paused to rest; and when the party moved on, passing beyond the screen, Pem took Cármen's hand, as though to follow, but gently detained her. He felt her hand tremble again. She withdrew it from his, and in obedience to his gesture seated herself beside him upon the stone bench. And so once more they were alone at sunset.

But now that the moment for which Pem had longed so earnestly had come, his fears entirely overmastered his hopes, and he did not dare to speak. He knew that this hour would decide his life for him. He remembered all that Cármen had urged to make clear to him that while she loved him she could not give him her love; he remembered how little substantial ground she had given him that day for believing that the conclusion which she had arrived at deliberately, and deliberately had stated a fortnight before, was to be reversed. And as these dreary thoughts

possessed him, hope slipped farther and farther away from his heart.

Cármen sat silently beside him. Her open hand rested upon the stone bench, not far from his, but he had not the courage to take it. Her eyes were turned eastward towards the snow mountains. High above the snow-capped peaks was a glory of red and golden cloud, but the mountains below were cold and colorless. To Pem's mind the White Woman seemed more than ever a dead, cold woman, half hidden beneath her shroud of snow. And as this dreary thought came into his mind, linking itself with the sorrowful thoughts already there, and by an allegory making the sorrow of them still more keen, there came from his lips a sob. Doubtless

there is no sound more pathetic than the sob of a strong man.

And then Pem felt a soft hand, not cold, but warm, in his; and at that instant a shifting of the clouds changed the current of the sunlight, and the White Woman was lit up by a ruddy, life-giving glow.

Pem's heart bounded. He raised his head, and his eyes met Cármen's—looking full at him now, bright through tears and full of love.

"Señor, Señor mio," said Cármen, as they rose at last from the stone bench, yet still looked eastward on the splendor of gold and crimson clouds and crimsoned snow, "it was here in Guadalupe Hidalgo that the treaty of peace between the conquered Mexicans and the conquering Americans was signed."

THE END.

Thomas A. Janvier.

ARMY HOSPITALS AND CASES.

MEMORANDA AT THE TIME, 1863-66.

BY WALT' WHITMAN.

[Of reminiscences of the Secession War, after the rest is said, it remains to give a few special words—in some respects the typical words of all, and the most definitive—of the army hospitals and samples of those that filled them, of the killed and wounded in action, and of soldiers who lingered afterward, from these wounds, or were laid up by disease or prostration. The general statistics have perhaps been printed already, but, as introductory to the incidents I am going to describe, they can bear to be briefly stated again. There were over 2,000,000 men (for all periods of enlistment, large and small) furnished to the Union army during the war, New York State furnishing nearly 500,000, which was the greatest number of any one State. The losses by disease, wounds, killed in action, accidents, etc. were altogether about 300,000, or approximating to that number. Over 6,000,000 cases were treated in the army hospitals. The number sounds strange, but it is true. More than two-thirds of the deaths were from prostration or disease. To-day there lie buried over 300,000 soldiers in the various national army cemeteries, more than half of them marked "unknown." In full mortuary statistics of the war the greatest deficiency arises from our not having the rolls, even as far as they were kept, of most of the Southern military prisons, a gap which probably both adds to, and helps to conceal, the indescribable horrors of those places. It is, however, certain that over 25,000 Union soldiers died in the

hands of the enemy.* And now, leaving all figures and their "sum totals," I feel sure a few genuine memoranda of such things, made at the time and on the spot, defective as they are, but with all the associations of those persons, scenes, and places brought back, will not only go directest to the right spot, but give a clearer and more actual sight of "army hospitals and cases" during that period than anything else. I begin with verbatim extracts from letters home to my mother in Brooklyn, the second year of the war.—W. W.]

Washington, Oct. 13, 1863.—There has been a new lot of wounded and sick arriving for the last three days. The first and second days, long strings of ambulances with the sick. Yesterday the worst, many with bad and bloody wounds, inevitably long neglected. I thought I was cooler and more used to it, but the sight of some cases brought tears into my eyes. I had the luck yesterday, however, to do lots of good. Had provided many nourishing articles for the men for another quarter, but, fortunately, had my stores where I could use them at once for these new-comers, as they arrived, faint, hungry, fagged out from their journey, with soiled clothes, and all bloody. I distributed these articles, gave partly to the nurses I knew, or to those in charge. As many as possible I fed myself.

* The latest official compilation (1885) shows the Union mortality to have been 359,528, of whom 29,498 died in Southern prisons.—EDITOR.

Then I found a lot of oyster soup handy, and bought it all at once.

It is the most pitiful sight, this, when the men are first brought in, from some camp hospital broke up, or a part of the army moving. These who arrived yesterday are cavalrymen. Our troops had fought like devils, but got the worst of it. They were Kilpatrick's cavalry; — were in the rear, part of Meade's retreat, and the reb cavalry, knowing the ground and taking a favorable opportunity, dashed in between, cut them off, and shelled them terribly. But Kilpatrick turned and brought them out, mostly. It was last Sunday.

Oct. 27, 1863.—If any of the soldiers I know (or their parents or folks) should call upon you,—as they are often anxious to have my address in Brooklyn,—you just use them as you know how, and if you happen to have pot-luck, and feel to ask them to take a bite, don't be afraid to do so. I have a friend, Thomas Neat, 2d New York Cavalry, wounded in leg, now home in Jamaica, on furlough; he will probably call. Then possibly a Mr. Haskell, or some of his folks, from western New York: he had a son died here, and I was with the boy a good deal. The old man and his wife have written me and asked me my Brooklyn address; he said he had children in New York, and was occasionally down there. When I come home I will show you some of the letters I get from mothers, sisters, fathers, etc. They will make you cry.

How the time passes away! To think it is over a year since I left home suddenly — and have mostly been down in front since. The year has vanished swiftly, and oh, what scenes I have witnessed during that time! And the war is not settled yet; and one does not see anything certain, or even promising, of a settlement. But I do not lose the solid feeling, in myself, that the Union triumph is assured, whether it be sooner or whether it be later, or whatever roundabout way we may be led there; and I find I don't change that conviction from any reverses we meet, nor delays, nor blunders. One realizes here in Washington the great labors, even negative ones, of Lincoln; — that it is a big thing to have just kept the United States from being thrown down and having its throat cut. I have not wavered or had any doubt of the issue since Gettysburg.

18th September, 1863.—Here, now, is a specimen hospital case: Lorenzo Strong, Co. A, 9th New York Cavalry (his brother, Horace L. Strong, Rochester, N. Y.), shot by a shell last Sunday; right leg amputated on the field. Sent up here Monday night, 14th.

Seemed to be doing pretty well till Wednesday noon, 16th, when he took a turn for the worse, and a strangely rapid and fatal termination ensued. Though I had much to do, I staid and saw it all. It was a death-picture characteristic of these soldiers' hospitals: the perfect specimen of physique,—one of the most magnificent I ever saw,—the convulsive spasms, and working of muscles, mouth, and throat. There are two good women nurses, one on each side. The doctor comes in and gives him a little chloroform. One of the nurses constantly fans him, for it is fearfully hot. He asks to be raised up, and they put him in a half-sitting posture. He called for "Mark" repeatedly, half-deliriously, all day. Life ebbs, runs now with the speed of a mill-race; his splendid neck, as it lays all open, works still, slightly; his eyes turn back. A religious person coming in offers a prayer, in subdued tones; around the foot of the bed, and in the space of the aisle, a crowd, including two or three doctors, several students, and many soldiers, has silently gathered. It is very still and warm, as the struggle goes on, and dwindles, a little more, and a little more — and then welcome oblivion, painlessness, death. A pause, the crowd drops away, a white bandage is bound around and under the jaw, the propping pillows are removed, the limpsy head falls down, the arms are softly placed by the side, all composed, all still — and the broad white sheet is thrown over everything.

April 10, 1864.—Unusual agitation all around concentrated here. Exciting times in Congress. The Copperheads are getting furious, and want to recognize the Southern Confederacy. "This is a pretty time to talk of recognizing such —," said a Pennsylvania officer in hospital to me to-day, "after what has transpired the last three years." After first Fredericksburg I felt discouraged myself, and doubted whether our rulers could carry on the war. But that has passed away. The war *must* be carried on. I would willingly go in the ranks myself if I thought it would profit more than as at present, and I don't know sometimes but I shall, as it is. Then there is certainly a strange, deep, fervid feeling formed or aroused in the land, hard to describe or name; it is not a majority feeling, but it will make itself felt. M., you don't know what a nature a fellow gets, not only after being a soldier a while, but after living in the sights and influences of the camps, the wounded, etc.—a nature he never experienced before. The stars and stripes, the tune of Yankee Doodle, and similar things, produce such an effect on a fellow as never before. I have seen them bring tears on some men's

cheeks, and others turn pale with emotion. I have a little flag (it belonged to one of our cavalry regiments), presented to me by one of the wounded; it was taken by the Secesh in a fight, and rescued by our men in a bloody skirmish following. It cost three men's lives to get back that four-by-three flag—to tear it from the breast of a dead rebel—for the name of getting their little “rag” back again. The man that secured it was very badly wounded, and they let him keep it. I was with him a good deal; he wanted to give me some keepsake, he said,—he didn't expect to live,—so he gave me that flag. The best of it all is, dear M., there is n't a regiment, cavalry or infantry, that would n't do the like, on the like occasion.

April 12.—I will finish my letter this morning; it is a beautiful day. I was up in Congress very late last night. The House had a

very excited night session about expelling the men that proposed recognizing the Southern Confederacy. You ought to hear (as I do) the soldiers talk; they are excited to madness. We shall probably have hot times here, not in the military fields alone. The body of the army is true and firm as the North Star.

May 6, 1864.—M., the poor soldier with diarrhea is still living, but, oh, what a looking object! Death would be a relief to him—he cannot last many hours. Cunningham, the Ohio soldier, with leg amputated at thigh, has picked up beyond expectation; now looks indeed like getting well. [He died a few weeks afterward.] The hospitals are very full.* I am very well indeed. Hot here to-day.

May 23, 1864.—Sometimes I think that should it come when it *must*, to fall in battle, one's anguish over a son or brother killed might

* *Hospitals Ensemble.* August, September, and October, 1863.—I am in the habit of going to all, and to Fairfax Seminary, Alexandria, and over Long Bridge to the great Convalescent Camp. The journals publish a regular directory of them—a long list. As a specimen of almost any one of the larger of these hospitals, fancy to yourself a space of three to twenty acres of ground, on which are grouped ten or twelve very large wooden barracks, with, perhaps, a dozen or twenty, and sometimes more than that number, small buildings, capable altogether of accommodating from 500 to 1000 or 1500 persons. Sometimes these wooden barracks, or wards, each of them perhaps from 100 to 150 feet long, are ranged in a straight row, evenly fronting the street; others are planned so as to form an immense V; and others again are ranged around a hollow square. They make altogether a huge cluster, with the additional tents, extra wards for contagious diseases, guard-houses, sutler's stores, chaplain's house; in the middle will probably be an edifice devoted to the offices of the surgeon in charge and the ward surgeons, principal attachés, clerks, etc. The wards are either lettered alphabetically, Ward G, Ward K, or else numerically, 1, 2, 3, etc. Each has its ward surgeon and corps of nurses. Of course, there is, in the aggregate, quite a muster of employees, and over all the surgeon in charge. Here in Washington, when these army hospitals are all filled (as they have been already several times), they contain a population more numerous in itself than the whole of the Washington of ten or fifteen years ago. Within sight of the Capitol, as I write, are some thirty or forty such collections, at times holding from 50,000 to 70,000 men. Looking from any eminence and studying the topography in my rambles, I use them as landmarks. Through the rich August verdure of the trees, see that white group of buildings off yonder in the outskirts; then another cluster half a mile to the left of the first; then another a mile to the right, and another a mile beyond, and still another between us and the first. Indeed, we can hardly look in any direction but these clusters are dotting the landscape and environs. That little town, as you might suppose it, off there on the brow of a hill, is indeed a town, but of wounds, sickness, and death. It is Finley Hospital, north-east of the city, on Kendall Green, as it used to be called. That other is Campbell Hospital. Both are large establishments. I have known these two alone to have from 2000 to 2500 inmates. Then there is Carver Hospital, larger still, a walled and military city regularly laid out, and guarded by squads of sentries.

Again, off east, Lincoln Hospital, a still larger one; and, half a mile farther, Emory Hospital. Still sweeping the eye around down the river towards Alexandria, we see, to the right, the locality where the Convalescent Camp stands, with its 5,000, 8,000, or sometimes 10,000 inmates. Even all these are but a portion. The Harewood, Mount Pleasant, Armory Square, Judiciary Hospitals, are some of the rest, and all large collections.

Summer of 1864.—I am back again in Washington, on my regular daily and nightly rounds. Of course there are many specialties. Dotting a ward here and there are always cases of poor fellows, long suffering under obstinate wounds, or weak and disheartened from typhoid fever, or the like; marked cases, needing special and sympathetic nourishment. These I sit down and either talk to or silently cheer them up. They always like it hugely (and so do I). Each case has its peculiarities, and needs some new adaptation. I have learnt to thus conform—learnt a good deal of hospital wisdom. Some of the poor young chaps, away from home for the first time in their lives, hunger and thirst for affection; this is sometimes the only thing that will reach their condition. The men like to have a pencil, and something to write in. I have given them cheap pocket-diaries, and almanacs for 1864, interleaved with blank paper. For reading I generally have some old pictorial magazines or story-papers—they are always acceptable. Also the morning or evening papers of the day. The best books I do not give, but lend to read through the wards, and then take them to others, and so on; they are very punctual about returning the books. In these wards, or on the field, as I thus continue to go round, I have come to adapt myself to each emergency, after its kind or call, however trivial, however solemn, every one justified and made real under its circumstances; not only visits and cheering talk and little gifts, not only washing and dressing wounds (I have some cases where the patient is unwilling any one should do this but me), but passages from the Bible, expounding them, prayer at the bedside, explanations of doctrine, etc. (I think I see my friends smiling at this confession, but I was never more in earnest in my life.) In camp and everywhere, I was in the habit of reading or giving recitations to the men. They were very fond of it, and liked declamatory poetical pieces. We would gather in a large group by ourselves, after supper, and spend the time in such readings, or in talking, and occasionally by an amusing game called the game of twenty questions.

be tempered with much to take the edge off. Lingering and extreme suffering from wounds or sickness seem to me far worse than death in battle. I can honestly say the latter has no terrors for me, as far as I myself am concerned. Then I should say, too, about death in war, that our feelings and imaginations make a thousand times too much of the whole matter. Of the many I have seen die, or known of, the past year, I have not seen or known one who met death with terror. In most cases I should say it was a welcome relief and release.

Yesterday I spent a good part of the afternoon with a young soldier of seventeen, Charles Cutter, of Lawrence, Massachusetts (1st Massachusetts Heavy Artillery, Battery M); he was brought to one of the hospitals mortally wounded in abdomen. Well, I thought to myself, as I sat looking at him, it ought to be a relief to his folks if they could see how little he really suffered. He lay very placid, in a half lethargy, with his eyes closed. As it was extremely hot, and I sat a good while silently fanning him and wiping the sweat, at length he opened his eyes quite wide and clear and looked inquiringly around. I said, "What is it, my boy? Do you want anything?" He answered quietly, with a good-natured smile, "Oh, nothing; I was only looking around to see who was with me." His mind was somewhat wandering, yet he lay in an evident peacefulness that sanity and health might have envied. I had to leave for other engagements. He died, I heard afterward, without any special agitation, in the course of the night.

Washington, May 26, 1863.—M., I think something of commencing a series of lectures, readings, talks, etc. through the cities of the North, to supply myself with funds for hospital ministrations. I do not like to be so beholden to others; I need a pretty free supply of money, and the work grows upon me and fascinates me. It is the most magnetic as well as terrible sight: the lots of poor wounded and helpless men depending so much, in one ward or another, upon my soothing or talking to them, or rousing them up a little, or perhaps petting or feeding them their dinner or supper (here is a patient, for instance, wounded in both arms), or giving some trifle for a novelty or change—anything, however trivial, to break the monotony of those hospital hours.

It is curious: when I am present at the most appalling scenes, deaths, operations, sickening wounds (perhaps full of maggots), I keep cool and do not give out or budge, although my sympathies are very much excited; but often, hours afterward, perhaps when I am home, or

out walking alone, I feel sick, and actually tremble, when I recall the case again before me.

[The following memoranda describe some of the last cases and hospital scenes of the war, from my own observation.]

Two brothers, one South, one North.—*May 28-29, 1865.*—I staid to-night a long time by the bedside of a new patient, a young Baltimorean, aged about nineteen years, W. S. P. (2d Maryland, Southern), very feeble, right leg amputated, can't sleep; has taken a great deal of morphine, which, as usual, is costing more than it comes to. Evidently very intelligent and well-bred; very affectionate; held on to my hand, and put it by his face, not willing to let me leave. As I was lingering, soothing him in his pain, he says to me suddenly: "I hardly think you know who I am. I don't wish to impose upon you—I am a rebel soldier." I said I did not know that, but it made no difference. Visiting him daily for about two weeks after that, while he lived (death had marked him, and he was quite alone), I loved him much, always kissed him, and he did me. In an adjoining ward I found his brother, an officer of rank, a Union soldier, a brave and religious man (Colonel Clifton K. Prentiss, 6th Maryland infantry, Sixth Corps, wounded in one of the engagements at Petersburg, April 2, lingered, suffered much, died in Brooklyn, August 20, 1865). It was in the same battle both were hit. One was a strong Unionist, the other Secesh; both fought on their respective sides, both badly wounded, and both brought together here after a separation of four years. Each died for his cause.

Sunday Afternoon, July 30.—Passed this afternoon among a collection of unusually bad cases, wounded and sick Secession soldiers, left upon our hands. I spent the previous Sunday afternoon there also. At that time two were dying. Two others have died during the week. Several of them are partly deranged. To-day I went around among them elaborately. Poor boys, they all needed to be cheered up. As I sat down by any particular one, the eyes of all the rest in the neighboring cots would fix upon me, and remain steadily riveted as long as I sat within their sight. Nobody seemed to wish anything special to eat or drink. The main thing asked for was postage stamps, and paper for writing. I distributed all the stamps I had. Tobacco was wanted by some.

One called me over to him and asked me in a low tone what denomination I belonged to. He said he was a Catholic—wished to find some one of the same faith—wanted some

good reading. I gave him something to read, and sat down by him a few minutes. Moved around with a word for each. They were hardly any of them personally attractive cases, and no visitors come here. Of course they were all destitute of money. I gave small sums to two or three, apparently the most needy. The men are from quite all the Southern States, Georgia, Mississippi, Louisiana, etc.

Wrote several letters. One for a young fellow named Thomas J. Byrd, with bad wound and diarrhea. Was from Russell County, Alabama; been out four years. Wrote to his mother; had neither heard from her nor written to her in nine months. Was taken prisoner last Christmas, in Tennessee; sent to Nashville, then to Camp Chase, Ohio, and kept there a long time; all the while not money enough to get paper and postage stamps. Was paroled, but on his way home the wound took gangrene; had diarrhea also; had evidently been very low. Demeanor cool and patient. A dark-skinned, quaint young fellow, with strong southern idiom; no education.

Another letter, for John W. Morgan, aged 18, from Shellot, Brunswick County, North Carolina; been out nine months; gun-shot wound in right leg, above knee; also diarrhea; wound getting along well; quite a gentle, affectionate boy; wished me to put in the letter for his mother to kiss his little brother and sister for him. [I put strong envelopes on these, and two or three other letters, directed them plainly and fully, and dropped them in the Washington post-office the next morning myself.]

The large ward I am in is used for secession soldiers exclusively. One man, about forty years of age, emaciated with diarrhea, I was attracted to, as he lay with his eyes turned up, looking like death. His weakness was so extreme that it took a minute or so, every time, for him to talk with anything like consecutive meaning; yet he was evidently a man of good intelligence and education. As I said anything, he would lie a moment perfectly still, then, with closed eyes, answer in a low, very slow voice, quite correct and sensible, but in a way and tone that wrung my heart. He had a mother, wife, and child living (or probably living) in his home in Mississippi. It was long, long since he had seen them. Had he caused a letter to be sent them since he got here in Washington? No answer. I repeated the question, very slowly and soothingly. He could not tell whether he had or not — things of late seemed to him like a dream. After waiting a moment, I said: "Well, I am going to walk down the ward a moment, and when I come back you can tell me. If you have not written, I will sit down and write." A few minutes

after, I returned; he said he remembered now that some one had written for him two or three days before. The presence of this man impressed me profoundly. The flesh was all sunken on face and arms; the eyes low in their sockets and glassy, and with purple rings around them. Two or three great tears silently flowed out from the eyes, and rolled down his temples (he was doubtless unused to be spoken to as I was speaking to him). Sickness, imprisonment, exhaustion, etc. had conquered the body; yet the mind held mastery still, and called even wandering remembrance back.

There are some fifty Southern soldiers here; all sad, sad cases. There is a good deal of scurvy. I distributed some paper, envelopes, and postage stamps, and wrote addresses full and plain on many of the envelopes.

I returned again Tuesday, August 1, and moved around in the same manner a couple of hours.

September 22, 1865.—Afternoon and evening at Douglas Hospital to see a friend belonging to 2d New York Artillery (Hiram W. Frazee, Serg't), down with an obstinate compound fracture of left leg received in one of the last battles near Petersburg. After sitting a while with him, went through several neighboring wards. In one of them found an old acquaintance transferred here lately, a rebel prisoner, in a dying condition. Poor fellow, the look was already on his face. He gazed long at me. I asked him if he knew me. After a moment he uttered something, but inarticulately. I have seen him off and on for the last five months. He has suffered very much; a bad wound in left leg, severely fractured, several operations, cuttings, extractions of bone, splinters, etc. I remember he seemed to me, as I used to talk with him, a fair specimen of the main strata of the Southerners, those without property or education, but still with the stamp which comes from freedom and equality. I liked him; Jonathan Wallace, of Hurd County, Georgia, age 30 (wife, Susan F. Wallace, Houston, Hurd County, Georgia). [If any good soul of that county should see this, I hope he will send her word.] Had a family; had not heard from them since taken prisoner, now six months. I had written for him, and done trifles for him, before he came here. He made no outward show, was mild in his talk and behavior, but I knew he worried much inwardly. But now all would be over very soon. I half sat upon the little stand near the head of the bed. Wallace was somewhat restless. I placed my hand lightly on his forehead and face, just sliding it over the surface. In a moment or so he fell into a calm, regular-breathing lethargy or sleep, and remained so while I sat there. It was dark, and the lights were lit. I hardly

know why (death seemed hovering near), but I staid nearly an hour. A Sister of Charity, dressed in black, with a broad white linen bandage around her head and under her chin, and a black crape over all and flowing down from her head in long wide pieces, came to him, and moved around the bed. She bowed low and solemn to me. For some time she moved around there noiseless as a ghost, doing little things for the dying man.

December, 1865.—The only remaining hospital is now "Harewood," out in the woods, north-west of the city. I have been visiting there regularly every Sunday during these two months.

January 24, 1866.—Went out to Harewood early to-day, and remained all day.

Sunday, February 4, 1866.—Harewood Hospital again. Walked out this afternoon (bright, dry, ground frozen hard) through the woods. Ward 6 is filled with blacks, some with wounds, some ill, two or three with limbs frozen. The boys made quite a picture sitting round the stove. Hardly any can read or write. I write for three or four, direct envelopes, give some tobacco, etc.

Joseph Winder, a likely boy, aged twenty-three, belongs to 10th Colored Infantry (now in Texas); is from Eastville, Virginia. Was a slave; belonged to Lafayette Homeston. The master was quite willing he should leave. Joined the army two years ago; has been in one or two battles. Was sent to hospital with rheumatism. Has since been employed as cook. His parents at Eastville; he gets letters from them, and has letters written to them by a

friend. Many black boys left that part of Virginia and joined the army; the 10th, in fact, was made up of Virginia blacks from thereabouts. As soon as discharged is going back to Eastville to his parents and home, and intends to stay there.

Thomas King, formerly 2d District Colored Regiment, discharged soldier, Company E, lay in a dying condition; his disease was consumption. A Catholic priest was administering extreme unction to him. (I have seen this kind of sight several times in the hospitals; it is very impressive.)

Harewood, April 29, 1866. Sunday afternoon.—Poor Joseph Swiers, Company H, 155th Pennsylvania, a mere lad (only eighteen years of age); his folks living in Reedsburgh, Pennsylvania. I have known him now for nearly a year, transferred from hospital to hospital. He was badly wounded in the thigh at Hatcher's Run, February 6, 1865.

James E. Ragan, Atlanta, Georgia; 2d United States Infantry. Union folks. Brother impressed, deserted, died; now no folks, left alone in the world, is in a singularly nervous state; came in hospital with intermittent fever.

Walk slowly around the ward, observing, and to see if I can do anything. Two or three are lying very low with consumption, cannot recover; some with old wounds; one with both feet frozen off, so that on one only the heel remains. The supper is being given out: the liquid called tea, a thick slice of bread, and some stewed apples.

That was about the last I saw of the regular army-hospitals.

Walt Whitman.

RESTLESSNESS.

(Written before visiting Florence.)

WOULD I had waked this morn where Florence smiles,
 Abloom with beauty, a white rose full-blown,
 Yet rich in sacred dust, in storied stone
 Precious past all the wealth of Indian isles.
 From olive-hoary Fiesole to feed
 On Brunelleschi's dome my hungry eye,
 And see against the lotos-colored sky
 Spring the slim belfry graceful as a reed;
 To kneel upon the ground where Dante trod;
 To breathe the air of immortality
 From Angelo and Raphael,—to be,
 Each sense new-quicken'd by a demi-god;
 To hear the liquid Tuscan speech at whiles
 From citizen and peasant; to behold
 The heaven of Leonardo washed with gold.—
 Would I had waked this morn where Florence smiles!

Emma Lazarus.

FRONTIER TYPES.

BY THEODORE ROOSEVELT.

ILLUSTRATIONS BY FREDERIC REMINGTON.

THE old race of Rocky Mountain hunters and trappers, of reckless, dauntless Indian fighters, is now fast dying out. Yet here and there these restless wanderers of the untrodden wilderness still linger, in wooded fastnesses so inaccessible that the miners have not yet explored them, in

mountain valleys so far off that no ranchman has yet driven his herds thither. To this day many of them wear the fringed tunic or hunting-shirt, made of buckskin, or homespun, and belted in at the waist — the most picturesque and distinctively national dress ever worn in America. It was the dress in which Daniel Boone was clad when he first passed through the trackless forests of the Alleghanies and penetrated into the heart of Kentucky, to enjoy such hunting as no man of his race had ever had before; it was the dress worn by grim old Davy Crockett when he fell at the Alamo. The wild soldiery of the backwoods wore it when they marched to victory over Ferguson and Pakenham, at King's Mountain and New Orleans; when they conquered the French towns of the Illinois; and when they won at the cost of Red Eagle's warriors the bloody triumph of the Horseshoe Bend.

These old-time hunters have been the fore-runners of the white advance throughout all our Western land. Soon after the beginning of the present century they boldly struck out beyond the Mississippi, steered their way across the flat and endless seas of grass, or pushed up the valleys of the great lonely rivers, crossed the passes that wound among the towering peaks of the Rockies, toiled over the melancholy wastes of sage brush and alkali, and at last, breaking through the gloomy woodland that belts the coast, looked out on the heaving waves of the greatest of all the oceans. They lived for months, often for years, among the Indians, now as friends, now as foes, warring, hunting, and marrying

with them; they acted as guides for exploring parties, as scouts for the soldiers who from time to time were sent against the different hostile tribes. At long intervals they came into some frontier settlement or some fur company's fort, posted in the heart of the wilderness, to dispose of their bales of furs, or to replenish their stock of ammunition and purchase a scanty supply of coarse food and clothing.

From that day to this they have not changed their way of life. But there are not many of them left now. The basin of the Upper Missouri was their last stronghold, being the last great hunting-ground of the Indians, with whom the white trappers were always fighting and bickering, but who nevertheless by their presence protected the game that gave the trappers their livelihood. My cattle were among the very first to come into the land, at a time when the buffalo and the beaver still abounded, and then the old hunters were common. Many a time I have hunted with them, spent the night in their smoky cabins, or had them as guests at my ranch. But in a couple of years after the influx of the cattle-men the last herds of the buffalo were destroyed, and the beaver were trapped out of all the plains' streams. Then the hunters vanished likewise, save that here and there one or two still remain in some nook or out-of-the-way corner. The others wandered off restlessly over the land — some to join their brethren in the Cœur d'Alène or the northern Rockies, others to the coast ranges or to far-away Alaska. Moreover, their ranks were soon thinned by death, and the places of the dead were no longer taken by new recruits. They led hard lives, and the unending strain of their toilsome and dangerous existence shattered even such iron frames as theirs. They were killed in drunken brawls, or in nameless fights with roving Indians; they died by one of the thousand accidents incident to the business of their lives — by flood or quicksand, by cold or starvation, by the stumble of a horse or a foot-slip on the edge of a cliff; they perished by diseases brought on by terrible privation and aggravated by the savage orgies with which it was varied.

Yet there was not only much that was attractive in their wild, free, reckless lives, but

there was also very much good about the men themselves. They were—and such of them as are left still are—frank, bold, and self-reliant to a degree. They fear neither man, brute, nor element. They are generous and hospitable; they stand loyally by their friends, and pursue their enemies with bitter and vindictive hatred. For the rest, they differ among themselves in their good and bad points even more markedly than do men in civilized life, for out on the border virtue and wickedness alike take on very pronounced colors. A man who in civilization would be merely a back-biter becomes a murderer on the frontier; and, on the other hand, he who in the city would do nothing more than bid you a cheery good-morning shares his last bit of sun-jerked venison with you when both are threatened by starvation in the wilderness. One hunter may be a dark-browed, evil-eyed ruffian, ready to kill cattle or run off horses without hesitation, who if game fails will at once, in Western phrase, “take to the road”—that is, become a highwayman. The next is perhaps a quiet, kindly, simple-hearted man, law-abiding, modestly unconscious of the worth of his own fearless courage and iron endurance, always faithful to his friends, and full of chivalric and tender loyalty to women.

The hunter is the arch-type of freedom. His well-being rests in no man's hands save his own. He chops down and hews out the logs for his hut, or perhaps makes merely a rude dug-out in the side of a hill, with a skin roof, or skin flaps for the door. He buys a little flour and salt, and in times of plenty also sugar and tea; but not much, for it must all be carried hundreds of miles on the backs of his shaggy pack-ponies. In one corner of the hut, a bunk covered with deer-skins forms his bed; a kettle and a frying-pan may be all his cooking utensils. When he can get no fresh meat he falls back on his stock of jerked venison, dried in long strips over the fire or in the sun.

Most of the trappers are Americans, but there are some Frenchmen and half-breeds among them. Both of the last, if on the plains, occasionally make use of queer wooden carts, very rude in shape, with stout wheels that make a most doleful squeaking. In old times they all had Indian wives; but nowadays those who live among and intermarry with the Indians are looked down upon by the other frontiersmen, who contemptuously term them “squaw-men.” All of them depend upon their rifles only for food and for self-defense, and make their living by trapping, peltries being very valuable and yet not bulky. They are good game shots, especially the pure Americans; although, of course, they are very boast-

ful, and generally stretch the truth tremendously in telling about their own marksmanship. Still they often do very remarkable shooting, both for speed and accuracy. One of their feats, that I never could learn to copy, is to make excellent shooting after nightfall. Of course all this applies only to the regular hunters; not to the numerous pretenders who hang around the outskirts of the towns to try to persuade unwary strangers to take them for guides.

On one of my trips to the mountains I happened to come across several old-style hunters at the same time. Two were on their way out of the woods, after having been all winter and spring without seeing a white face. They had been lucky, and their battered pack-saddles carried bales of valuable furs—fisher, sable, otter, mink, beaver. The two men, though fast friends and allies for many years, contrasted oddly. One was a short, square-built, good-humored Kanuck, always laughing and talking, who interlarded his conversation with a singularly original mixture of the most villainous French and English profanity. His partner was an American, gray-eyed, tall and straight as a young pine, with a saturnine, rather haughty face, and proud bearing. He spoke very little, and then in low tones, never using an oath; but he showed now and then a most unexpected sense of dry humor. Both were marvels of bronzed and rugged strength. Neither had the slightest touch of the bully in his nature; they treated others with the respect that they exacted for themselves. They bore an excellent reputation as being not only highly skilled in woodcraft and the use of the rifle, but also men of tried courage and strict integrity, whose word could be always implicitly trusted.

I had with me at the time a hunter who, though their equal as marksman or woodsman, was their exact opposite morally. He was a pleasant companion and useful assistant, being very hard-working, and possessing a temper that never was ruffled by anything. He was also a good-looking fellow, with honest brown eyes; but he no more knew the difference between right and wrong than did Adam before the fall. Had he been at all conscious of his wickedness, or had he possessed the least sense of shame, he would have been unbearable as a companion; but he was so perfectly pleasant and easy, so good-humoredly tolerant of virtue in others, and he so wholly lacked even a glimmering suspicion that murder, theft, and adultery were matters of anything more than individual taste, that I actually grew to be rather fond of him. He never related any of his past deeds of wickedness as matters either for boastfulness or for

A FUGITIVE.

A FRENCH-CANADIAN TRAPPER.

regret; they were simply narrated incidentally in the course of conversation. Thus once, in speaking of the profits of his different enterprises, he casually mentioned making a good deal of money as a Government scout in the South-west by buying cartridges from some negro troops at a cent apiece and selling them to the hostile Apaches for a dollar each. His conduct was not due to sympathy with the Indians, for it appeared that later on he had taken part in massacring some of these same Apaches when they were prisoners. He brushed aside as irrelevant one or two questions which I put to him: matters of sentiment were not to be mixed up with a purely mercantile speculation. Another time we were talking of the curious angles at which bullets sometimes fly off when they ricochet. To illustrate the matter he related an experience which I shall try to give in his own words:

"One time, when I was keeping a saloon down in New Mexico, there was a man owed me a grudge. Well, he took sick of the smallpox, and the doctor told him he'd sure die, and he said if that was so he reckoned he'd kill me first. So he come a-riding in with his gun [in the West a revolver is generally called

a gun] and begun shooting; but I hit him first, and away he rode. I started to get on my horse to follow him; but there was a little Irishman there who said he'd never killed a man, and he begged hard for me to give him my gun and let him go after the other man and finish him. So I let him go; and when he caught up, blamed if the little cuss did n't get so nervous that he fired off into the ground, and the darned bullet struck a crowbar, and glanced up, and hit the other man square in the head and killed him! Now, that *was* a funny shot, was n't it?"

The fourth member of our party round the camp-fire that night was a powerfully built trapper, partly French by blood, who wore a gayly colored capote, or blanket-coat, a greasy fur cap, and moccasins. He had grizzled hair, and a certain uneasy, half-furtive look about the eyes. Once or twice he showed a curious reluctance about allowing a man to approach him suddenly from behind. Altogether his actions were so odd that I felt some curiosity to learn his history. It turned out that he had been through a rather uncanny experience the winter before. He and another man had gone into a remote basin, or inclosed valley, in the heart of the mountains, where game

was very plentiful; indeed, it was so abundant that they decided to pass the winter there. Accordingly they put up a log-cabin, working hard, and merely killing enough meat for their immediate use. Just as it was finished winter set in with tremendous snow-storms. Going out to hunt, in the first lull, they found, to their consternation, that every head of game had left the valley. Not an animal was to be found therein; they had abandoned it for their winter haunts. The outlook for the two adventurers was appalling. They were afraid of trying to break out through the deep snow-drifts, and starvation stared them in the face if they staid. The man that I met had his dog with him. They put themselves on very short commons, so as to use up their flour as slowly as possible, and hunted unweariedly, but saw nothing. Soon a violent quarrel broke out between them. The other man, a fierce, sullen fellow, insisted that the dog should be killed, but the owner was exceedingly attached to it, and refused. For a couple of weeks they spoke no word to each other, though cooped in the little narrow pen of logs. Then one night the owner of the dog was awakened by the animal crying out; the other man had

tried to kill it with his knife, but failed. The provisions were now almost exhausted, and the two men were glaring at each other with the rage of maddened, ravening hunger. Neither dared to sleep, for fear that the other would kill him. Then the one who owned the dog at last spoke, and proposed that, to give each a chance for his life, they should separate. He would take half of the handful of flour that was left and start off to try to get home; the other should stay where he was; and if he tried to follow the first, he was warned that he would be shot without mercy. A like fate was to be the portion of the wanderer if driven to return to the hut. The arrangement was agreed to and the two men separated, neither daring to turn his back while they were within rifle-shot of each other. For two days the one who went off toiled on with weary weakness through the snow-drifts. Late on the second afternoon, as he looked back from a high ridge, he saw in the far distance a black speck against the snow, coming along on his trail. His companion was dogging his footsteps. Immediately he followed his own trail back a little and lay in ambush. At dusk his companion came stealthily up, rifle in hand, peering cautiously ahead, his drawn face showing the starved, eager ferocity of a wild beast, and the man he was hunting shot him down exactly as if he had been one. Leaving the body where it fell, the wanderer continued his journey, the dog staggering painfully behind him. The next evening he baked his last cake and divided it with the dog. In the morning, with his belt drawn still tighter round his skeleton body, he once more set out, with apparently only a few hours of dull misery between him and death. At noon he crossed the track of a huge timber-wolf; instantly the dog gave tongue, and, rallying its strength, ran along the trail. The man struggled after. At last his strength gave out and he sat down to die; but while sitting still, slowly stiffening with the cold, he heard the dog baying in the woods. Shaking off his mortal numbness, he crawled towards the sound, and found the wolf over the body of a deer that he had just killed, and keeping the dog from it. At the approach of the new assailant the wolf sullenly drew off, and man and dog tore the raw deer-flesh with hideous eagerness. It made them very sick for the next twenty-four hours; but, lying by the carcass for two or three days, they recovered strength. A week afterwards the trapper reached a

miner's cabin in safety. There he told his tale, and the unknown man who alone might possibly have contradicted it lay dead in the depths of the wolf-haunted forest.

The cowboys, who have supplanted these old hunters and trappers as the typical men of the plains, themselves lead lives that are almost as full of hardship and adventure. The unbearable cold of winter sometimes makes the small outlying camps fairly uninhabitable if fuel runs short; and if the line-riders are caught in a blizzard while making their way to the home ranch, they are lucky if they get off with nothing worse than frozen feet and faces.

They are, in the main, hard-working, faithful fellows, but of course are frequently obliged to get into scrapes through no fault of their own. Once, while out on a wagon trip, I got caught while camped by a spring on the prairie, through my horses all straying. A few miles off was the camp of two cowboys, who were riding the line for a great Southern cow-outfit. I did not even know their names, but happening to pass by them I told of my loss, and the day after they turned up with the missing horses, which they had been hunting for twenty-four hours. All I could do in return was to give them some reading-matter—something for which the men in these lonely camps are always grateful. Afterwards I spent a day or two with my new friends, and we became quite intimate. They were Texans. Both were quiet, clean-cut, pleasant-spoken young fellows, who did not even swear, except

THE OLD TRAPPER.

DISSOLUTE COW-PUNCHERS.

under great provocation;—and there can be no greater provocation than is given by a “mean” horse or a refractory steer. Yet, to my surprise, I found that they were, in a certain sense, fugitives from justice. They were complaining of the extreme severity of the winter weather, and mentioned their longing to go back to the South. The reason they could not was that the summer before they had taken part in a small civil war in one of the wilder counties of New Mexico. It had originated in a quarrel between two great ranches over their respective water rights and range rights—a quarrel of a kind rare among pastoral peoples since the days when the herdsmen of Lot and Abraham strove together for the grazing lands round the mouth of the Jordan. There were collisions between bands of armed cowboys, the cattle were harried from the springs, outlying camps were burned down, and the sons of the rival owners fought each other to the death with bowie-knife and revolver when they met at the drinking-booths

of the squalid towns. Soon the smoldering jealousy which is ever existent between the Americans and Mexicans of the frontier was aroused, and when the original cause of quarrel was adjusted, a fierce race struggle took its place. It was soon quelled by the arrival of a sheriff’s strong posse and the threat of interference by the regular troops, but not until after a couple of affrays, each attended with bloodshed. In one of these the American cowboys of a certain range, after a brisk fight, drove out the Mexican *vagueros* from among them. In the other, to avenge the murder of one of their number, the cowboys gathered from the country round about and fairly stormed the “Greaser”—that is, Mexican—village where the murder had been committed, killing four of the inhabitants. My two friends had borne a part in this last affair. They were careful to give a rather cloudy account of the details, but I gathered that one of them was “wanted” as a participant, and the other as a witness.

However, they were both good fellows, and probably their conduct was justifiable, at least according to the rather fitful lights of the border. While sitting up late with them, around the sputtering fire, they became quite confidential. At first our conversation touched only the usual monotonous round of subjects worn threadbare in every cow-camp. A bunch of steers had been seen traveling over the scoria buttes to the head of Elk Creek; they were mostly Texan *doughgies*,—a name I have never seen written; it applies to young immigrant cattle,—but there were some of the Hash-Knife four-year-olds among them. A stray horse with a blurred brand on the left hip had just joined the bunch of saddle-ponies. The red F. V. cow, one of whose legs had been badly bitten by a wolf, had got mired down in an alkali spring, and when hauled out had charged upon her rescuer so viciously that he barely escaped. Sawback, the old mule, was getting over the effects of the rattlesnake bite. The river was going down, but the fords were still bad, and the quicksand at the Custer Trail crossing had worked along so that wagons had to be taken over opposite the blasted cottonwood. One of the men had seen a Three-Seven-B rider who had just left the Green River round-up, and who brought news that they had found some cattle on the reservation, and were now holding about twelve hundred head

on the big brushy bottom below Rainy Butte. Bronco Jim, our local flash rider, had tried to ride the big bald-faced sorrel belonging to the Oregon horse-outfit, and had been bucked off and his face smashed in. This piece of information of course drew forth much condemnation of the unfortunate Jim's equestrian skill. It was at once agreed that he "was n't the sure-enough bronco-buster he thought himself," and he was compared very unfavorably to various heroes of the quirt and spurs who lived in Texas and Colorado; for the best rider, like the best hunter, is invariably either dead or else a resident of some other district.

These topics having been exhausted, we discussed the rumor that the vigilantes had given notice to quit to two men who had just built a shack at the head of the Little Dry, and whose horses included a suspiciously large number of different brands, most of them blurred. Then our conversation became more personal, and they asked if I would take some letters to post for them. Of course I said yes, and two letters—evidently the product of severe manual labor—were produced. Each was directed to a girl; and my companions, now very friendly, told me that they both had sweethearts, and for the next hour I listened to a full account of their charms and virtues.

But it is not often that plainsmen talk so easily. They are rather reserved, especially

A FIGHT IN THE STREET.

"DANCE HIGHER — DANCE FASTER."

to strangers; and are certain to look with dislike on any man who, when they first meet him, talks a great deal. It is always a good plan, if visiting a strange camp or ranch, to be as silent as possible.

Another time, at a ranch not far from my own, I found among the cowboys gathered for the round-up two Bible-reading Methodists, who fearlessly lived up to their faith but did not obtrude their opinions on any one else, and were first-class workers, so that they had no trouble with the other men. Associated with them were two or three blear-eyed, slit-mouthed ruffians, who were as loose of tongue as of life.

Generally some form of stable government is provided for the counties as soon as their population has become at all fixed, the frontiersmen showing their national aptitude for organization. Then lawlessness is put down pretty effectively. For example, as soon as we organized the government of Medora — an excessively unattractive little hamlet, the county-seat of our huge, scantily settled county — we elected some good officers, built a log jail, prohibited all shooting in the streets, and enforced the prohibition, etc.

Up to that time there had been a good deal of lawlessness of one kind or another, only checked by an occasional piece of individual retribution or by a sporadic outburst of vigilance committee work. In such a society the desperadoes of every grade flourish. Many are merely ordinary rogues and swindlers, who rob and cheat on occasion, but are dangerous only when led by some villain of real intel-

lectual power. The gambler, with hawk eyes and lissom fingers, is scarcely classed as a criminal; indeed, he may be a very public-spirited citizen. But as his trade is so often plied in saloons, — and even if, as sometimes happens, he does not cheat, many of his opponents are certain to attempt to do so, — he is of necessity obliged to be skillful and ready with his weapon, and gambling rows are very common. Cowboys lose much of their money to gamblers; it is with them hard come and light go, for they exchange the wages of six months' grinding toil and lonely peril for three days' whooping carousal, spending their money on poisonous whisky or losing it over greasy cards in the vile dance

houses. As already explained, they are in the main good men; and the disturbance that they cause in a town is done from sheer rough light-heartedness. They shoot off boot-heels or tall hats occasionally, or make some obnoxious butt "dance" by shooting round his feet; but they rarely meddle in this way with men who have not themselves played the fool. A fight in the streets is almost always a duel between two men who bear each other malice; it is only in a general mêlée in a saloon that outsiders often get hurt, and then it is their own fault, for they have no business to be there. One evening at Medora a cowboy spurred his horse up the steps of a rickety "hotel" piazza into the bar-room, where he began firing at the clock, the decanters, etc., the bartender meanwhile taking one shot at him, which missed. When he had emptied his revolver he threw down a roll of bank-notes on the counter, to pay for the damage that he had done, and galloped his horse out through the door, disappearing in the darkness with loud yells to a rattling accompaniment of pistol-shots interchanged between himself and some passer-by, who apparently began firing out of pure desire to enter into the spirit of the occasion — for it was the night of the Fourth of July, and all the country round about had come into town for a spree.

All this is mere horse-play; it is the cowboy's method of "painting the town red," as an interlude in his harsh, monotonous life. Of course there are plenty of hard characters among cowboys, but no more than among lumbermen and the like; only the cowboys

are so ready with their weapons that a bully in one of their camps is apt to be a murderer instead of merely a bruiser. Often, moreover, on a long trail, or in a far-off camp, where the men are for many months alone, feuds spring up that are in the end sure to be slaked in blood. As a rule, however, cowboys who become desperadoes soon perforce drop their original business, and are no longer employed on ranches, unless in counties or territories where there is very little heed paid to the law, and where, in consequence, a cattle-owner needs a certain number of hired bravos. Until within two or three years this was the case in parts of Arizona and New Mexico, where land claims were "jumped" and cattle stolen all the while, one effect being to insure high wages to every individual who combined murderous proclivities with skill in the use of the six-shooter.

Even in much more quiet regions different outfits vary greatly as regards the character of their employees: I know one or two where the men are good ropers and riders, but a gambling, brawling, hard-drinking set, always shooting each other or strangers. Generally, in such a case, the boss is himself as objectionable as his men; he is one of those who have risen by unblushing rascality, and is always sharply watched by his neighbors, because he is sure to try to shift calves on to his own cows, to brand any blurred animal with his own mark, and perhaps to attempt the alteration of perfectly plain brands. The last operation, however, has become very risky since the organization of the cattle country and the appointment of trained brand-readers as inspectors. These inspectors examine the hide of every animal slain, sold, or driven off, and it is wonderful to see how quickly they will detect signs of a brand having been tampered with. Now there is, in consequence, very little of this kind of dishonesty; whereas formerly herds were occasionally stolen almost bodily.

Claim-jumpers are, as a rule, merely black-mailers. Sometimes they will by threats drive an ignorant foreigner from his claim, but never an old frontiersman. They delight to squat down beside ranchmen who are themselves trying to keep land to which they are not entitled, and who therefore know that their only hope is to bribe or to bully the intruder.

Cattle-thieves, for the reason given above, are not common, although there are plenty of vicious, shiftless men who will kill a cow or a steer for the meat in winter, if they get a chance.

Horse-thieves, however, are always numerous and formidable on the frontier; though in our own country they have been summarily thinned out of late years. It is the fashion to laugh at the severity with which horse-stealing is punished on the border, but the reasons are evident. Horses are the most valuable property of the frontiersman, whether cowboy, hunter, or settler, and are often absolutely essential to his well-being, and even to his life. They are always marketable, and are very easily stolen, for they carry themselves off, instead of having to be carried. Horse-stealing is thus a most tempting business, especially

THE MAGIC OF THE "DROP."

to the more reckless ruffians, and it is always followed by armed men; and they can only be kept in check by ruthless severity. Frequently they band together with the road agents (highwaymen) and other desperadoes into secret organizations, which control and terrorize a district until overthrown by force. After the civil war a great many guerrillas, notably from Arkansas and Missouri, went out to the plains, often drifting northward. They took naturally to horse-stealing and kindred pursuits. Since I have been in the northern cattle country I have known of half a dozen former members of Quantrell's gang being hanged or shot.

The professional man-killers, or "bad men," may be horse-thieves or highwaymen, but more often are neither one nor the other. Some of them, like some of the Texan cowboys, become very expert in the use of the revolver, their invariable standby; but in the open a cool man with a rifle is always an overmatch for one of them, unless at very close quarters, on account of the superiority of his weapon. Some of the "bad men" are quiet, good fellows, who have been driven into their career by accident. One of them has perhaps at some time killed a man in self-defense; he acquires some reputation, and the neighboring

FROM LIFE.

WHICH IS THE BAD MAN?

bullies get to look on him as a rival whom it would be an honor to slay; so that from that time on he must be ever on the watch, must learn to draw quick and shoot straight,—the former being even more important than the latter,—and probably has to take life after life in order to save his own.

Some of these men are brave only because of their confidence in their own skill and strength; once convince them that they are overmatched and they turn into abject cowards. Others have nerves of steel and will face any odds, or certain death itself, without flinching a hand-breadth. I was once staying in a town where a desperately plucky fight took place. A noted desperado, an Arkansas man, had become involved in a quarrel with two others of the same kind, both Irishmen and partners. For several days all three lurked about the saloon-infested streets of the roaring little board-and-canvas "city," each trying to get "the drop,"—that is, the first shot,—the other inhabitants looking forward to the fight with pleased curiosity, no one dreaming of interfering. At last one of the partners got a chance at his opponent as the latter was walking into a gambling-hell, and broke his back near the hips; yet the crippled, mortally wounded man twisted around as he fell and

shot his slayer dead. Then, knowing that he had but a few moments to live, and expecting that his other foe would run up on hearing the shooting, he dragged himself by his arms out into the street. Immediately afterwards, as he anticipated, the second partner appeared, and was killed on the spot. The victor did not live twenty minutes. As in most of these encounters, all of the men who were killed deserved their fate. In my own not very extensive experience I can recall but one man killed in these fights whose death was regretted, and he was slain by a European. Generally every one is heartily glad to hear of the death of either of the contestants, and the only regret is that the other survives.

One curious shooting scrape that took place in Medora was worthy of being chronicled by Bret Harte. It occurred in the summer of 1884, I believe, but it may have been the year following. I did not see the actual occurrence, but I saw both men immediately afterwards; and I heard the shooting, which took place in a saloon on the bank, while I was swimming my horse across the river, holding my rifle up so as not to wet it. I will not give their full names, as I am not certain what has become of them; though I was told that one had since been either put in jail or hanged, I forget which. One of them was a saloon-keeper, familiarly called Welshy. The other man, Hay, had been bickering with him for some time. One day Hay, who had been defeated in a wrestling match by one of my own boys, and was out of temper, entered the other's saloon and became very abusive. The quarrel grew more and more violent, and suddenly Welshy whipped out his revolver and blazed away at Hay. The latter staggered slightly, shook himself, stretched out his hand, and *gave back to his would-be slayer the ball*, saying, "Here, man, here 's the bullet." It had glanced along his breast-bone, gone into the body, and come out at the point of the shoulder, when, being spent, it dropped down the sleeve into his hand. Next day the local paper, which rejoiced in the title of "The Bad Lands Cowboy," chronicled the event in the usual vague way as an "unfortunate occurrence" between "two of our most esteemed fellow-citizens." The editor was a good fellow, a college graduate, and a first-class base-ball player, who always stood up stoutly against any corrupt dealing; but, like all other editors in small Western towns, he was intimate with both combatants in almost every fight.

The winter after this occurrence I was away, and on my return began asking my foreman — a particular crony of mine — about the fates of my various friends. Among others I inquired after a traveling preacher who had

come to our neighborhood — a good man, but irascible. After a moment's pause a gleam of remembrance came into my informant's eye: "Oh, the parson! Well — he beat a man over the head with an ax, and they put him in jail!" It certainly seemed a rather summary method of repressing a refractory parishioner. Another acquaintance had shared a like doom. "He started to go out of the country, but they ketched him at Bismarck and put him in jail" — apparently on general principles, for I did not hear of his having committed any specific crime. My foreman sometimes developed his own theories of propriety. I remember his objecting strenuously to a proposal to lynch a certain French-Canadian who had lived in his own cabin, back from the river, ever since the whites came into the land, but who was suspected of being a horse-thief. His chief point against the proposal was, not that the man was innocent, but that "it did n't seem anyways right to hang a man who had been so long in the country."

Sometimes we had a comic row. There was one huge man from Missouri called "The Pike," who had been the keeper of a wood-yard for steamboats on the Upper Missouri. Like most of his class, he was a hard case; and, though pleasant enough when sober, always insisted on fighting when drunk. One day, when on a spree, he announced his intention of thrashing the entire population of Medora seriatim, and began to make his promise good with great vigor and praiseworthy impartiality. He was victorious over the first two or three eminent citizens whom he encountered, and then tackled a gentleman known as "Cold Turkey Bill." Under ordinary circumstances Cold Turkey, though an able-bodied man, was no match for The Pike; but the latter was still rather drunk, and moreover was wearied by his previous combats. So Cold Turkey got him down, lay on him, choked him by the throat with one hand, and began pounding his face with a triangular rock held in the other. To the onlookers the fate of the battle seemed decided; but Cold Turkey better appreciated the endurance of his adversary, and it soon appeared that he sympathized with the traditional hunter who, having caught a wildcat, earnestly besought a comrade to help him let it go. While still pounding vigorously he raised an agonized wail: "Help me off, fellows, for the Lord's sake; he's tiring me out!" There was no resisting so plaintive an appeal, and the bystanders at once abandoned their attitude of neutrality for one of armed intervention.

I have always been treated with the utmost courtesy by all cowboys, whether on the round-up or in camp; and the few real desperadoes

that I have seen were also perfectly polite. Indeed, I never was shot at maliciously but once. This was on an occasion when I had to pass the night in a little frontier hotel where the bar-room occupied the whole lower floor, and was in consequence the place where every one, drunk or sober, had to sit. My assailant was neither a cowboy nor a *bonâ fide* "bad man," but a broad-hatted ruffian of cheap and commonplace type, who had for the moment terrorized the other men in the bar-room, these being mostly sheep-herders and small grangers. The fact that I wore glasses, together with my evident desire to avoid a fight, apparently gave him the impression—a mistaken one—that I would not resent an injury.

The first deadly affray that took place in our town, after the cattle-men came in and regular settlement began, was between a Scotchman and a Minnesota man, the latter being one of the small stockmen. Both had shooting records, and each was a man with a varied past. The Scotchman, a noted bully, was the more daring of the two, but he was much too hot-headed and overbearing to be a match for his gray-eyed, hard-featured foe. After a furious quarrel and threats of violence, the Scotchman mounted his horse, and, rifle in hand, rode to the door of the mud ranch, perched on the brink of the river-bluff, where the American lived, and was instantly shot down by the latter from behind a corner of the building.

Later on I once opened a cowboy ball with the wife of the victor in this contest, the husband himself dancing opposite. It was the lancers, and he knew all the steps far better than I did. He could have danced a minuet very well with a little practice. The scene reminded one of the ball where Bret Harte's heroine "danced down the middle with the man who shot Sandy Magee."

But though there were plenty of men present each of whom had shot his luckless Sandy Magee, yet there was no Lily of Poverty Flat. There is an old and true border saying that "the frontier is hard on women and cattle." There are some striking exceptions; but, as a rule, the grinding toil and hardship of a life passed in the wilderness, or on its outskirts, drive the beauty and bloom from a woman's face long before her youth has left her. By the time she is a mother she is sinewy and angular, with thin, compressed lips and furrowed, sallow brow. But she has a hundred qualities that atone for the grace she lacks. She is a good mother, and a hard-working housewife, always putting things to rights, washing and cooking for her stalwart spouse and offspring. She is faithful to her husband, and, like the true American that she is, exacts

faithfulness in return. Peril cannot daunt her, nor hardship and poverty appall her. Whether on the mountains in a log hut chinked with moss, in a sod or adobe hovel on the desolate prairie, or in a mere temporary camp, where the white-topped wagons have been drawn up in a protection-giving circle near some spring, she is equally at home. Clad in a dingy gown and a hideous sun-bonnet, she goes bravely about her work, resolute, silent, uncomplaining. The children grow up pretty much as fate dictates. Even when very small they seem well able to protect themselves. The wife of one of my teamsters, who lived in a small outlying camp, used to keep the youngest and most troublesome members of her family out of mischief by the simple expedient of picketing them out, each child being tied by the leg, with a long leather string, to a stake driven into the ground, so that it could neither get at another child nor at anything breakable.

The best buckskin maker that I ever met was, if not a typical frontiers-woman, at least a woman who could not have reached her full development save on the border. She made first-class hunting-shirts, leggings, and gantlets. When I knew her she was living alone in her cabin on mid-prairie, having dismissed her husband six months previously in an exceedingly summary manner. She not only possessed redoubtable qualities of head and hand, but also a nice sense of justice, even towards Indians, that is not always found on the frontier. Once, going there for a buckskin shirt, I met at her cabin three Sioux, and from their leader, named One Bull, purchased a tobacco pouch, beautifully worked with porcupine quills. She had given them some dinner, for which they had paid with a deer-hide. Falling into conversation, she mentioned that just before I came up a white man, apparently from Deadwood, had passed by, and had tried to steal the Indians' horses. The latter had been too quick for him, had run him down, and brought him back to the cabin. "I told 'em to go right on and hang him, and I would n't ever cheep about it," said my informant; "but they let him go, after taking his gun. There ain't no sense in stealing from Indians any more than from white folks, and I 'm not going to have it round my ranch, neither. There! I 'll give 'em back the deer-hide they give me for the dinner and things, anyway." I told her that I sincerely wished we could make her sheriff and Indian agent. She made the Indians—and whites, too, for that matter—behave themselves and walk the straightest kind of line, not tolerating the least symptom of rebellion, but she had a strong natural sense of justice.

The cowboy balls spoken of above are always great events in the small towns where they take place. Being usually given when the round-up passes near, everybody round about comes in for them. They are almost always conducted with great decorum; no unseemly conduct would be tolerated. There is usually some master of the ceremonies, chosen with due regard to brawn as well as brain. He calls off the figures of the square dances so that even the inexperienced may get through them, and incidentally preserves order. Sometimes we are allowed to wear our revolvers, and sometimes not. The nature of the band, of course, depends upon the size of the place. I remember one ball that came near being a failure because our half-breed fiddler "went and got himself shot," as the indignant master of the ceremonies phrased it.

But all these things are merely incidents in the cowboy's life. It is utterly unfair to judge the whole class by what a few individuals do in the course of two or three days spent in town, instead of by the long months of weary, honest toil common to all alike. To appre-

ciate properly his fine, manly qualities, the wild rough-rider of the plains should be seen in his own home. There he passes his days; there he does his life-work; there, when he meets death, he faces it as he has faced many other evils, with quiet, uncomplaining fortitude. Brave, hospitable, hardy, and adventurous, he is the grim pioneer of our race; he prepares the way for the civilization from before whose face he must himself disappear. Hard and dangerous though his existence is, it has yet a wild attraction that strongly draws to it his bold, free spirit. He lives in the lonely lands where mighty rivers twist in long reaches between the barren bluffs; where the prairies stretch out into billowy plains of waving grass, girt only by the blue horizon — plains across whose endless breadth he can steer his course for days and weeks and see neither man to speak to nor hill to break the level; where the glory and the burning splendor of the sunsets kindle the blue vault of heaven and the level brown earth till they merge together in an ocean of flaming fire.

Theodore Roosevelt.

A STRIKE.

OU are not going up to the mill this morning, George?" asked Mrs. Duncan, as her husband's light wagon was brought to the door.

"Yes; I shall be back by the time you get home from church."

The young wife looked anxiously at her husband and set down the child who had been romping in her arms.

"Is there anything new?" she said earnestly.

"Yes; the committee are going to wait on me this morning, to investigate the books and see if the company was justified in refusing to raise the finishers' wages."

"And you are going to meet them?"

"Oh, yes. Don't worry; there won't be any trouble. 'Bye, Tippie; 'bye, mamma."

Duncan kissed his wife and child, sprang into the wagon, and, after carefully lighting his pipe, drove down the avenue and out on to the river road, in the direction of the mill.

Mary Duncan's bonny face lacked its wonted smile that morning, and the choir noticed that the hands which struck the organ

keys were not quite so steady as usual. The voluntary, which accompanied the collection, was played in a minor key. Mrs. Duncan was undeniably anxious about matters at the mill, and she gave scant heed to the excellent sermon preached by the young divine, still in the first enthusiastic phase of his clerical career.

George Duncan reached the mill before the committee arrived. He unlocked the door of his office and sat down at his desk. He glanced at the clock — ten minutes to spare. He wrote a business letter, straightened a file of bills, and then for lack of a better occupation set to sketching the view of the mill commanded by the window near his desk. The tall chimney, the long rag-room, the new shed, the yard where a few plucky flowers were trying to force their way through the hard, sandy soil, the straggling cypress-trees, were all clearly outlined by a bold, free hand. Just then a figure was seen coming round the corner of the rag-room. Duncan glanced at the man and went on with his work. Two more men appeared on the scene, and a minute later the labor committee entered the office of the superintendent of the mills.

"Morning, Mr. Duncan," said the foremost

man, an ex-employee of the company who had been discharged for disorderly conduct three months before the opening of our story.

"Good-morning, Hennessey; good-morning, men," said Duncan, nodding pleasantly to the two committee-men, known to him by sight only. One was an apothecary's clerk, the other a railroad employee.

"I understand that you have come to look over my books," said Duncan, coming directly to the point. "Which of you knows something about accounts? It's hardly in your line, Hennessey, I suppose."

It appeared that Ethan Nichols, the apothecary's clerk, had been empowered by the committee to act in the capacity of examiner, and in five minutes he and the superintendent were deep in the affairs of the company. The examination was a longer matter than the members of the committee had anticipated. For some occult reason Mr. Duncan insisted that Nichols should go over the accounts for the last three years; the committee would have been quite satisfied with examining the books kept during the past twelvemonth. The morning passed very slowly with Hennessey and the railroad man, and to while away the time the two sauntered down to the river bank, and finally into the silent mill, shut down two days before by the order of the labor committee. Hennessey explained the use of the silent machinery to his colleague.

"There's a power o' money in this here mill; machinery alone must be wuth a good many thous'," said the railroad man meditatively.

"Deed you are right," answered Hennessey. "Duncan don't spare money on any new-fangled bit of machinery he happens to fancy. Why, he put a patent blower-ventilator in the rag-room last month, that was n't needed, at the cost of ten thousand dollars; and when we ask him to raise some of his men's wages twenty-five cents, he won't hear to it. But I guess he will have to come to our terms, if he wants to see his patent ventilators working again."

The railroad man laughed, and the two colleagues were in high spirits when they returned to the office, where they found George Duncan and Ethan Nichols talking together very seriously.

"Got through yet?" asked Hennessey.

"Yes," said Nichols, shaking his head; "I have got hold of all we want to know." There was a moment's pause.

"Shall I tell these men what you have learned from the company's books, Nichols, or will you?" said Duncan.

"I'd ruther you spoke to 'em, sir," Nichols answered.

"The fact of the matter is," said Duncan, speaking in the slow, good-natured way which Hennessey knew covered an inflexible will, "that the company having refused to raise the finishers' wages, the men and the girls have all struck work. In doing this they have discharged themselves from our employ, and they have nothing more to do with our concerns now than"—the superintendent paused for an appropriate simile—"than that child out there. Did we choose to make up a new crew at our old wages, it is likely that we could do so. We have never found any difficulty in getting as many hands as we could employ, but for certain reasons we have decided not to reopen the mills on the old basis. If we had intended to continue running on our old terms, I should not have agreed to meet your committee to-day. We have always managed our own concerns ourselves, and purpose to continue doing so, but we are willing that our old hands should understand the state of the case. Mr. Nichols has just learned, what we have been aware of for some time past, that the company has been losing money steadily for three years. Paper brings four cents a pound to-day. It used to bring twenty-five. A dollar is worth now what five dollars was worth then. Have the wages dropped in proportion to the price of paper? You know how that is, Hennessey. When you were discharged three months ago you were drawing the same wages you drew in war times. We have talked over closing the mills a dozen times. The matter came up this winter in the January meeting of the directors. The majority were in favor of shutting down these mills and filling all our contracts at the Framingham works, which have always paid well enough to enable us to carry the losses of this concern. Business prospects being worse instead of better, they thought it best to shut down these works. It seemed to me a pretty rough thing on the men and women to turn them out of work in the middle of the winter, and I said so to the directors, fair and square. They finally agreed to run the mills till midsummer, and then, if the prospects were not brighter, to close up here, unless we could make better terms with the mill crew. You have settled the question for us. Under the direction of the labor committee our men and girls have all struck, or, as I said before, discharged themselves, the committee having agreed to support them and their families until we should be coerced into raising the finishers' wages. I hope the committee will keep their word, for we have decided not to reopen the works, unless we can do so with reduced pay, from the superintendent down to the lumpers."

As Mr. Duncan finished this, for him, re-

markably long speech, he put together his papers, locked his desk, and, reaching for his hat, jingled the keys of the office in his hand. The members of the committee exchanged significant glances.

"It's a lie!" whispered Hennessey, as the superintendent stooped to unchain his setter, fastened to a ring below the desk.

Nichols shook his head gravely, and the railroad man looked from one to the other dubiously. Duncan turned on them sharply, with a distinct change of manner.

"How's that, Hennessey? Nichols, be good enough to inform these men if what I have said about our affairs agrees with the accounts."

"Yes," responded the apothecary's clerk reluctantly; "it does."

Hennessey muttered something between his teeth, the words "cooked accounts" alone reaching the superintendent's ear. The young man, gravely balancing a heavy whip that had stood in the corner, said coolly:

"That is all I have to say to the labor committee; but if I find any loafers hanging about these works five minutes from now, I shall have something very different to say to them."

Hennessey was already in the yard, and by the time George Duncan had locked the office door the trio had disappeared.

On Monday morning the town of Riverside presented a holiday appearance. The main street was full of working-people in their best attire. Groups of over-dressed girls surrounded the shop windows, eying the finery they could so ill afford to buy. The mill was deserted, but the rival liquor saloons were doing a brisk business. George Duncan was seen driving out of town early in the morning, with his fishing-rod and basket. He was a skillful angler, and devoted these days of enforced idleness to the pursuit of the piscatorial art. Mary Duncan took the opportunity of her husband's absence to begin her house-cleaning. Her own competent servants, for some unexplained reason, were relieved from their usual share in the labor, and two helpers made their appearance at the back door shortly after the master's departure. Each of the helpers was accompanied by a baby, which she carried on the right arm, and a basket, which hung from the left. The baskets were empty when they came, but at nightfall their owners carried them away (before Duncan's return) in an exceedingly replenished condition. Mrs. Duncan minded the two children most of the day, to the jealous rage of Tippie, a born aristocrat, who would have nothing to say to the extraneous babies. Such a scrupulous scrubbing as the little house got that week it prob-

ably never had had before, and its master devoutly hoped that it might never again endure. George Duncan, albeit perfectly aware of all that was going on in the seclusion of his home, never in the most distant manner referred to it, although the combined odors of brown soap, camphor, benzine, and ammonia, together with the sprinkling of tacks on the carpetless floor, gave him a realizing sense that the house was being, as he might have expressed it, "turned out of windows."

So matters stood for a week. The mills were silent and deserted; but each day the main street seemed to grow fuller of idle rowdies and over-dressed girls. The superintendent had received, and returned unopened, several communications from the labor committee. The week drew to a close. It came to be known to the town that there had been differences of opinion between the striking mill crew and the members of the labor committee. The matter was laid before the central or state committee of the league, and a new local committee was appointed for Riverside, with the same salary (three dollars per diem) as their predecessors. When this was known, Hennessey's credit at the chief shop and at both the saloons came to as sudden an end as his authority. One of the refractory finishers, the father of eight children, was overheard to remark to a friend that if Hennessey had not been drinking like a fish he might have made a good thing out of the affair.

The thrifty Ethan Nichols, we will say in advance of the fact, soon after bought out the old apothecary in whose employ he had learned all he knew, at terms very advantageous to the purchaser. The business, which had suffered an unaccountable decline in favor of the druggist at the lower corner, revived as suddenly as it had drooped, and the good old man who had built up the connection, beggared by the invisible boycott, now tied up packages and served as clerk in the old shop that he had owned for thirty years. The wife of the railroad employee was resplendent, the following winter, in a sealskin dolman handsomer than Mary Duncan's had been, even when it was new. But we anticipate.

The next Sunday but one found Mr. Duncan a good deal browner and his wife a shade paler than on the morning when we first saw them. Duncan had been fishing almost every day, and had had wonderful luck; his wife had staid at home, and had been unusually busy in cutting out enough little frocks and pinafores to have clothed Tippie for ten years to come. The stitching of these she intrusted to various women of her acquaintance: it was very badly done, as a rule, and in strange contrast to the neat sewing which her own machine usually

turned out. Husband and wife were sitting together in the porch, looking out over the river, while the church-bells rang their sonorous invitation to evening worship. The line of floating yellow sawdust on the river indicated that the tide had turned, and the log-raft was making good progress downstream. Two large vessels anchored near the shore still bore the heavy cargoes which they had brought in four days ago. Orders had been given by the labor committee that they should not be unloaded—their owner was under a boycott. Mary Duncan broke the silence which had fallen between herself and her husband.

"And so you knew about Mrs. Hennessey and Martha Needles all the time?"

"And the horrible garments which I was expected to believe that Tippie was in such need of that you had to put the work out? Of course I did."

"Then why did n't you scold me for aiding and abetting the strikers? Goose!"

"What was the use? If it had n't been one way it would have been another. On the whole, I thought it was better that they should make some return for the bread I was sure you would put into their mouths. Can you keep a secret?"

Mrs. Duncan knit her pretty brows and replied that if he did not know by this time that she could, it was quite useless to inform him on the point.

"Of course you can. But don't tell Myrtle; I'm not so sure about her."

"If you are not sure about Myrtle you had better not speak so loud," a voice cried from an upper window; and a young girl with eyes like cool agates and a mop of yellow-brown hair appeared for a moment at the opening, and then shut the window down with a bang.

"There, you have hurt her feelings," said Mrs. Duncan. "I don't know why you always suspect women of not being able to hold their tongues."

"Because they can't," George briefly replied. "She will forgive me. We are going to start up the mill to-morrow morning."

"George!"

"Yes. We gave our old men two weeks to come to our terms, and warned them that after that time there would be no vacancies. Yesterday a crew large enough to start the works arrived here from Framingham. They are picked men, all non-unionists, and to-morrow morning the old whistle, which has been silent for the only time since my grandfather first sounded it in 1825, will call the new hands to work. They know their business. They were thrown out of employment by the burning of a mill just below ours at Framingham.

Of course nobody knows anything about the firing of the mill, and it has been suggested that a police officer committed arson in order to throw suspicion on the union."

"You don't think *they* are wicked enough to do that?"

"As an association, no; as individuals, yes."

There was a long pause. Mary Duncan slipped her hand into her husband's. "That was why you sent for Myrtle—you thought there might be trouble."

"There always *may* be trouble," said Duncan, "but I do not anticipate any disturbance. I don't believe that one of the men who have struck would raise his hand against my life or property. They are fools, that is all."

"Poor misguided creatures," sighed Mrs. Duncan. "Did you know that Hunton had telegraphed to stop his lumber? He does not mean to open the saw-mills this season."

"Yes; one hundred thousand dollars' worth of logs are lying up-river, and not a stick of them will be sawed before next summer."

"That means two hundred men out of employment, and their women and children in want."

"That means, my dear, that we shall have to support them. There is the strong point of these fellows. They know that in no civilized community (outside of the largest cities) of the United States are people allowed to starve or freeze; so whether they work or not, the capitalists have got to support them, directly or indirectly."

"And you really start the mill to-morrow morning?"

"Yes; but the secret must be kept. I think, with the exception of ourselves and the new crew, that not a soul in town knows it. I shall drive up later to let the water on and get up steam. The first thing that the town will know of it will be when the whistle sounds at 6 o'clock to-morrow morning. You are not to sit up. Mind, I shall be very angry if you do not go to bed at half-past 10. You are losing your color with all these worries of ours."

Twelve o'clock found Mrs. Duncan reading by the sitting-room fire, in direct disobedience of her husband's commands. Myrtle was sleeping peacefully on the sofa, with the good dog Sport lying beside her. By way of choosing something cheerful in the literary line, Mrs. Duncan was reading one of O'Brien's blood-curdling tales. No wonder that when the quiet of the night was broken by a light tap on the window she sprang to her feet and shrank into a remote recess behind the fire-place.

Myrtle slept on peacefully, and Sport waked

enough to give a sleepy growl, relapsing the next moment into a profound repose.

Mrs. Duncan spitefully threw the offending book on the table, murmuring:

"I might have known that horrid story would make me hear and see ghosts."

There came another tap, this time loud enough to wake the sleepers. Myrtle sat up, yawned, shook her loosened hair from her face, and asked sleepily:

"What did you say?"

Mary Duncan from her corner pointed significantly to the window and said, "*Hush, hush!*" twice as loud as the girl had spoken. In a moment Myrtle was wide awake, and Sport sat up on his haunches, wagging his tail expectantly. The knock was repeated impatiently. Myrtle boldly drew back the heavy curtain, and then with a loud scream sprang behind Mary, burying her face in her friend's shoulder.

"What was it?" whispered Mary.

"Such an awful face!" gasped Myrtle. At that moment a slight noise fell on Mary's ear: it was only the creaking of Tippie's crib in the nursery above, but the sound steeled the mother's heart, and, bold as a lioness, she walked to the window and looked squarely into the face pressed close to the pane. Then she laughed a little hysterically, and with a scornful glance at her companion, and with the exclamation, "You silly thing!" quietly proceeded to open the window.

"You gave us such a start, Mrs. Hennessey: my cousin and I are all alone. Is there anything the matter?"

Mrs. Hennessey's brown, wrinkled face, devoid of teeth and ornamented with a huge pair of shaggy gray eyebrows, sufficiently suggested a witch to account for Myrtle's agitation. Her answer was not intelligible to the girl.

"Wait a moment till I open the front door," said Mary, taking the lamp with her, and leaving the room in darkness. She did not return, but showed her visitor into the study.

"Now, tell me what you have come for, quickly," she said, laying her firm hand on the old woman's shoulder.

"Where's the boss?"

"He is busy and can't possibly see you."

"Aye, but where is he?" persisted the woman. "I tell you I must see him this very night."

"He is not here," admitted the wife reluctantly.

"But where, woman? God 'a' mercy! he has never gone to the mill?"

"Yes; why do you ask?"

They looked in each other's terrified faces for a moment; then the elder woman said in a sharp voice:

"Then there's mischief done, likely. My man went up to the works with something of the like of gunpowder to blow up the big water-wheel, and likely they'll meet one another."

"My husband went up an hour ago to get up steam and let the water on," whispered Mary.

"Whatever will we do, marm?" wailed the workman's wife.

"What shall we do?" echoed the wife of the superintendent.

"Do?" cried Myrtle, from the doorway, "why, come help me harness Dick, of course."

The tall roan submitted, as only a creature of his intelligence could have done, to the strange disposition of his harness, buckled on by trembling, unaccustomed hands, and quietly suffered the bit which Myrtle bravely inserted between his teeth, her heart beating like a trip-hammer the while. The two women, threatened with a greater danger than the heels of the thoroughbred, did their share of the work as if the beast had been a thing without nerves or power of action.

The night was heavily dark, and outside the small disk of light thrown by the stable lantern they could see nothing. But Dick knew the way and started down the river road at a good pace. The three women, crowded together in the light wagon, gave a simultaneous cry as, at a turn of the road which ran parallel with the railroad track, the night express came tearing towards them. Myrtle felt the horse shiver, and tightened her grip on the reins, calling his name gently.

"If they don't blow the whistle I can manage him," she said between her teeth, taking a turn about her hands with the lines.

"We are just by the crossing, where they always blow it," said Mary calmly. The train was upon them. They saw the engineer raise his hand to the lever of the throttle-valve—a woman's scream pierced the rumble of the train, the man turned and, looking through the engine window, caught a glimpse of a terrified horse and the white face of a woman, and, in direct violation of the rules and regulations pasted up within two feet of his eyes, forbore to pull the whistle. With its dull roar the train sped out of sight. By the time they reached the lower falls Myrtle's aching hands relaxed their grip a little. Dick's run had sobered into a swift trot.

"That's Hutton's saw-mill," said the workman's wife, peering into the darkness. "When we pass the next turn we shall see the light in the office window, if they are there."

There was no light in the office, and they would have passed the mill, had not Dick of his own accord turned from the highroad and

stopped before the shed where he was wont to stand.

Lights were seen flitting about the long dark building. In the machinery-room Superintendent Duncan and half a dozen men were making preparations for the morning's work. Duncan had thrown off his coat, and was giving a word here and a hand there to the new men. McGregor, the Scotch foreman, was the only member of the old crew who had stood by the company through the troublous days, passed now, Duncan believed firmly. Outside, the river was frothing over the dam in a last frolic of idleness. Its holiday was at an end, and the rushing, riotous stream must go to work again at the behest of its master, man. It was singing its last merry song of play; for in a few moments the rumble of the machinery would mix itself with the river's chant, and by that sound of bondage all the world would know that it had gone to work again. The superintendent stood ready to turn on the water through the race. He made a fine picture, standing leaning on the small iron rod which swayed with the motion of his hand the whole current of the stream. He was a strong, handsome man, with a broad, tall figure, an honest, serious face with bright blue eyes and a wide, white forehead. In his expression readers of character recognized the rare combination of great sweetness and great strength. His foreman, in referring to what had happened, was saying to one of the new hands in an undertone:

"They tackled the wrong man when they ketched a holt of the boss for a strike."

Duncan's hand was on the crank, and with a light twist he set in motion the machinery that let on the water. There was joy and triumph in his heart when he heard the gasp the water gave as it first rushed into the race. The noise sounded cheerfully through the dim machinery-room, bringing a sense of great satisfaction to the superintendent and the foreman, grown weary of the silent machines.

The rush of the waters fell very differently on the ears of a man working clandestinely among the water-wheels of the great mill. He dropped his tools and stood upright, doubting his own senses. His dark face blanched to a ghastly pallor as, snatching up the lamp the rays of which lighted the low, gloomy chamber under the ground and under the water, he made his way with trembling limbs to the ladder that led up from the damp wheel-pit where he had been working. Quick as he was, the flood was quicker, rushing sullenly to its work with angry gasps and sighs. The heavy stone arches frowned down upon him: they would give him no shelter from his own infernal work.

He cursed his Maker in that hour of agony; and while yet the blasphemy was on his lips a sudden tremor shook the mill to its foundations, a deafening crash as of thunder rent the air, the roof above him was lifted from its supports, and he was hurled down into the very pit where he had placed the dynamite bomb, which the first revolution of the great wheel had exploded.

The first rays of the sun showed a desolate scene. The great mill, which the night before had stood solidly above its dam, was now nothing but a shattered ruin, its delicate machinery hopelessly wrecked, a dead loss of thousands of dollars, which made every man in the community the poorer. Men were still busily working at their dreadful task of searching the ruins for the victims of the explosion. George Duncan had been first discovered, miraculously preserved from death, by the women who had come just too late to warn him. He would live, but his strong right arm was gone, and the splendid vitality which had been a power to energize the men and women with whom he was thrown in daily contact would never again stimulate them to better and more intelligent work. His wife and Myrtle were beside him now in the office, which had escaped destruction. Martha Hennessey was working among the men with the strength of despair, searching for the man whose hand had wrought the dire disaster. They found him at last in the wheel-pit, and the rough workman who first saw the ghastly mangled body cried out to those above to "Keep the woman back, for God's sake." But she was beside him as he spoke, and after one look at what had been her husband, she sank to the ground in a deep swoon. The same wagon bore the dead man and his senseless widow to the cottage where a group of frightened children wailed a melancholy greeting to the living and the dead.

Next day the local paper printed the following notice:

We, the United Brothers of Riverside, desire to express the deep sympathy we feel for the sufferers from the terrible explosion at the Riverside Mill. We cannot find language strong enough to sufficiently condemn the fiendish conduct of the miscreant or miscreants who are responsible for this awful calamity.

For the United Brothers,

MARTIN KNOWLES, *Secretary*.

A few days after the funeral of Patrick Hennessey, Mrs. Duncan was told that a person desired to speak with her in the drawing-room on a matter of importance. She had not left her husband since the accident; and Myrtle, who had just returned from exercising Dick, was sent down to inquire concerning the stranger's business. The visitor's face was

familiar to her, but she could not remember where she had seen it before.

"Mrs. Duncan cannot leave her husband; is it a matter that I can attend to?" she asked civilly, looking with some curiosity at the stranger. He was a man of striking appearance, with a slight, elastic figure and a well-shaped head, covered with heavy dark curling hair. His features were delicately cut, and his large earnest brown eyes were as frank and clear as a child's. His clothes were common but neat, and he looked as if he deserved to be better dressed.

"I am the secretary of the new committee of the United Brothers," he began, and then suddenly paused. Myrtle's indifferent curiosity had changed to an angry intensity; her pretty mouth had grown hard and stern, three ominous bars marred the whiteness of her forehead, and her hand tightened unconsciously on the riding-whip with which she had been carelessly flicking the dust from her habit. The change was so instantaneous and threatening that the man paused, hesitated, and before he could utter another word, Myrtle interrupted him vehemently.

"Oh, you are one of those men, are you? and may I ask what you mean by showing your face inside of this house? Are you not satisfied? You have almost killed the master, and you have come now to insult the women."

"I beg your pardon, madam; I do not think that you understand me. It is to express the profound sympathy of my colleagues that I have come; to express our hopes that Mr. Duncan is in a fair way to recover."

"In order that you may complete the work your predecessors have begun so well?" laughed the girl bitterly, playing nervously with her riding-whip all the time. The young man, who had been rather pale before, flushed suddenly, the hot color mounting even to his smooth forehead. He looked steadily into Myrtle's flashing eyes, until an answering color crept into her cheeks, and after viciously flicking off the petals of a flower standing near her, she bent her whip between her fingers till it almost broke.

"Well," she said sharply, when the silence had become a little embarrassing, "is there anything else?"

"I will not detain you longer, Miss Gray; perhaps I shall be able to see Mr. Duncan himself, or his wife, in the course of the next few days?" this interrogatively.

"No," said Myrtle decisively. "Mr. and Mrs. Duncan are going to Europe as soon as he is able to bear the journey. This house will be offered for sale, and I suppose you have heard that the company have as good as decided not to rebuild the works."

"Not to rebuild! Are you sure of that?" he asked eagerly.

"Quite sure; are you surprised? Who ever expected they would?"

"I did; I still think they will." Myrtle opened her cool eyes to their fullest extent, and laughed again, scornfully still, but not so cruelly as she had laughed before.

"Why?" she asked, interested in spite of herself.

"Because it is for their interests as well as for ours. This terrible calamity affects us as much as it does them. Are we to be held responsible because a low ruffian betrays our cause and commits a crime for which we are all obliged to suffer?"

The girl shrugged her shoulders with a gesture of indifference; but her face was not indifferent — she was listening. That was enough for the enthusiast.

"Do you not see how greatly both sides have been at fault, and all from a lack of a proper understanding between them? We should have been told three years ago the true condition of the affairs of the mill. It is our right. All we have in the world is embarked in this project; your mill is the capital, but what good is the mill without the men? It was like trying to divorce the Siamese twins of capital and labor: it meant death to both. We should have been told that the company was losing money; we should have devised together how matters could be mended, what concessions could be made, what reduction of wages. Instead of that we have been deceived, and what has the deceit led to? Famine, misery, and death."

"It would not have been possible to publish the condition of the affairs of the mill; it would have led to bankruptcy."

"Not if you had trusted us, not if you had made us the partners of your profits, not if you had treated us like men and women who have a right to an interest in the fruits of their labor, instead of like senseless machines whose work, whether good or ill, was to be paid for like so much coal or paper stock."

"But it is just that: your labor is the fuel, the power, like steam or water."

"No, for steam and water are only tools; but no man has the right to degrade another man to the level of a machine. See the results of this course. Our men were allowed to believe that these mills were making a great profit in which they had no share; they asked for what they supposed to be their rights, and learned for the first time the true facts of the case. They should have known them long ago."

He was speaking earnestly, with the ease and grace and security of youth and hope.

His enthusiasm was not without its effect upon the tall girl, whose lips had lost their scornful curl, and who now listened with a certain incredulous tolerance.

"In a word, you believe in coöperation," she said, speaking less satirically than she had done heretofore.

"Yes; it is the answer to the riddle of our nineteenth century Sphinx."

Myrtle stared a moment in silence at her visitor. His good use of English had already surprised her, but this allusion to the guardian of the Egyptian desert was all that was needed to arouse her suspicions of this handsome youth with the firm white hands, who claimed to be a working-man and looked like a gentleman. At this moment there was a stir in the room above, and a message came from upstairs; Duncan wished to know the name and business of the visitor.

"Please say," said the young man, looking earnestly at Myrtle, "that I am the man who was to have been Mr. Duncan's assistant, and that I am very anxious to speak to the superintendent, if he is able to see me."

Myrtle repeated the message to the servant and walked to the window, out of which she stood looking towards the river, with its yellow line of floating sawdust.

"Your father is still president of the company, and owns the controlling stock, I believe, Miss Gray?" said the young man.

"Yes."

"And you yourself have some interest in the concern?" She nodded an assent.

"Look across the river, see those tidy little houses with their pretty gardens; those belong to the mill property. You know every man, woman, and child who lives there. The town has grown up round the mill. Take the mill away and what will happen? Ten years from now you will see those neat little gardens waste places, those houses desolate ruins, and all because you Grays and Duncans are so proud. I was born in one of those houses; I went to school in that school-house your father built for us; I have been to church all my life in the chapel old Mr. Duncan endowed; all the books I ever read till I left home I got out of the library those two men gave to the town, to their operatives. I have been away now four years, getting my education—George Duncan gave me that. I was to be his assistant; I came home the very day after the accident—"

He paused. Myrtle turned from the window, her frank face wearing for the first time during the interview its usual sweet expression: she was interested in what he was saying; she was waiting for him to go on.

"Shall I tell you what I would do if I were in your father's place, Miss Gray? I

would rebuild the works at the smallest possible cost. I would agree with my hands to pay them whatever wages I could afford. At the end of a year I would divide the earnings after this fashion: the principal, or capital with which the mill was built, has a right to earn its five per cent.—that belongs to the owners; then I should put aside a certain sum for expenses of repairing and improving the machinery and so forth, after all costs had been paid, and as a reserve fund for bad years. After that I would take the surplus profits and divide them into halves; one for the men who furnish the capital, one for the men who give the labor."

The girl smiled, but it was a kind, womanly smile, with nothing of the bitter lurking behind the sweet.

"Perhaps if you live a thousand years you will be able to put your scheme into practice—when the millennium comes," she said.

"I believe that I shall live to see it, and die at three score and ten."

Myrtle laughed outright.

At that moment the servant returned, bringing word that the young man was to come up to Mr. Duncan's room. He turned to follow the woman, but paused for a moment at the door, saying, in a low, hurried voice:

"You are a stockholder; your father is the president of the mills. I am sure that you have a great deal of influence with him. Will you not use that influence to help our cause?"

"But I cannot. I do not think you are right; your plans are those of a visionary—"

"Would it be right to ruin the town which you have built up, because a snake has crept into the village and stung you?"

"I am not sure."

"Yes, you are. Do you not want to see the children you have known all their lives grow up in the place where they belong; do you not want to see Riverside, the spot where you were born, a prosperous, growing town, instead of a deserted village?" He had come quite close to her as he spoke. There was a pause before Myrtle answered slowly:

"Yes."

"Then help me to rebuild the works."

His audacity had something sublime about it. He believed in his principles, in himself, so thoroughly; he was withal so handsome in his enthusiasm, standing before her with his head thrown back, his eyes shining, his face eager and flushed with the force which beat in his veins and which he felt sure must conquer the obstacles that stood between him and his ideal, that it was not perhaps surprising, all things considered, that Myrtle's cool agate eyes took fire from his flashing ones, and that she said impulsively:

"I will try."

When the young man entered the sick-room, with the triumph of that first victory speaking in his light, quick tread, in his glowing, self-reliant face, he stopped short at the threshold. There lay his benefactor, his friend, crippled for life, pale as the linen of his bed, and beside him stood Mary Duncan, whose chestnut hair in the agony of those long hours of suspense had lost its brightness forever, and was now thickly powdered with gray. Duncan smiled and held out his left hand, saying feebly but cheerfully:

"Welcome home, my boy."

The visitor took the hand, pressed it a moment between both his own, and then walked quickly to the window, turning his back upon a scene which had well-nigh unmanned him.

"You see before you, my friend, one of the results of the theories your letters have been so full of. They usually do the thing more neatly in Russia, I believe. This was a bungling job after all; the only thing they have killed is the goose that lays the golden eggs."

"Don't say that, Mr. Duncan. You don't mean it, sir; I know you don't, even in this dreadful time. I am proud to remember that

you used to say that I should grow to be your right-hand man, and I had come to offer myself to you in any capacity—let me change that pillow for you."

As he spoke he lifted the wounded man's head to an easier attitude.

"Yes; you shall stay and help nurse me. The women are quite worn out with watching; and when I am a little better I will listen to your theories, and you shall help me with my plans."

"Your plans?"

"Yes, of course. My wife thinks she is going to carry me off to Europe and make an invalid of me for the rest of my days; Mr. Gray thinks he is going to sell the mill property at auction; but they can't hold a meeting until I am well enough to be present, and from the first I have been determined to rebuild the works."

"Then the goose is n't killed after all?"

"No, only hobbled!"

"You must not talk any more, George," cautioned Mary Duncan from the doorway; and in five minutes the patient was asleep, and quiet reigned in the sick-room.

Maud Howe.

THE NEW POLITICAL GENERATION.

THE close of the first century of the Republic finds a new political generation assuming control of its destinies. The average life-time of a generation of human beings has long been held to be about thirty-three years, and the theory will be found also to hold good of public men as a class. Exceptions of course occur, when unusual longevity prolongs the career of one man far beyond that of his early associates; but such exceptions only prove the rule that, as a whole, the governing body changes three times in a hundred years.

The first generation under the Federal system held the stage during the period from 1789 to 1825, and may be called the constructive generation. The Revolution had been carried through by young men. Jefferson was but thirty-three years old when he wrote the Declaration of Independence, and the patriot army numbered many an officer like Monroe and Hamilton who joined it at eighteen or nineteen. The constitutional convention of 1787 contained a number of the men who had become prominent either in the field or in the council chamber during the war, and

who yet were comparatively youthful. It thus came about that the men who organized the new government in 1789, although a large proportion of them had already been prominent in affairs for a good while, were still for the most part in the prime of life. Washington, then fifty-seven, was the senior member of his administration; Jefferson, the first Secretary of State, forty-six; Knox, Secretary of War, thirty-nine; Randolph, attorney-general, thirty-six; and Hamilton, Secretary of the Treasury, only thirty-two. John Jay, first Chief-Justice, was not yet forty-four. Madison took his seat in the first House of Representatives at thirty-eight, and Monroe appeared the next year in the Senate before he was thirty-three.

It was in every way most fortunate for the young nation that its first rulers were young men, who were yet old enough to have shared in the long struggle which was necessary for its establishment. The Federal Government was an experiment; the Constitution was a novelty; the proposed division of powers between different departments of a central government, and between the central government and its constituent States, was without precedent. Questions immediately arose as to the interpretation of the fundamental law, which

must be decisively settled. Happily the very men who had helped either to frame the Constitution or to secure its adoption by the States were in Congress, on the bench, members of the cabinet, in the presidency; and so it long continued. Monroe entered the army only a year after the battle of Lexington; it was fifty years after the battle of Lexington when he retired from the presidency, and up to that day every incumbent of the highest office had been, like him, honorably associated with the Revolutionary era. Indeed, Monroe was not the last representative of that era. Marshall, the great Chief-Justice of our history, though nearly three years Monroe's senior, expounded the Constitution with unsurpassed ability for more than a third of a century, until his death in 1835, when nearing eighty.

It would be impossible to exaggerate the beneficent effect upon our development of the fact that this constructive generation represented in itself, and so perpetuated, the patriotic impulses of the Revolution. The Constitution had been grudgingly accepted by several of the States; the centrifugal forces which had manifested themselves during the period of the Confederation were still active. The Federal Government was distrusted by a large proportion of the population; sectional jealousies were rampant. A strong cohesive influence was needed to weld together the discordant elements, and it was furnished by the generation of public men who had endured so much in order to found a nation that they were bound to save it from early wreck.

As death thinned the ranks of the Revolutionary statesmen, there came to the front our second political generation,—the compromise generation,—which ruled the nation from about 1820 until the election of Lincoln. This was the age of Clay and Webster; of Jackson and Calhoun; of Benton and Taney; of the Missouri compromise and its repeal; of the fugitive-slave law and the Dred Scott decision. It was a generation which for the most part was born during the Revolution, and contained some men whose boyish memories covered incidents of that struggle, like Jackson's capture by a band of English troops in North Carolina when he was thirteen years old, in 1780, and the raid of English cavalry past Henry Clay's home in Virginia the next year, when he was four. Webster and Calhoun were born within two months of each other early in 1782, and appeared in Congress within two years of each other during the period which covered the second war with England, the South Carolinian in 1811 and the New Hampshire man (as Webster then was) in 1813. Clay had preceded them, hav-

ing entered the Senate late in 1806, more than three months before he had reached the constitutional age of thirty. Benton, who had been born four days before Calhoun, began his thirty years of continuous service in the Senate in 1821. The period which made four such men for a long while associates in the United States Senate must always remain a memorable one in our annals.

The Revolutionary generation lived to see the new government in good running order, and the wisdom of their constructive work vindicated. The delicate machinery had apparently been well adjusted, and men who had disagreed so radically on some points as John Adams and Thomas Jefferson came in their last years to be satisfied with the settlement which had been reached and hopeful as to the future. Yet there were already visible in their day signs of the impending trouble over the slavery question which confronted their successors. The difficulties of conducting a government in a nation half of which was slave and half free became constantly more obvious, but they were not yet admitted to be insuperable. It was still thought by most people that some arrangement might be made which would be satisfactory to both sections, and the constant effort was to discover a *modus vivendi*. One scheme and then another was tried, each in turn held by its authors to be the final settlement which was to end the trouble. Looking back now, it is easy to see how hopeless were all these attempts; but it is also easy to see how fortunate it was that the generation of compromisers held sway so long. They averted the inevitable struggle at a time when its issue would have been doubtful, and postponed the inevitable war until the disparity of the contestants should insure the triumph of nationality and freedom. "Let us make our generation," said Webster in his famous 7th of March speech, "one of the strongest and brightest links in that golden chain which is destined, I fondly believe, to grapple the people of all the States to this Constitution for ages to come." The wish was granted, for without that development of love for the Union which Webster sedulously cultivated, while Clay, "the great pacificator," preserved the peace, the two sections must have fallen apart.

Clay and Webster, the great compromisers, died within four months of each other in 1852. Feeble efforts in the same line with theirs were continued for a few years longer by surviving associates like Bell, Crittenden, and Everett. But even before the disappearance of Clay and Webster there had begun to rise the third generation of our national history—the generation which was to prove the recon-

structive one. It was composed of men born during the first twenty years of the nineteenth century, and it made its appearance in Washington when John P. Hale, the first senator elected as an anti-slavery man, took his seat in 1847, followed by Seward and Chase in 1849 and by Sumner in 1851. They met there men like Davis and Toombs, who represented ideas diametrically opposed to their own and who were determined that those ideas should prevail — peaceably, inside the Union, if possible; by secession and force, if necessary. The new men from the North saw that the old rôle of Webster could no longer be played. Webster had perceived that there was a conflict, but hoped that it might be repressed; Seward comprehended and proclaimed that it was “irrepressible.” A year before his death Webster had said, “If a house be divided against itself, it will fall and crush everybody in it”; but he argued in the same speech that there was no real division and consequently need be no fall, even though slavery were to be permanent in half of the national domain. Six years after Webster’s death, Lincoln, in opening his famous canvass of 1858 against Douglas, also quoted the saying, “A house divided against itself cannot stand,” but he gave it a very different application. “I do not expect the Union to be dissolved — I do not expect the house to fall,” said Lincoln; “but I do expect it will cease to be divided. It will become all one thing, or all the other.”

The election of 1860 and the outbreak of the civil war pushed aside the survivors of the last century, and put the control of affairs, both North and South, with only an occasional exception, in the hands of men born since 1800. Lincoln, born in 1809, was at the head of the Federal Government; Davis, born in 1808, the chief of the Confederacy. The command of the Union army, which was held at the outbreak of hostilities by Scott, who had been born in 1786, fell to Grant, born in 1822, who was supported by Sherman, born in 1820; while his great opponent was Lee, born in 1807, whose lieutenant, Joseph E. Johnston, was born in the same year. Seward was born in 1801, Chase in 1808, Sumner in 1811, and Stanton in 1814.

It was men of the same age who held sway in Congress during the period after the war in which “the States lately in rebellion” were restored to their relations with the Union. Benjamin F. Wade, the leader of the majority in the Senate during the Johnson administration, was born in 1800; Thaddeus Stevens, his counterpart in the House of Representatives, dated back to 1792. The Supreme Court, as Lincoln found it, had a Chief-Justice born in 1777 and four of the five associate justices

had been born between the latter year and 1794. Lincoln’s Chief-Justice was born in 1808 and Grant’s in 1816, while the associate justices appointed by these presidents were men born between 1804 and 1816.

Thirty-seven years have passed since Sumner, the most conspicuous senatorial representative of the reconstructive generation, appeared in Washington, and not one man whom he then found in office now remains in public life. Only a few names, like those of Jefferson Davis and Hannibal Hamlin, have escaped the mortuary star. His great associates in the Senate chamber before the war, Seward and Chase, died within the eighteen months before his own death in 1874. Stevens had preceded him by six years; Wade was already in retirement. Of all the men who were in Congress at the time of Lincoln’s election, John Sherman, then a representative and now a senator, and L. Q. C. Lamar, then a representative and now a justice of the Supreme Court, are the only ones who are to-day conspicuous. Three of Lincoln’s five appointees to the Supreme Court are dead; the other two are seventy-two years old, and may retire on a pension at their pleasure. Two of Grant’s four appointees to the same bench are dead; a third retired on a pension eight years ago, and the fourth has been eligible to a pension for five years. Allen G. Thurman, who was elected congressman nearly forty-five years ago, seems a relic of a by-gone age.

As the third generation of our public men dwindles in size, the fourth comes in steadily swelling numbers to fill the vacant places. It is a generation which has grown up since the period when secession and state sovereignty were burning issues — which in large part is too young to have had any record on the slavery question. There are many men in Congress who were too young to vote in the election of 1860; some who had not then reached their teens. The State of West Virginia has two senators and four representatives, and the oldest of the six was born as recently as 1843. Four of them served in one or other army during the war, but this incident in their lives hardly dissociates them from the two who did not, one of the latter being but eight years old when Sumter was fired upon. Younger still is a Minnesota representative, who was not born until 1854, and whose case, by the way, well illustrates the cosmopolitan character of our population, as he is a native of Sweden and did not reach Minnesota until 1868. Another illustration of the same feature is the case of the New Jersey congressman who was born in Ireland in 1853, and a third the Wisconsin member who was born in Prussia in 1845 and did not come to this country

until 1866. An Indiana member has but recently completed his thirty-first year.

Nor do such facts as these fully show the extent to which the new generation has supplanted the one which brought on secession and carried through the war. The Constitution does not permit a man to become a senator until he has attained the age of thirty, or a representative until he has completed his twenty-fifth year. It seldom happens that a man becomes a senator until he is considerably past thirty, or a representative until he is much beyond twenty-five. But the ten years from twenty-one on are years which mark the age of a much larger proportion of voters than anybody who has not investigated the matter would suspect. A table of the ages of native white males, as returned in the last national census, shows that out of a total in the whole country of 8,270,518 who had reached the voting age, no less than 1,546,703, or nearly one-fifth of the whole number, were 21, 22, 23, and 24 years old. Add those who were between the ages of 24 and 30, and the aggregate is 3,019,663, or much more than one-third of all. Another census would show different totals, but the proportions would be the same. This means that nearly one-fifth of the voters are too young to be eligible to the House of Representatives, while much more than one-third are not old enough to be chosen to the Senate. Nearly all of this latter class, it must be remembered, are men who have been born since the outbreak of the war, for the baby born the day Sumter was attacked is now a man in his twenty-eighth year. Indeed, there are far more than a million of men entitled to vote for President this year who were not born until after Lee's surrender. On the other hand, those who were old enough to vote in 1860 are at least 49 years of age this autumn, and less than a quarter of all male adults (1,958,776 out of 8,270,518 in 1880) are men who have passed 48.

It is thus clear that the new generation is already here. The men who heard the Dred Scott decision, who went to the polls for Lincoln or Douglas, constitute but a small minority of the electorate to-day. They still linger in the halls of Congress, but they find the seats fast filling with those whom they have always considered mere boys, until it is suddenly revealed to them that they are no longer the real rulers of the republic. The old issues disappear with the old men, and

New things succeed as former things grow old.

The death of Chief-Justice Waite served to show how completely the reconstructive generation to which he belonged has done its work. The Supreme Court is the final arbiter in our system of government, and its decisions must be awaited before the nation knows what even an addition to the Constitution itself really signifies. The changes which the war had brought about were embodied in the new amendments to the Constitution, but there was much dispute as to how far-reaching those changes would prove to be. It was held by many, and Congress passed laws based upon the theory, that these amendments had greatly minimized the powers of the States and correspondingly enlarged those of the Federal Government. The Supreme Court alone could decide. Fortunately it was still composed entirely of judges who had been appointed by presidents belonging to the party which had carried through the amendments and which had based upon them the assumption of greater authority for the General Government. A long series of decisions, of which the last and, in some respects, the most important (in the Virginia debt cases) was rendered only a few weeks before Justice Waite's death, settled these disputed questions and established the rights of the States under the amended Constitution upon a basis entirely satisfactory to the party whose President was to name his successor. It was frankly confessed by candid Democratic journals that, so far as a correct interpretation of the Constitution was concerned, it was to them a matter of no consequence whether Justice Waite's chair were filled by a Republican of his type or by a Democrat. One needs only to recall the bitterness with which the decisions of the Supreme Court were received by the opposition party during the compromise generation to appreciate how wonderful is the change, and how complete the work of settlement after the terrible storm of civil war.

A crowd of issues press for the attention of the new generation, but one overshadows all the rest. The Union has been reconstructed upon an enduring basis; now the Government itself is to be reconstructed. The slavery of human bondage has been abolished; the servitude of the spoils system is now to be done away with. This is the work of the new political generation, and there is happily abundant evidence that it will prove equal to the task.

Edward P. Clark.

CHRISTIANITY THE CONSERVATOR OF AMERICAN CIVILIZATION.

CIVILIZATION has from the earliest times developed a centripetal force that has tended to the aggregation of the mass of the population in cities. That force did its work in ancient times in Egypt, in Greece, and in Rome. It is doing its work now in modern Europe and in this country.

At the end of the war of the Revolution the population of the United States numbered nearly four millions. There were then but 6 cities, and in those 6 cities there dwelt 130,000 people; so that of the total population of the country at that time $3\frac{1}{3}$ per cent. was to be found in the cities. In the century that has passed since then the national development has been so directed that there are now 286 cities, and of the total population in the United States, which now amounts to more than 50,000,000, $11\frac{1}{3}$ millions are dwellers in cities; that is to say, $22\frac{1}{2}$ per cent., or more than one-fifth of the entire population of the United States to-day, is to be found in the cities. Of that urban population very nearly one-half is in ten cities, and nearly one-third is in the cities of New York, Philadelphia, and Chicago, including as a part of New York its tributary cities of Brooklyn and Jersey City.

American citizenship has its duties as well as its rights, its responsibilities as well as its privileges. The proper exercise of the right of suffrage requires in him who exercises it a high degree of intelligence; yet, of the more than two million voters in our cities, a majority are not sufficiently educated to exercise intelligently the right of suffrage, and a formidable minority are ignorant and vicious. As Lord Sherbrooke said in England with reference to the new voters upon whom the Reform Act of 1867 conferred the suffrage, "We must educate our *masters*," so we can well say with reference to the masses in our large cities, "We must educate *our* masters."

Education is in this connection a word of large import. It means something more than the perfunctory acquisition of facts, and something more than the development of the mind

as an intellectual machine. It means the bringing to bear upon every individual in the mass every influence that can tend to make him better as a man and better as a citizen.

The common-school system will not do the work of the education that we need, for that system, even if it were practically efficient, deals only with children, and it fails in that the tendency of its method of instruction is to direct the pupils, not to trades, not to mechanical work of any description, but exclusively to clerical labor; and the consequence is that the supply of that kind of labor is so greatly in excess of the demand for it that but a small proportion of the applicants can possibly obtain employment, and the unemployed applicants drift into vice and crime, not from any predisposition thereto, but because their compulsory idleness exposes them to temptation. We therefore cannot rely for the education of the masses upon the public-school system.*

Nor can we rely upon any system of merely philosophical training. That experiment has been tried again and again in the world's history. The philosophic systems of Greece and Rome culminated in the barbarism of the Middle Ages. The abstract philosophy of reason in France was crowned by the Reign of Terror.

If history has proved to demonstration any one fact it has proved this, that without Christianity there is now no possibility of an enduring civilization. If this be true of countries whose forms of government are monarchical or aristocratic, much more is it true here, where every citizen is entitled to an equal voice in the selection of the makers and administrators of the laws. Therefore we must find the solution of our problem in bringing the principles of Christianity to bear upon the population of our cities, for just so far as those principles leaven the mass will the individuals become better citizens, and will politics be purified.

There are certain inevitable results which follow upon the crowding of masses of people in cities. These are, first, an excess of demand over supply in the necessities of life,

* Of 2127 convicts who have been received in the Pennsylvania Eastern State Penitentiary from 1875 to 1884, inclusive, 1547 had been pupils of the common schools; 65 had been pupils of private schools; 452 had never attended school; 1939 had never been apprenticed to any trade; 75 had been apprenticed, but

had left their trade before serving out their time; and 113 had been apprenticed and served out their time. These figures do not mean that the 1547 pupils of the public schools had received in those schools any instruction which in any way tended to incite them to crime, but they fortify the conclusion stated in the text.

and a consequently increased cost of living; secondly, an excess of supply over demand in all departments of labor, professional, clerical, and mechanical, and for the many a constantly increasing difficulty in obtaining the means of living; thirdly, for the few, wealth and luxury, and for the many, poverty and suffering; and, fourthly, a development of crime, intemperance, and other vices.

There is, therefore, poverty to be relieved, suffering to be alleviated, and sorrow to be comforted. Means of prevention must also be used. The sale of intoxicating liquors must be restrained. The reformatory agencies that clothe and educate the homeless youth and those other reformatory agencies that work upon the vicious and criminal classes must be fostered, stimulated, and strengthened.

Of course, much of this charitable work of all sorts is done and will continue to be done by the voluntary and unsectarian action of individuals and organizations; but all such work, by whomsoever done, is really animated, whether ostensibly or not, by that truly charitable spirit which is inspired by Christianity, and it is the office of every church to encourage that work, and to furnish volunteers for its performance.

It is another result of the growth of cities that in periods of business depression there are gathered together large bodies of unemployed and possibly starving men and women, who, under the pressure of their unfortunate circumstances, fall an easy prey to demagogues, and may be incited to acts of violence. Under any system of government this result of the centralization of population has been and always will be of grave importance.

Now, too, modern civilization is threatened from within by a foe who preaches the false gospel of a Godless humanity based upon the logic of dynamite and assassination, and that false gospel finds ready acceptance when it is preached to men who are both ignorant and starving.

We have heretofore flattered ourselves, with somewhat of national complacency, and in the exercise of a very practical materialism, that, whatever might befall the governments of Europe, here at least our free institutions and our boundless expanse of territory would protect us from the dangers which threaten European society; but we are beginning to realize that like causes will always produce like results, and that the congregation of the masses in cities, the aggrandizement of the few, and the depression of the many have combined to develop antagonistic forces the possible collision of which is full of danger.

Pagan Rome dealt with the difficulty in a spirit of conciliation that was epigrammatically expressed in the phrase *Panem et circenses*; that is to say, the government freely distributed food to the masses and provided for their entertainment the shows of the arena. Continental Europe deals with the difficulty in a spirit of stern repression, and endeavors by standing armies and police to hold the masses in subjection. Yet both systems failed. The armed mob accomplished in Rome the work which communism and nihilism are doing in Europe in our day.

We cannot have a standing army of adequate size, and if we undertake to maintain large bodies of men in idleness and to amuse them at the public expense we shall invite the very danger against which we would guard.

Christianity must be used as our conservative force, for it deals with man as an individual in his personal responsibility to his God, and it deals with him also as a citizen in his relation to organized society. It preaches, by example rather than by precept, the power of Christian charity, which is limited only by human need for human help. It teaches the rich that wealth is a trust, not a gift. It neutralizes class antagonisms by bringing home to men the great doctrine of the brotherhood of man.

The Christianity that is to do this great work must be a living Christianity; it must be aggressive; it must be liberal; it must be united; it must not confine itself to a merely defensive warfare. It must hold the outworks of civilization, not only by keeping watch and ward, but also by leading sorties against the besieging forces of unreason.

This work cannot be done only by throwing wide the doors of churches, holding service, and preaching sermons. It must also be done in the highways and the byways, among the rich and the poor, the virtuous and the vicious, the innocent and the guilty. It must be done by the laity as well as by the clergy; and its most persuasive sermons will find their expression not in words but in deeds, and not in exposition or argument or entreaty, but in the silent yet eloquent lessons of lives of self-sacrifice.

With the necessity for this great work staring us in the face, let us, agreeing about the essentials of the Christian faith, agree to disagree as to minor matters; and recognizing our points of agreement, and dwelling upon them to the exclusion of our points of disagreement, let us, as soldiers in one army and under one banner, move forward shoulder to shoulder.

Christopher Stuart Patterson.

THE TOMSK FORWARDING PRISON.

THE rapidity with which the season of good weather and good roads was passing, and the length and arduous nature of the journey that still lay before us, compelled us to make our stay in the city of Ust Kamenogorsk very brief. The work that we accomplished there, however,

had an important bearing upon the prosecution of our researches in the field of political exile, and rendered our success in that field almost certain. I had always anticipated great difficulty in ascertaining where political exiles were to be found, and how they could be approached without the asking of too many dangerous questions. We could not expect in

A POST STATION ON THE BARNAUL ROAD.

AN OLD SIBERIAN FERRY-BOAT.

every town to stumble, by good luck, upon a liberal and sympathetic official who would aid us in our search, and yet experience had shown us the absolute necessity of knowing definitely in advance where to go and whom to approach. We had already passed through half a dozen towns or villages where there were colonies of interesting political exiles, and where, if we had been aware of the presence of these, we should have stopped; but we had no clues whatever to them, and I feared that if, in searching for clues, we made a practice of asking questions at random, we should soon attract the attention of the police and be called upon to explain what business we had with political exiles, and why we were everywhere looking them up. At Ust Kamenogorsk this source of embarrassment was finally removed. We not only obtained there a mass of useful information and a great number of valuable hints and suggestions, but we carried away with us notes of recommendation to people who could aid us, letters of introduction to liberal officials in the towns through which we were yet to pass, and a manuscript list, or directory, in which were set forth the names, ages, professions, and places of banishment of nearly seven hundred political exiles in all parts of Siberia. After we had obtained these letters of introduction and this "underground" directory, the Government could have prevented us from inves-

tigating the exile system only by removing us forcibly from the country. We no longer had to grope our way by asking hazardous questions at random. We could take every step with a certainty of not making a mistake, and could go, in every village, directly to the persons whom we wished to see.

On Monday, August 10, we dined for the last time with the politicals in Ust Kamenogorsk, sang to them once more, by special request, "John Brown's Body" and "The Star-spangled Banner," and at 6 o'clock in the evening set out by post for Barnaul and Tomsk. The road, as far as the post station of Pianoyarofskaya, was the same that we had followed in going from Semipalatinsk to the Altai Station. The country that it intersected seemed to us more parched and barren than ever, but here and there, in the moister places, we passed large flocks of fat-tailed sheep, guarded and watched by Kirghis horsemen, whose hooded heads and black faces, with the immense goggles of horse-hair netting that they wore to protect their eyes from the glare of the sun, gave them an almost demoniacal appearance. Occasionally, in the outskirts of the villages, we saw fields of cultivated sunflowers, or of half-ripe watermelons and cantaloupes; but as a rule the steppe was uncultivated and could not be cultivated without artificial irrigation. The weather was still very warm, and in almost every village we noticed naked children playing in the streets.

At Pianoyarofskaya we left the Semipalatinsk road and the valley of the Irtysh, and turning to the northward crossed the low divide which separates the water-shed of the Irtysh from that of the Ob, and entered the province of Tomsk. A large quantity of rain had fallen, followed by a comfortable temperature; but the muddy roads hindered us, and the post stations, where we got very little to eat, were filthy

MAP OF THE TRIP.

and swarming with bed-bugs. In the stations of Shemanaiefskaya and Saushkina, after vainly attempting to sleep, I sat up and wrote throughout the whole of two nights, killing fifteen or twenty bed-bugs each night on my writing-

an unusual number of pretentious dwelling-houses and residences with columns and imposing façades, but most of them have fallen into decay. They were erected many years ago, at a time when a mining officer of the

MARKET-PLACE IN BARNAUL.

table. The lack of proper food, the constant jolting, and the impossibility of getting any sleep, soon reduced us to an extremely jaded and exhausted condition, and when we reached the town of Barnaul, Friday afternoon, August 14, after an almost sleepless journey of ninety-six hours, I was hardly able to sit up.

Barnaul is a large town of 17,000 inhabitants, and is the center of the rich and important mining district of the Altai. It contains

Crown in Barnaul received 2000 or 3000 rubles a year as salary and stole 100,000 rubles a year by means of "cooked" accounts, and when, according to tradition, he paid twice the amount of his own salary to a French governess for his children, and as much more to a French culinary chef, and sent his soiled linen to Paris by mail to be washed and starched.

The mines of the Altai are, for the most

OLD PRISON OR GUARD-HOUSE IN BARNAUL.

part, the private property of the Tsar. In the nine years from 1870 to 1879 they produced 6984 pounds of gold, 206,964 pounds of silver, 9,639,620 pounds of copper, and 13,221,396 pounds of lead. A large part of the gold and silver ore is smelted in Barnaul.

Mr. Frost, with an amount of enterprise which was in the highest degree creditable to him, explored the city with sketch-book and camera, and took photographs of the bazar, of peasant women carrying stones on hand-barrows near the mining "works," and of a curious building, not far from our hotel, which seemed to have been intended for a Russo-Ionic temple but which afterward had apparently been transformed into a jail, in order to bring it more nearly into harmony with the needs of the place. I should have accompanied him upon some of these excursions, but I was nearly sick from sleeplessness. The dirty hotel in Barnaul was alive with bed-bugs, and I was compelled to sleep every night on a table, or rather stand, about four feet long by three wide, set out in the middle of the room. Owing to the fact that I generally rolled off or capsize the table as soon as I lost consciousness, my sleep was neither prolonged nor refreshing, and before we left Barnaul I was reduced to a state

bordering on frenzy. Almost the only pleasant recollection that I have of the city is the memory of receiving there eighteen letters from home—the first I had had since our departure from Tiumen.

Tuesday afternoon, August 18, we left Barnaul for Tomsk. The part of Western Siberia that lies between these two cities is a fertile rolling country, diversified by birch groves and wide stretches of cultivated land, and suggestive a little of the southern part of New England. Mr. Frost, whose home is in Massachusetts, said he could easily imagine that he was "up Berkshire way." The scenery, although never wild, is everywhere pleasing and picturesque; the meadows, even in August, are carpeted with flowers; and the greenness and freshness of the vegetation, to a traveler who comes from the desert-like steppes of the upper Irtysh, are a source of surprise and gratification. Near the first station we passed the small lake of Kolivan, which is celebrated in all that part of Siberia for the picturesque beauty of its scenery, and Mr. Frost made a sketch of some fantastic rocks by the roadside. It is a favorite place of resort in summer for the wealthy citizens of Barnaul and Tomsk. It had been our intention to spend a day or two in exploring this picturesque sheet of water, but we

FERRY ON THE RIVER OB NEAR BARNAUL.

finally decided that we could not spare the time. We crossed the river Ob on a curious "parom," or ferry-boat, consisting of a large platform supported upon two open hulks and propelled by a paddle-wheel at one end, the crank of which was turned by two ragged-bearded old muzhiks. Most of the Siberian rivers are crossed by means of what are known as "pendulum ferries," in which the boat is anchored by a long cable made fast in the middle of the stream, and is swung from shore to shore pendulum-wise by the force of the current. The Ob ferry-boat, of which Mr. Frost made a sketch, was the first one we had seen propelled by a paddle-wheel.

So far as I can remember, there was little on the route between Barnaul and Tomsk to attract a traveler's attention. I was terribly jaded and exhausted from lack of sleep,

and spent a large part of the time in a state which was little more than one of semi-consciousness.

At 4 o'clock on the afternoon of Thursday, August 20, we rode at last into the city of Tomsk. We had made, with horses, in the 51 days which had elapsed since our departure from Tiumen, a journey of more than 1500 miles, in the course of which we had inspected two large prisons, made the acquaintance of three colonies of political exiles, and visited the wildest part of the Russian Altai. We drove at once to the European Hotel, which is the building shown at the extreme right of the illustration on page 865, secured a fairly comfortable room, and as soon as possible after dinner removed our clothing and stretched our weary bodies out in civilized beds for the first time in nearly two months.

KOLIVAN LAKE.

Tomsk, which is the capital of the province of the same name, is a city of 31,000 inhabitants, and is situated partly on a bluff, and partly on low land adjoining the river Tom, a short distance above its junction with the Ob. In point of size and importance it is the second city in Siberia, and in enterprise, intelligence, and prosperity it seemed to me to be the first. It contains about 8000 dwelling-houses and other buildings, 250 of which are brick; 33 churches, including a Roman Catholic church, a Mohammedan mosque, and 3 Jewish synagogues; 26 schools, attended by about 2500 scholars; a very good public library; 2 tri-weekly newspapers, which, however, the Minister of the Interior keeps closed a large part of the time on account of their "pernicious tendency"; and a splendid new university building, which has been completed three years, but which the Government will not allow to be opened for fear that it too will have a "pernicious tendency" and become a center of liberal thought. The streets of the city are not paved and are very imperfectly lighted, but at the time of our visit they seemed to be reasonably clean and well cared for, and the town, as a whole, impressed me much more favorably than many towns of its class in European Russia.

The province of which Tomsk is the capital has an area of 330,000 square miles, and is therefore about seven times as large as the State of Pennsylvania. It contains 8 towns, each

of which has on an average 14,000 inhabitants, and 2719 villages, each of which has on an average 366 inhabitants, so that its total population is about 1,100,000. Of this number 90,000 are aborigines, and 30,000 communal exiles, or common criminals banished from European Russia. The southern part of the province is very fertile, is well timbered and watered, and has a fairly good climate. The 3,600,000 acres of land which it has under cultivation yield annually about 30,000,000 bushels of grain and 4,500,000 bushels of potatoes, with smaller quantities of hemp, flax, and tobacco, while the pastures around the villages support about 2,500,000 head of live stock.

From these statistics it will be seen that in spite of bad government, restricted immigration, and the demoralizing influence of criminal exile, the province of Tomsk is not wholly barren or uncivilized. If it were in the hands of Americans, and if free immigration from European Russia to it were allowed, it might soon become as densely populated and as prosperous as any of our North-western states. Its resources are almost illimitable, and all that it needs is good government and freedom for the play of private enterprise. As long, however, as a despotic administration at St. Petersburg can gag its newspapers for months at a time, keep its university closed, choose the teachers and prescribe the courses of study for its schools, prohibit the reading of the

best books in its libraries, bind its population hand and foot by a rigid passport system, govern it through corrupt and wretchedly paid chinovniks, and pour into it every year a flood of common criminals from European Russia, just so long it will remain what it now is—a naturally enterprising and promising colony strangled by oppressive and unnecessary guardianship. The Government, just at the present time, proposes to develop the re-

to whom we had letters of introduction, and ascertain from them the facts that were necessary for our guidance. We found that the governor of the province, Mr. Krassofski, was absent from the city, and that his place was being temporarily filled by State Councilor Nathaniel Petukhof, the presiding officer of the provincial administration, who was represented to us as a man of intelligence, education, and some liberality. As soon as I

GROTESQUE ROCKS NEAR KOLIVAN LAKE.

sources of the province by building through it a railroad. It might much better loosen the grasp in which it holds the people by the throat, permit them to exercise some judgment with regard to the management of their own affairs, allow them freely to discuss their needs and plans in their own newspapers, abolish restrictions upon personal liberty of movement, stop the sending there of criminal exiles, and then let the province develop itself. It does not need "development" half as much as it needs to be let alone.*

Our first step in Tomsk was to call upon the political exiles and upon several army officers

* The reader will understand, I trust, that considerations of space compel me to omit for the present the mass of facts upon which these conclusions rest. The particular object of our journey to Siberia was the investigation of the exile system; and in order to have space for the adequate treatment of that subject, I am forced to neglect, for a time, the government of Siberia and the economic condition of the Siberian provinces.

conveniently could, I called upon Mr. Petukhof, and was received by him with great cordiality. He had read, as I soon learned, my book upon North-eastern Siberia; and since it had made a favorable impression upon him, he was predisposed to treat me with consideration and with more than ordinary courtesy. I, in turn, had heard favorable reports with regard to his character; and under such circumstances, we naturally drifted into a frank and pleasant talk about Siberia and Siberian affairs. At the end of half an hour's conversation he asked me if there was any way in which he could be of assistance to me. I replied that I should like very much to have

That I have not exaggerated the evils which arise in Siberia from the corrupt and incapable control of a despotic bureaucracy, I shall hereafter show by quotations from the official reports of Siberian governors and governors-general and by the statements of hundreds of peasants, merchants, miners, army officers, newspaper men, and chinovniks in all parts of the country.

PEASANT WOMEN AT WORK.

permission to visit the exile forwarding prison. I fancied that his face showed, for an instant, a trace of embarrassment; but as I proceeded to describe my visits to prisons in two other provinces, he seemed to come to a decision, and, without asking me any questions as to my motives, said, "Yes, I will give you permission; and, if you like, I will go with you." Then, after a moment's hesitation, he determined, apparently, to be frank with me, and added gravely, "I think you will find it the worst prison in Siberia." I expressed a hope that such would not be the case, and said that it could hardly be worse than the forwarding

prison in Tiumen. He shrugged his shoulders slightly, as if to say, "You don't know yet what a Siberian prison may be," and asked me what could be expected when buildings were crowded with more than twice the number of persons for which they were intended. "The Tomsk forwarding prison," he continued, "was designed to hold 1400 prisoners.* It now contains more than 3000, and the convict barges, as they arrive from Tiumen, increase the number by from 500 to 800 every week, while we are able to forward eastward only 400 a week. The situation is, therefore, becoming worse and worse as the summer advances. The

* According to the report of the Inspector of Exile Transportation for 1885, this prison would accommodate 1900 prisoners, with an allowance of eight-tenths

of a cubic fathom of air space per capita. Page 27 of the manuscript report. Mr. Petukhof, in his estimate, did not perhaps allow for such close packing as this.

A PART OF THE MARKET SQUARE AT TOMSK.

prison kameras are terribly overcrowded: it is impossible to keep them clean; the vitiation of the air in them causes a great amount of disease, and the prison hospital is already full to overflowing with the dangerously sick."

"But," I said, "why do you not forward exiles eastward more rapidly and thus relieve the congestion in this prison? Why can you not increase the size of your marching parties, or send forward two parties a week instead of one?"

"It is impracticable," replied the acting governor. "The Exile Administration of Eastern Siberia says that it cannot receive and distribute prisoners faster than it does now. Its étapes are too small to accommodate larger parties, and the conveying force of soldiers is not adequate to take care of two parties a week. We tried one year the plan that you suggest, but it did not work well."

"Does the Government at St. Petersburg know," I inquired, "of this state of affairs?"

"Certainly," he replied. "It has been reported upon every year, and, besides writing, I have sent four urgent telegrams this summer asking if something cannot be done to relieve this prison."

"And has nothing been done?"

"Nothing whatever. The number of prisoners here will continue to increase steadily up to the close of river navigation, when the

convict barges will stop running, and then we shall gradually clear out the prison during the winter months. In the mean time typhus fever will prevail there constantly, and great numbers of sick will lie uncared for in their cells because there is no room for them in the hospitals. If you visit the prison, my advice to you is to breakfast heartily before starting, and to keep out of the hospital wards."

I thanked him for his caution, said that I was not afraid of contagion, and asked when it would be convenient for him to go with me to the prison. A day was agreed upon, and I took my leave.

On my way home I accidentally met Colonel Yagodkin, the chief military officer of the district, who had welcomed us to Tomsk with great kindness and hospitality, and had taken a friendly interest in our researches. He said he had just called at our hotel to inform us that a convict barge from Tiumen had arrived that morning at the steamer-landing two or three miles from the city, and to say that if we would like to see the reception of a convict party, he would go to the landing with us and introduce us to the chief officer of the local exile bureau. I thanked him for his thoughtfulness, and in ten minutes Mr. Frost, Colonel Yagodkin, and I were driving furiously over a muddy road towards the pristan, or landing-place. Although we made all possible

A STATION OF THE TOMSK FIRE DEPARTMENT.

haste, the prisoners had disembarked before we reached our destination. We found them assembled in two dense gray throngs at the ends of a long wooden shed, which was surrounded and turned into a sort of cattle-pen by a high plank wall. Here they were identified, counted, and turned over by the convoy officer to the warden of the Tomsk forwarding prison. The shed was divided transversely through the middle by a low wooden barricade, at one end of which was a fenced inclosure, about ten feet square, for the accommodation of the officers who had to take part in the reception of the party. About half the exiles had been formally "received" and were standing at the eastern end of the shed, while the other half were grouped in a dense throng at the western end, waiting for their names to be called. The women, who stood huddled together in a group by themselves, were mostly in peasant costumes, with bright-colored kerchiefs over their heads, and their faces, I thought, showed great anxiety and apprehension. The men all wore long gray overcoats over coarse linen shirts and trousers; most of them were in chains, and the bare heads of the convicts and the penal colonists had been half shaved longitudinally in such a way that one side of the scalp was smooth and blue, while the other side was hidden by long, neglected hair. Soldiers stood here and there around the shed, leaning upon their bayoneted rifles, and inside the little inclosure

were the convoy officer of the party, the warden and the surgeon of the Tomsk forwarding prison, the chief of the local bureau of exile administration, and two or three other officers, all in full uniform. Colonel Yagodka introduced us as American travelers who desired to see the reception of an exile party, and we were invited to stand inside the inclosure.

The officer who was conducting the examination of the convicts drew a folded paper from a large bundle in his hand, opened and glanced at it, and then shouted, "Nikolai Koltsof!" A thin, pale man, with heavy, wearied eyes and a hopeless expression of face, who was standing in the front rank of the exile party, picked up the gray linen bag that lay beside him on the floor, and with a slow clink, clink, clink of chains walked to the inclosure. The examining officer compared his face carefully with a photograph attached to the "stateini speesok," or "identification paper," in order to make sure that the pale man had not "exchanged names" with some other exile, while a Cossack orderly examined him from head to foot and rummaged through his bag to see that he had

neither lost nor surreptitiously sold the articles of clothing that he had received in Moscow or Tiumen, and that his "stateini speesok" called for.

"Is everything there?" inquired the officer. "Everything," replied the Cossack.

"Stoopai!" ["Pass on!"] said the lieutenant; and the pale-faced man shouldered his bag and joined the ranks of the "received" at the eastern end of the shed.

"The photographs are a new thing," whispered Colonel Yagodkin to me; "and only a part of the exiles have them. They are intended to break up the practice of exchanging names and identities."

"But why should they wish to exchange names?" I inquired.

"If a man is sentenced to hard labor at the mines," he replied, "and has a little money, he always tries to buy secretly the name and identity of some poor devil of a colonist who longs desperately for a drink of vodka, or who wants money with which to gamble. Of course the convoy officer has no means of preventing this sort of transaction, because he cannot possibly remember the names and faces of the four or five hundred men in his party. If the convict succeeds in finding a colonist who is willing to sell his name, he takes the colonist's place and is assigned a residence in some village, while the colonist takes the convict's place and goes to the mines. Hundreds of hard-labor convicts escape in this way."*

"Hassan Abdallimof!" called the examining officer. No one moved.

"Hassan Abdallimof!" shouted the Cossack orderly, more loudly.

"Go on, Stumpy; that's you!" said half a dozen exiles in an undertone as they pushed out of the throng a short, thickly set, bow-legged Tartar, upon whose flat, swarthy face there was an expression of uncertainty and bewilderment.

"He doesn't know Russian, your High Nobility," said one of the exiles respectfully, "and he is gloopovati" [dull-witted].

"Bring him here," said the officer to the Cossack orderly.

When Hassan had been examined, he did not shoulder his bag and go to his place as he should have done, but began to bow and gesticulate, and to make supplications in the Tartar language, becoming more and more excited as he talked.

"What does he say?" inquired the officer. "Find some soldier who knows Tartar." An interpreter was soon found and Hassan repeated his story.

*I shall explain this practice of exchanging names more fully in a later article.

"He says, your High Nobility," translated the interpreter, "that when he was arrested they took eight rubles from him and told him the money would be given back to him in Siberia. He wants to know if he cannot have some of it now to buy tea."

"Nyettoo chai!" ["No tea!"] said the Tartar mournfully, with a gesture of utter desolation.

"To the devil with him!" cried the officer furiously. "What does the blank blank mean by delaying the reception of the party with such a trifle? This is no place to talk about tea! He'll receive his money when he gets to his destination. Away with him!" And the poor Tartar was hustled into the eastern end of the shed.

"Ivan Dontremember—the red-headed," shouted the examining officer.

"That's a brodyag" (a vagrant or tramp), whispered Colonel Yagodkin to me as a sun-burned, red-headed muzhik in chains and leg-fetters, and with a tea-kettle hanging from his belt, approached the inclosure. "He has been arrested while wandering around in Western Siberia; and as there is something in his past history that he does not want brought to light, he refuses to disclose his identity, and answers all questions with 'I don't remember.' The tramps all call themselves 'Ivan Dontremember,' and they're generally a bad lot. The penalty for belonging to the 'Dontremember' family is five years at the mines." The examining officer had no photograph of "Ivan Dontremember, the red-headed," and the latter's identity was established by ascertaining the number of teeth that he had lost, and by examining a scar over his right ear.

One by one the exiles passed in this way before the examining officer until all had been identified, counted, and turned over, and then the warden of the Tomsk forwarding prison gave a receipt to the convoy officer of the barge for 551 prisoners, including 71 children under 15 years of age, who were accompanying their fathers or mothers into exile.

At the end of the verification and reception some of the officers returned to the city; but Colonel Yagodkin, Mr. Frost, and I remained to see the surgical examination of the sick and disabled, and to inspect the convict barge. Doctor Orzheshko, the surgeon of the Tomsk prison, then took the place that had been occupied by the examining officer, laid a stethoscope and two or three other instruments upon a small table beside him, and began a rapid examination of a long line of incapacitated men, some of whom were really sick and some of whom were merely shamming. The object of the examination was to ascertain how many of the prisoners were unable to walk, in order

A FAMILY "KAMERA" IN THE TOMSK FORWARDING PRISON.

that the requisite number of telegas might be provided for their transportation to the city. The first man who presented himself was thin, pale, and haggard, and in reply to a question from the surgeon said, with a sepulchral cough, that his breast hurt him and that he could not breathe easily. Dr. Orzheshko felt his pulse, put a stethoscope to his lungs, listened for a moment to the respiratory murmur, and then said briefly, "Pass on; you can walk." The next man had a badly swollen ankle, upon which his leg-fetter pressed heavily, evidently causing him great pain. He looked imploringly at the doctor while the latter examined the swollen limb, as if he would beseech him to have mercy; but he said not a word, and when his case was approved and a wagon was ordered for him, he crossed himself devoutly three times, and his lips moved noiselessly, as if he were saying softly under his breath, "I thank thee, O God!"

There were forty or fifty men in the line of prisoners awaiting examination, and the surgeon disposed of them at the rate of about one a minute. Some had fever, some were suffering from rheumatism; some were manifestly in an advanced stage of prison consumption, and all seemed to me sick, wretched, or weak enough to deserve wagons; but the experienced senses of the surgeon quickly detected the malingerers and the men who were only slightly indisposed, and quietly bade them "Pass on!" At the end of the examination Dr. Orzheshko reported to the prison warden that there were twenty-five persons in the party who were not able to walk to the city, and who, therefore, would have to be carried. The necessary wagons were ordered, the sick and the women with infants were placed in them, and at the order "Stroisa!" ["Form ranks!"] the convicts, with a confused clinking of chains, took positions outside the shed in a somewhat ragged column; the soldiers, with shouldered rifles, went to their stations in front, beside and behind the party; and Mr. Papelaief, the chief of the local exile bureau, stepping upon a chair, cried, "Noo rebatta" ["Well, boys"], "have you anything to say or any complaints to make?"

"No; nothing, your Nobility," replied seventy-five or a hundred voices.

"Well, then, S'Bogem" ["Go with God"].

The soldiers threw open the wooden gate of the yard or pen; the under officer shouted "Ready—March!" and with a renewed jingling of multitudinous chains, the gray column moved slowly out into the muddy road.

As soon as an opportunity presented itself, Colonel Yagodkin introduced us to Mr. Papelaief, the chief officer of the local exile bu-

reau, who supervised the reception and the forwarding of exile parties, the equipment of the convicts with clothing, and the examination and verification of their papers. Mr. Papelaief, a rather tall, thin man, with a hard, cold face, greeted us politely, but did not seem pleased to see us there, and was not disposed to permit an inspection of the convict barge.

"What do they want to go on board the barge for?" he inquired rather curtly of Colonel Yagodkin. "There is nothing to see there, and besides it is inconvenient; the women are now cleaning it."

Colonel Yagodkin, however, knew that I was particularly anxious to see in what condition the floating prison was when the convicts left it, and, a few moments later, he introduced us to the convoy officer, and again suggested a visit to the barge. This time he was successful. The convoy officer evidently did not see any reason why Colonel Yagodkin should not go on board the barge with his friends if he wished to do so, and he at once cheerfully offered to accompany us. The barge was, apparently, the same one that I had inspected in Tiumen two months before. Then it was scrupulously clean, and the air in its cabins was fresh and pure; but now it suggested a recently vacated wild-beast cage in a menagerie. It was no more dirty, perhaps, than might have been expected; but its atmosphere was heavy with a strong animal odor; its floors were covered with dried mud, into which had been trodden refuse scraps of food; its nares, or sleeping-benches, were black and greasy, and strewn with bits of dirty paper; and in the gray light of a cloudy day its dark kameras, with their small grated port-holes, muddy floors, and polluted ammoniacal atmosphere, chilled and depressed me with suggestions of human misery.

The Rev. Henry Lansdell, in a recently published magazine article,* says, "I have seen some strong statements, alleging the extreme unhealthiness of these barges, . . . and I do not suppose that they are as healthy as a first-class sanatorium."

If Mr. Lansdell made a careful examination of a convict barge immediately after the departure from it of a convict party, the idea of a "sanatorium" certainly could not have been suggested to him by anything that he saw, touched, or smelled. It suggested to me nothing so much as a recently vacated den in a zoölogical garden. It was, as I have said, no more dirty and foul than might have been expected after ten days of such tenancy; but it could have been connected in one's mind

* "Russian Convicts in the Salt Mines of Iletsk"; Harper's Magazine, May, 1888, pp. 894-910.

suffering and disease which still exist are attributable mainly to overcrowding, and overcrowding the Siberian officials cannot prevent. Ten or twelve thousand exiles are turned over to them every summer, and they must send them eastward as best they can while the season of navigation lasts. They have only three barges, and eighteen round trips are all that can be made during the time that the river remains open. They are therefore compelled to send from 600 to 800 exiles in a single barge at every trip.

The day set for our visit to the Tomsk forwarding prison was Wednesday, August 26. The acting-governor, Mr. Petukhof, sent word to me at the last moment that he would be unable to accompany us; but an inspecting party was made up of Colonel Yagodkin, Mr. Papelaief (the chief of the local exile bureau), the convoy officer of the barge, Mr. Frost, and myself. It was one of the cold, gray, gloomy days that often come to Western Siberia in the late summer, when the sky is a canopy of motionless leaden clouds, and the wind blows sharply down across the tundras from the Arctic Ocean. The air was raw, with a suggestion of dampness, and an overcoat was not uncomfortable as we rode out to the eastern end of the city.

The first glimpse that we caught of the Tomsk forwarding prison showed us that it differed widely in type from all the Siberian prisons that we had previously seen. Instead of the huge white, three-story, stuccoed building with narrow arched windows and red tin roof that we had expected to find, we saw before us something that looked like the permanent fortified camp of a regiment of soldiers, or like a small prairie village on the frontier, surrounded by a high stockade of sharpened logs to protect it from hostile Indians. With the exception of the zigzag-barred sentry boxes at the corners, and the soldiers who with shouldered rifles paced slowly back and forth along its sides, there was hardly a suggestion of a prison about it. It was simply a stockaded inclosure about three acres in extent, situated on an open prairie beyond the city limits, with a pyramidal church tower and the board roofs of 15 or 20 log buildings showing above the serrated edge of the palisade. If we had had any doubts, however, with regard to the nature of the place, the familiar jingling of chains, which came to our ears as we stopped in front of the wooden gate, would have set such doubts at rest.

* The report of the Inspector of Exile Transportation for 1884 says that the Tomsk prison contains ten of these kazarms. The warden told me that there were only eight. Accounts also differ as to the normal capacity of the prison. Acting-Governor Petukhof said

In response to a summons sent by Mr. Papelaief through the officer of the day, the warden of the prison, a short, stout, chubby-faced young officer, named Ivanenko, soon made his appearance, and we were admitted to the prison yard. Within the spacious inclosure stood twelve or fifteen one-story log buildings, grouped without much apparent regularity about a square log church. At the doors of most of these buildings stood armed sentries, and in the unpaved streets or open spaces between them were walking or sitting on the bare ground hundreds of convicts and penal colonists who, in chains and leg-fetters, were taking their daily outing. The log buildings with their grated windows, the high stockade which surrounded them, the armed sentries here and there, and the throngs of convicts who in long, gray, semi-military overcoats roamed aimlessly about the yard would doubtless have reminded many a Union soldier of the famous prison pen at Andersonville. The prison buildings proper were long, one-story, barrack-like houses of squared logs, with board roofs, heavily grated windows, and massive wooden doors secured by iron padlocks. Each separate building constituted a "kazarm," or prison ward, and each ward was divided into two large kameras, or cells, by a short hall running transversely through the middle. There were eight of these kazarms, or log prisons, and each of them was designed to accommodate 190 men, with an allowance of eight-tenths of a cubic fathom of air space per capita.* They were all substantially alike, and seemed to me to be about 75 feet long by 40 feet wide, with a height of 12 feet between floors and ceilings. The first kamera that we examined was perhaps 40 feet square, and contained about 150 prisoners. It was fairly well lighted, but its atmosphere was polluted to the last degree by over-respiration, and its temperature, raised by the natural heat of the prisoners' bodies, was fifteen or twenty degrees above that of the air outside. Two double rows of sleeping-benches ran across the kamera, but there evidently was not room enough on them for half the inmates of the cell, and the remainder were forced to sleep under them, or on the floor in the gangways between them, without pillows, blankets, or bed clothing of any kind. The floor had been washed in anticipation of our visit, but the warden said that in rainy weather it was always covered with mud and filth brought in from the yard by the feet of the prisoners, and that in

that it was originally intended to hold 1400 prisoners, while the Inspector of Exile Transportation reported in 1884 that its normal capacity was 1900. It contained, at the time of our visit, about 3500.

this mud and filth scores of men had to lie down at night to sleep. Many of the convicts, thinking that we were officers or inspectors from St. Petersburg, violated the first rule of prison discipline, despite the presence of the warden, by complaining to us of the heat, foulness, and oppressiveness of the prison air, and the terrible overcrowding, which made it difficult to move about the *kamera* in the daytime, and almost impossible to get any rest at night. I pitied the poor wretches, but could only tell them that we were not officials, and had no power to do anything for them.

For nearly an hour we went from *kazarm* to *kazarm* and from cell to cell, finding everywhere the same overcrowding, the same inconceivably foul air, the same sickening odors, and the same throngs of gray-coated convicts. At last Mr. Papelaief, who seemed disposed to hurry us through the prison, said that there was nothing more to see except the kitchen and the hospital, and that he presumed we would not care to inspect the hospital wards, inasmuch as they contained seventy or eighty patients sick with malignant typhus fever. The young convoy officer of the barge, who seconded all of Colonel Yagodkin's efforts to make us thoroughly acquainted with the prison, asked the warden if he was not going to show us the "family *kameras*" and the "bologans."

"Certainly," said the warden; "I will show them anything that they wish to see."

I had not before heard of the "bologans," and Mr. Papelaief, who had to some extent taken upon himself the guidance of the party, seemed as anxious to prevent us from seeing them as he had been to prevent us from seeing the convict barge.

The "bologans" we found to be long, low sheds, hastily built of rough pine boards, and inclosed with sides of thin, white cotton-sheeting. They were three in number, and were occupied exclusively by family parties, women, and children. The first one to which we came was surrounded by a foul ditch half full of filth, into which water or urine was dripping here and there from the floor under the cotton-sheeting wall. The bologan had no windows, and all the light that it received came through the thin cloth which formed the sides.

A scene of more pitiable human misery than that which was presented to us as we entered the low, wretched shed, can hardly be imagined. It was literally packed with hundreds of weary-eyed men, haggard women, and wailing children, sitting or lying in all conceivable attitudes upon two long lines of rough plank sleeping-benches, which ran through it from end to end, leaving gangways about four feet in width in the middle and at the sides. I

could see the sky through cracks in the roof; the floor of unmatched boards had given way here and there, and the inmates had used the holes as places into which to throw refuse and pour slops and excrement; the air was insufferably fetid on account of the presence of a great number of infants and the impossibility of giving them proper physical care; wet underclothing, which had been washed in camp-kettles, was hanging from all the cross-beams; the gangways were obstructed by piles of gray bags, bundles, bedding, and domestic utensils; and in this chaos of disorder and misery hundreds of human beings, packed together so closely that they could not move without touching one another, were trying to exist, and to perform the necessary duties of everyday life. It was enough to make one sick at heart to see, subjected to such treatment and undergoing such suffering, hundreds of women and children who had committed no crime, but had merely shown their love and devotion by going into Siberian exile with the husbands, the fathers, or the brothers who were dear to them.

As we walked through the narrow gangways from one end of the shed to the other, we were besieged by unhappy men and women who desired to make complaints or petitions.

"Your High Nobility," said a heavy-eyed, anxious-looking man to the warden, "it is impossible to sleep here nights on account of the cold, the crowding, and the crying of babies. Can't something be done?"

"No, brother," replied the warden kindly; "I can't do anything. You will go on the road pretty soon, and then it will be easier."

"Dai Bogh!" ["God grant it!"] said the heavy-eyed man as he turned with a mournful look to his wife and a little girl who sat near him on the sleeping-bench.

"Batiushka! My little father! My benefactor!" cried a pale-faced woman with an infant at her naked breast. "Won't you, for God's sake, let me sleep in the bath-house with my baby? It's so cold here nights; I can't keep him warm."

"No, *matushka*" ["my little mother"], said the warden; "I can't let you sleep in the bath-house. It is better for you here."

Several other women made in succession the same request, and were refused in the same way; and I finally asked the warden, who seemed to be a kind-hearted and sympathetic man, why he could not let a dozen or two of these unfortunate women, who had young babies, go to the bath-house to sleep. "It is cold here now," I said, "and it must be much worse at night. These thin walls of cotton-sheeting don't keep out at all the raw night air."

"It is impossible," replied the warden. "The atmosphere of the bath-house is too hot, close, and damp. I tried letting some of the nursing women sleep there, but one or two of their babies died every night, and I had to stop it."

I appreciated the hopelessness of the situation, and had nothing more to say. As we emerged from the bologan, we came upon Mr. Papelaief engaged in earnest conversation with one of the exiles, a good-looking, blonde-bearded man about thirty-five years of age, upon whose face there was an expression of agitation and excitement, mingled with a sort of defiant despair.

"I have had only one shirt in months," the exile said in a trembling voice, "and it is dirty, ragged, and full of vermin."

"Well!" said Mr. Papelaief with contemptuous indifference, "you'll get another when you go on the road."

"But when will I go on the road?" replied the exile with increasing excitement. "It may be three months hence."

"Very likely," said Mr. Papelaief coldly, but with rising temper as he saw us listening to the colloquy.

"Then do you expect a man to wear one shirt until it drops off from him?" inquired the exile with desperate indignation.

"Silence!" roared Mr. Papelaief, losing all control of himself. "How dare you talk to me in that way! I'll take the skin off from you! You'll get another shirt when you go on the road, and not before. Away!"

The exile's face flushed, and the lump in his throat rose and fell as he struggled to choke down his emotion. At last he succeeded, and, turning away silently, entered the bologan.

"How long will the women and children have to stay in these sheds?" I asked the warden.

"Until the 2d of October," he replied.

"And where will you put them then?"

He shrugged his shoulders, but said nothing.*

From the bologans we went to a "family kamera" in one of the log kazarms. Here there was the same scene of disorder and wretchedness that we had witnessed in the bologans, with the exception that the walls were of logs, and the air, although foul, was warm. Men, women, and children were sitting on the nares, lying under them, standing in throngs in the gangways, and occupying in

one way or another every available square foot of space in the kamera. I had seen enough of this sort of misery, and asked the warden to take us to the hospital, a two-story log building situated near the church. We were met at the door by Dr. Orzheshko, the prison surgeon, who was a large, heavily built man, with a strong, good face, and who was by birth a Pole.

The hospital did not differ materially from that in the prison at Tiumen, except that it occupied a building by itself, and seemed to be in better order. It was intended originally to hold 50 beds; but on account of the overcrowding of the prison it had been found necessary to increase the number of beds to 150, and still nearly 50 sick patients were unprovided for and had to lie on benches or on the floor. The number of sick in the hospital at the time of our visit was 193, including 71 cases of typhus fever. The wards, although unduly crowded, were clean and neat, the bed clothing was plentiful and fresh, and the atmosphere did not seem to me so terribly heavy and polluted as that of the hospital in Tiumen. The blackboards at the heads of the narrow cots showed that the prevalent diseases among the prisoners were typhus fever, scurvy, dysentery, rheumatism, anæmia, and bronchitis. Many of the nurses, I noticed, were women from 25 to 35 years of age, who had strong, intelligent faces, belonged apparently to one of the upper classes, and were probably medical students.

Early in the afternoon, after having made as careful an examination of the whole prison as circumstances would permit, we thanked the warden, Mr. Ivanenko, for his courteous attention, and for his evident disposition to deal with us frankly and honestly, and drove back to our hotel. It was long that night before I could get to sleep, and when I finally succeeded, it was only to dream of crowded bologans, of dead babies in bath-houses, and of the ghastly faces that I had seen in the hospital of the Tomsk forwarding prison.

Inasmuch as we did not see this prison at its worst, and inasmuch as I wish to give the reader a vivid realization, if possible, of the awful amount of human agony that the exile system causes, it seems to me absolutely necessary to say something, in closing, with regard to the condition of the Tomsk forwarding prison two months after we made to it the visit that I have tried to describe.

On my return to Tomsk from Eastern

* I learned upon my return trip that late in October 200 women and children were transferred to an empty house hired for the purpose in the city of Tomsk, and that 1000 or 1500 other exiles were taken from the forwarding prison to the city prison and to the prison of

the convict companies [arrestantski roti]. These measures were rendered imperative by the alarming prevalence of disease — particularly typhus fever — in the forwarding prison as a result of the terrible overcrowding.

Siberia, in February, I had a long interview with Dr. Orzheshko, the prison surgeon. He described to me the condition of the prison, as it gradually became more and more crowded in the late fall after our departure, and said to me: "You can hardly imagine the state of affairs that existed here in November. We had 2400 cases of sickness in the course of the year, and 450 patients in the hospital at one time, with beds for only 150. Three hundred men and women dangerously sick lay on the floor in rows, most of them without pillows or bed clothing; and in order to find even floor space for them we had to put them so close together that I could not walk between them, and a patient could not cough or vomit without coughing or vomiting into his own face or into the face of the man lying beside him. The atmosphere in the wards became so terribly polluted that I fainted repeatedly upon coming into the hospital in the morning, and my assistants had to revive me by dashing water into my face. In order to change and purify the air we were forced to keep the windows open; and, as winter had set in, this so chilled the rooms that we could not maintain, on the floor where the sick lay, a

temperature higher than 5 or 6 degrees Réaumur above the freezing point. More than 25 per cent. of the whole prison population were constantly sick, and more than 10 per cent. of the sick died."*

"How long," I inquired, "has this awful state of things existed?"

"I have been here fifteen years," replied Dr. Orzheshko, "and it has been so, more or less, ever since I came."†

"And is the Government at St. Petersburg aware of it?"

"It has been reported upon every year. I have recommended that the hospital of the Tomsk forwarding prison be burned to the ground. It is so saturated with contagious disease that it is unfit for use. We have been called upon by the prison department to forward plans for a new hospital, and we have forwarded them. They have been returned for modification, and we have modified them; but nothing has been done."

It is unnecessary to comment upon this frank statement of the Tomsk surgeon. Civilization and humanity can safely rest upon it, without argument, their case against the Tomsk forwarding prison.

* The report of the Inspector of Exile Transportation shows how rapidly the sick rate increased with the progressive overcrowding. The figures are as follows:

1885. Month.	Average daily number of sick.	Per cent. of whole prison population.
June	108	5.8
July	170	6.9
August	189	7.1
September	242	9.6
October	356	15.4
November	496	25.2

The sick rate increased steadily throughout the winter until March, when it reached high-water mark—40.7 per cent., or nearly one-half the whole prison population. [Report of Inspector of Exile Transportation for 1885, p. 30 of the manuscript.]

† For example, according to the report of the medical department of the Ministry of the Interior for 1882, 1268 prisoners were treated that year in the Tomsk forwarding prison for typhus fever, and 1311 for diphtheria, measles, and small-pox.

George Kennan.

APART.

OUT on a leafless prairie, where
No song of bird makes glad the air,
No hue of flower brings to her eyes
Outward glimpse of Paradise,—
A thousand miles and a half away,—
My lady is in love to-day.

And all her heart is singing, singing,
And every new south wind is winging
Tidings glad from her true lover,
And kisses bridge the distance over —
Lips to lips and heart to heart,
A thousand miles and a half apart.

Orelia Key Bell.

EMMA LAZARUS.

BORN JULY 22, 1849; DIED NOVEMBER 19, 1887.

NE hesitates to lift the veil and throw the light upon a life so hidden and a personality so withdrawn as that of Emma Lazarus; but while her memory is fresh, and the echo of her songs still lingers in these pages, we feel it a duty to call up her presence once more and to note the traits that made it remarkable and worthy to shine out clearly before the world. Of dramatic episode or climax in her life there is none; outwardly all was placid and serene, like an untroubled stream whose depths alone hold the strong, quick tide. The story of her life is the story of a mind, of a spirit ever seeking, ever striving, and pressing onward and upward to new truth and light. Her works are the mirror of this progress. In reviewing them the first point that strikes us is the precocity, or rather the spontaneity, of her poetic gift. She was a born singer; poetry was her natural language, and to write was less effort than to speak, for she was a shy, sensitive child, with strange reserves and reticences, not easily putting herself *en rapport* with those around her. Books were her world from her earliest years; in them she literally lost and found herself. She was eleven years old when the War of Secession broke out, which inspired her first lyric outbursts. Her poems and translations written between the ages of fourteen and seventeen were collected, and constituted her first published volume. Crude and immature as these productions naturally were, and utterly condemned by the writer's later judgment, they are, nevertheless, highly interesting and characteristic, giving, as they do, the key-note of much that afterwards unfolded itself in her life. One cannot fail to be rather painfully impressed by the profound melancholy pervading the book. The opening poem is "In Memoriam" — on the death of a school friend and companion; and the two following poems also have death for theme. "On a Lock of my Mother's Hair" gives us reflections on growing old. These are the four poems written at the age of fourteen. There is not a wholly glad and joyous strain in the volume, and we might smile at the recurrence of broken vows, broken hearts, and broken lives in the experience of this maiden just entered upon her teens, were it not that the innocent child herself is in such deadly earnest. The two long

narrative poems, "Bertha" and "Elfrida," are also tragic in the extreme. Both are dashed off apparently at white heat — "Elfrida," over 1500 lines of blank verse, in two weeks; "Bertha," in three and a half. We have said that Emma Lazarus was a born singer, but she did not sing, like a bird, for joy of being alive; and of being young, alas! there is no hint in these youthful effusions, except inasmuch as this unrelieved gloom, this ignorance of "values," so to speak, is a sign of youth, common especially among gifted persons of acute and premature sensibilities, whose imagination, not yet focused by reality, overreaches the mark. With Emma Lazarus, however, this somber streak has a deeper root; something of birth and temperament is in it — the stamp and heritage of a race born to suffer. But dominant and fundamental though it was, Hebraism was only latent thus far. It was classic and romantic art that first attracted and inspired her. She pictures Aphrodite the beautiful, arising from the waves, and the beautiful Apollo and his loves — Daphne, pursued by the god, changing into the laurel, and the enamored Clytie into the faithful sunflower. Beauty, for its own sake, supreme and unconditioned, charmed her primarily and to the end. Her restless spirit found repose in the pagan idea — the absolute unity and identity of man with nature, as symbolized in the Greek myths, where every natural force becomes a person, and where in turn persons pass with equal readiness and freedom back into nature again.

In this connection a name would suggest itself even if it did not appear — Heine the Greek, Heine the Jew, Heine the Romanticist, as Emma Lazarus herself has styled him; and already in this early volume of hers we have trace of the kinship and affinity that afterwards so plainly declared itself. Foremost among the translations are a number of his songs, rendered with a finesse and a literalness that are rarely combined. Four years later, at the age of twenty-one, she published her second volume, "Admetus and Other Poems," which at once took rank as literature both in America and England, and challenged comparison with the work of established writers. Of classic themes we have "Admetus" and "Orpheus," and of romantic, the legend of Tannhäuser and of the saintly Lohengrin. All are treated with an artistic finish that shows perfect mastery of her craft, without

detracting from the freshness and flow of her inspiration. While sounding no absolutely new note in the world, she yet makes us aware of a talent of unusual distinction, and a highly endowed nature—a sort of tact of sentiment and expression, an instinct of the true and beautiful, and that quick intuition which is like second-sight in its sensitiveness to apprehend and respond to external stimulus. But it is not the purely imaginative poems in this volume that most deeply interest us. We come upon experience of life in these pages; not in the ordinary sense, however, of outward activity and movement, but in the hidden undercurrent of being. "The epochs of our life are not in the visible facts, but in the silent thoughts by the way-side as we walk." This is the motto, drawn from Emerson, which she chooses for her poem of "Epochs," which marks a pivotal moment in her life. Difficult to analyze, difficult above all to convey, if we would not encroach upon the domain of private and personal experience, is the drift of this poem, or rather cycle of poems, that ring throughout with a deeper accent, and a more direct appeal, than has yet made itself felt. It is the drama of the human soul—"the mystic winged and flickering butterfly," "flitting between earth and sky, in its passage from birth to death."

A golden morning of June! "Sweet empty sky without a stain." Sunlight and mist and "ripple of rain-fed rills." "A murmur and a singing manifold."

What simple things be these the soul to raise
To bounding joy, and make young pulses beat
With nameless pleasure, finding life so sweet.

Such is youth, a June day, fair and fresh and tender with dreams and longing and vague desire. The morn lingers and passes, but the noon has not reached its height before the clouds begin to rise, the sunshine dies, the air grows thick and heavy, the lightnings flash, the thunder breaks among the hills, rolls and gathers and grows, until

Behold, yon bolt struck home,
And over ruined fields the storm hath come!

Now we have the phases of the soul—the shock and surprise of grief in the face of the world made desolate. Loneliness and despair for a space, and then, like stars in the night, the new births of the spirit, the wonderful outcoming from sorrow: the mild light of patience at first; hope and faith kindled afresh in the very jaws of evil; the new meaning and worth of life beyond sorrow, beyond joy; and finally duty, the holiest word of all, that leads at last to victory and peace. The poem rounds and completes itself with

the close of "the long rich day," and the release of

The mystic winged and flickering butterfly,
A human soul, that drifts at liberty
Ah! who can tell to what strange paradise,
To what undreamed-of fields and lofty skies!

We have dwelt at some length upon this poem, which seems to us in a certain sense subjective and biographical; but upon closer analysis there is still another conclusion to arrive at. In "Epochs" we have, doubtless, the impress of a calamity brought very near to the writer and profoundly working upon her sensibilities; not, however, by direct, but by reflex, action, as it were, and through sympathetic emotion—the emotion of the deeply stirred spectator, of the artist, the poet, who lives in the lives of others and makes their joys and their lives his own.

Before dismissing this volume we may point out another clue as to the shaping of mind and character. The poem of "Admetus" is dedicated "to my friend Ralph Waldo Emerson." Emma Lazarus was between seventeen and eighteen years of age when the writings of Emerson fell into her hands, and it would be difficult to overestimate the impression produced upon her. As she afterwards wrote: "To how many thousand youthful hearts has not his word been the beacon—nay, more, the guiding star—that led them safely through periods of mental storm and struggle!" Of no one is this more true than of herself. Left, to a certain extent, without compass or guide, without any positive or effective religious training, this was the first great moral revelation of her life. We can easily realize the chaos and ferment of an over-stimulated brain, steeped in romantic literature and given over to the wayward leadings of the imagination. Who can tell what is true, what is false, in a world where fantasy is as real as fact? Emerson's word fell like truth itself, "a shaft of light shot from the zenith," a golden rule of thought and action. His books were bread and wine to her, and she absorbed them into her very being. She felt herself invincibly drawn to the master, "that fount of wisdom and goodness," and it was her great privilege during these years to be brought into personal relations with him. From the first he showed her a marked interest and sympathy which became for her one of the most valued possessions of her life. He criticised her work with the fine appreciation and discrimination that made him quick to discern the quality of her talent as well as of her personality, and he was no doubt attracted by her almost transparent sincerity and singleness of soul, as well as by the simplicity and modesty that would have

been unusual even in a person not gifted. He constituted himself, in a way, her literary mentor, advised her as to the books she should read and the attitude of mind she should cultivate. For some years he corresponded with her very faithfully; his letters are full of noble and characteristic utterances, and give evidence of a warm regard that in itself was a stimulus and a high incentive. But encouragement even from so illustrious a source failed to elate the young poetess, or even to give her a due sense of the importance and value of her work or the dignity of her vocation. We have already alluded to her modesty, but there was something more than modesty in her unwillingness to assert herself or claim any prerogative—something even morbid and exaggerated which we know not how to express, whether as oversensitiveness or indifference. Once finished, the heat and glow of composition spent, her writings apparently ceased to interest her. She often resented any allusion to them on the part of intimate friends, and the public verdict as to their excellence could not reassure or satisfy her. The explanation is not far, perhaps, to seek. Was it not the “*Das ewig Weibliche*” that allows no prestige but its own? Emma Lazarus was a true woman, too distinctly feminine to wish to be exceptional or to stand alone and apart, even by virtue of superiority.

A word now as to her life and surroundings. She was one of a family of seven, and her parents were both living. Her winters were passed in New York and her summers by the sea. In both places her life was essentially quiet and retired. The success of her book had been mainly in the world of letters. In no wise tricked out to catch the public eye, her writings had not yet made her a conspicuous figure, but were destined slowly to take their proper place and give her the rank that she afterwards held.

For some years now almost everything that she wrote was published in “*Lippincott's Magazine*,” then edited by John Foster Kirk, and we shall still find in her poems the method and movement of her life. Nature is still the fount and mirror, reflecting, and again reflected, in the soul. We have picture after picture almost to satiety, until we grow conscious of a lack of substance and body and of vital play to the thought, as though the brain were spending itself in dreamings and reverie, the heart feeding upon itself, and the life choked by its own fullness without due outlet. Happily, however, the heavy cloud of sadness has lifted, and we feel the subsidence of waves after a storm. She sings “*Matins*”:

Does not the morn break thus,
Swift, bright, victorious,
With new skies cleared for us

Over the soul storm-tost?
Her night was long and deep,
Strange visions vexed her sleep,
Strange sorrows bade her weep,
Her faith in dawn was lost.

No halt, no rest for her,
The immortal wanderer
From sphere to higher sphere
Toward the pure source of day.
The new light shames her fears,
Her faithlessness and tears,
As the new sun appears
To light her god-like way.

Nature is the perpetual resource and consolation. “‘T is good to be alive!” she says, and why? Simply,

To see the light
That plays upon the grass, to feel (and sigh
With perfect pleasure) the mild breezes stir
Among the garden roses, red and white,
With whiffs of fragrancy.

She gives us the breath of the pines and of the cool, salt seas, “illimitably sparkling.” Her ears drink the ripple of the tide, and she stops

To gaze as one who is not satisfied
With gazing at the large, bright, breathing sea.

“*Phantasies*” (after Robert Schumann) is the most complete and perfect poem of this period. Like “*Epochs*,” it is a cycle of poems, and the verse has caught the very trick of music—alluring, baffling, and evasive. This time we have the landscape of the night, the glamour of moon and stars—pictures half real and half unreal, mystic imaginings, fancies, dreams, and the enchantment of “*faërie*,” and throughout the unanswered cry, the eternal “*Wherefore*” of destiny. Dawn ends the song with a fine clear note, the return of day, night's misty phantoms rolled away, and the world, itself again green, sparkling and breathing freshness.

In 1874 she published “*Alide*,” a romance in prose drawn from Goethe's autobiography. It may be of interest to quote the letter she received from Turgeneff on this occasion:

Although, generally speaking, I do not think it advisable to take celebrated men, especially poets and artists, as a subject for a novel, still I am truly glad to say that I have read your book with the liveliest interest. It is very sincere and very poetical at the same time; the life and spirit of Germany have no secrets for you, and your characters are drawn with a pencil as delicate as it is strong. I feel very proud of the approbation you give to my works and of the influence you kindly attribute to them on your own talent; an author who writes as you do is not a pupil in art any more; he is not far from being himself a master.

Charming and graceful words, of which the young writer was justly proud.

About this time occurred the death of her mother, the first break in the home and family

circle. In August of 1876 she made a visit to Concord at the Emersons', memorable enough for her to keep a journal and note down every incident and detail. Very touching to read now, in its almost childlike simplicity, is this record of "persons that pass and shadows that remain." Mr. Emerson himself meets her at the station and drives with her in his little one-horse wagon to his home, the gray square house with dark green blinds, set amidst noble trees. A glimpse of the family—"the stately, white-haired Mrs. Emerson and the beautiful, faithful Ellen, whose figure seems always to stand by the side of her august father." Then the picture of Concord itself, lovely and smiling, with its quiet meadows, quiet slopes, and quietest of rivers. She meets the little set of Concord people: Mr. Alcott, for whom she does not share Mr. Emerson's enthusiasm, and William Ellery Channing, whose figure stands out like a gnarled and twisted scrub-oak—a pathetic, impossible creature, whose cranks and oddities were submitted to on account of an innate nobility of character. "Generally crabbed and reticent with strangers, he took a liking to me," says Emma Lazarus. "The bond of our sympathy was my admiration for Thoreau, whose memory he actually worships, having been his constant companion in his best days and his daily attendant in the last years of illness and heroic suffering. I do not know whether I was most touched by the thought of the unique, lofty character that had inspired this depth and fervor of friendship, or by the pathetic constancy and pure affection of the poor, desolate old man before me, who tried to conceal his tenderness and sense of irremediable loss by a show of gruffness and philosophy. He never speaks of Thoreau's death," she says, "but always 'Thoreau's loss,' or 'when I lost Mr. Thoreau,' or 'when Mr. Thoreau went away from Concord'; nor would he confess that he missed him, for there was not a day, an hour, a moment when he did not feel that his friend was still with him and had never left him. And yet a day or two after," she goes on to say, "when I sat with him in the sunlit wood, looking at the gorgeous blue and silver summer sky, he turned to me and said: 'Just half of the world died for me when I lost Mr. Thoreau. None of it looks the same as when I looked at it with him.' . . . He took me through the woods and pointed out to me every spot visited and described by his friend. Where the hut stood is a little pile of stones and a sign, 'Site of Thoreau's Hut,' and a few steps beyond is the pond with thickly wooded shores—everything exquisitely peaceful and beautiful in the afternoon light, and not a sound to be heard except the crickets or

the 'z-ing' of the locusts which Thoreau has described. Farther on he pointed out to me in the distant landscape a low roof, the only one visible, which was the roof of Thoreau's birthplace. He had been over there many times, he said, since he lost Mr. Thoreau, but had never gone in—he was afraid it might look lonely! But he had often sat on a rock in front of the house and looked at it." On parting from his young friend, Mr. Channing gave her a package which proved to be a copy of his own book on Thoreau and the pocket compass which Thoreau carried to the Maine woods and on all his excursions. Before leaving the Emersons she received the proof-sheets of her drama of "The Spagnoletto," which was being printed for private circulation. She showed them to Mr. Emerson, who had expressed a wish to see them, and after reading them he gave them back to her with the comment that they were "good." She playfully asked him if he would not give her a bigger word to take home to the family. He laughed, and said he did not know of any; but he went on to tell her that he had taken it up not expecting to read it through, and had not been able to put it down. Every word and line told of richness in the poetry, he said, and as far as he could judge, the play had great dramatic opportunities. Early in the autumn "The Spagnoletto" appeared—a tragedy in five acts, the scene laid in Italy, 1655.

Without a doubt, every one in these days will take up with misgiving and, like Mr. Emerson, "not expecting to read it through," a five-act tragedy of the seventeenth century, so far removed apparently from the age and present actualities—so opposed to the "Modernité," which has come to be the last word of art. Moreover, great names at once appear; great shades arise to rebuke the presumptuous newcomer in this highest realm of expression. "The Spagnoletto" has grave defects that would probably preclude its ever being represented on the stage. The dénouement especially is unfortunate and sins against our moral and æsthetic instinct. The wretched, tiger-like father stabs himself in the presence of his crushed and erring daughter, so that she may forever be haunted by the horror and the retribution of his death. We are left suspended, as it were, over an abyss, our moral judgment thwarted, our humanity outraged. But "The Spagnoletto" is nevertheless a remarkable production, and pitched in another key from anything the writer has yet given us. Heretofore we have only had quiet, reflective, passive emotion: now we have a storm and sweep of passion for which we were quite unprepared. Ribera's character is charged like a thunder-cloud with dramatic elements.

Maria Rosa is the child of her father, fired at a flash, "deaf, dumb, and blind," at the touch of passion.

Does love steal gently o'er our soul?

she asks;

What if he come,
A cloud, a fire, a whirlwind?

and then the cry:

O my God!
This awful joy in mine own heart is love.

Again:

While you are here the one thing real to me
In all the universe is love.

Exquisitely tender and refined are the love scenes — at the ball and in the garden — between the dashing prince-lover in search of his pleasure and the devoted girl with her heart in her eyes, on her lips, in her hand. Behind them, always like a tragic fate, the somber figure of the Spagnoletto, and over all, the glow and color and soul of Italy.

In 1881 appeared the translation of Heine's poems and ballads, which was generally accepted as the best version of that untranslatable poet. Very curious is the link between that bitter, mocking, cynic spirit and the refined, gentle spirit of Emma Lazarus. Charmed by the magic of his verse, the iridescent play of his fancy, and the sudden cry of the heart piercing through it all, she is as yet unaware or only vaguely conscious of the real bond between them — the sympathy in the blood, the deep, tragic, Judaic passion of eighteen hundred years that was smoldering in her own heart, soon to break out and change the whole current of her thought and feeling.

Already, in 1879, the storm was gathering. In a distant province of Russia at first, then on the banks of the Volga, and finally in Moscow itself, the old cry was raised, the hideous medieval charge revived, and the standard of persecution unfurled against the Jews. Province after province took it up. In Bulgaria, Servia, and, above all, Roumania, where, we were told, the sword of the Czar had been drawn to protect the oppressed, Christian atrocities took the place of Moslem atrocities, and history turned a page backward into the dark annals of violence and crime. And not alone in despotic Russia, but in Germany, the seat of modern philosophic thought and culture, the rage of Anti-Semitism broke out and spread with fatal ease and potency. In Berlin itself tumults and riots were threatened. We in America could scarcely comprehend the situation or credit the reports, and for a while we shut our eyes and ears to the facts; but we were soon rudely awakened from our insensi-

bility, and forced to face the truth. It was in England that the voice was first raised in behalf of justice and humanity. In January, 1881, there appeared in the London "Times" a series of articles, carefully compiled on the testimony of eye-witnesses, and confirmed by official documents, records, etc., giving an account of events that had been taking place in southern and western Russia during a period of nine months, between April and December of 1880. We do not need to recall the sickening details. The headings will suffice: outrage, murder, arson, and pillage, and the result — 100,000 Jewish families made homeless and destitute, and nearly \$100,000,000 worth of property destroyed. Nor need we recall the generous outburst of sympathy and indignation from America. "It is not that it is the oppression of Jews by Russia," said Mr. Evarts in the meeting at Chickering Hall Wednesday evening, February 4; "it is that it is the oppression of men and women by men and women, and we are men and women." So spoke civilized Christendom, and for Judaism — who can describe that thrill of brotherhood, quickened anew, the immortal pledge of the race, made one again through sorrow? For Emma Lazarus it was a trumpet call that awoke slumbering and unguessed echoes. All this time she had been seeking heroic ideals in alien stock, soulless, and far removed; in pagan mythology and mystic, medieval Christianity, ignoring her very birthright — the majestic vista of the past, down which, "high above flood and fire," had been conveyed the precious scroll of the Moral Law. Hitherto Judaism had been a dead letter to her. Of Portuguese descent, her family had always been members of the oldest and most orthodox congregation of New York, where strict adherence to custom and ceremonial was the watchword of faith; but it was only during her childhood and earliest years that she attended the synagogue and conformed to the prescribed rites and usages which she had now long since abandoned as obsolete and having no bearing on modern life. Nor had she any great enthusiasm for her own people. As late as April, 1882, she published in THE CENTURY MAGAZINE an article written probably some months before, entitled, "Was the Earl of Beaconsfield a Representative Jew?" in which she is disposed to accept as the type of the modern Jew the brilliant, successful, but not over-scrupulous *chevalier d'industrie*. In view of subsequent, or rather contemporaneous, events, the closing paragraph of the article in question is worthy of being cited:

Thus far their religion [the Jewish], whose mere preservation under such adverse conditions seems little short of a miracle, has been deprived of the natural

means of development and progress, and has remained a stationary force. The next hundred years will, in our opinion, be the test of their vitality as a people; the phase of toleration upon which they are only now entering will prove whether or not they are capable of growth.

By a curious, almost fateful juxtaposition, in the same number of the magazine appeared Madame Ragozin's defense of Russian barbarity, and in the following (May) number Emma Lazarus's impassioned appeal and reply, "Russian Christianity *versus* Modern Judaism." From this time dated the crusade that she undertook in behalf of her race, and the consequent expansion of all her faculties, the growth of spiritual power which always ensues when a great cause is espoused and a strong conviction enters the soul. Her verse rang out as it had never rung before — a clarion note, calling a people to heroic action and unity; to the consciousness and fulfillment of a grand destiny. When has Judaism been so stirred as by "The Crowing of the Red Cock" and

THE BANNER OF THE JEW.

Wake, Israel, wake! Recall to-day
The glorious Maccabean rage,
The sire heroic, hoary-gray,
His five-fold lion-lineage;
The Wise, the Elect, the Help-of-God,
The Burst-of-Spring, the Avenging Rod.

From Mizpeh's mountain-ridge they saw
Jerusalem's empty streets; her shrine
Laid waste where Greeks profaned the Law
With idol and with pagan sign.
Mourners in tattered black were there
With ashes sprinkled on their hair.

Then from the stony peak there rang
A blast to ope the graves; down poured
The Maccabean clan, who sang
Their battle-anthem to the Lord.
Five heroes lead, and following, see
Ten thousand rush to victory!

Oh, for Jerusalem's trumpet now,
To blow a blast of shattering power,
To wake the sleepers high and low,
And rouse them to the urgent hour!
No hand for vengeance — but to save,
A million naked swords should wave.

Oh, deem not dead that martial fire,
Say not the mystic flame is spent!
With Moses' law and David's lyre,
Your ancient strength remains unbent.
Let but an Ezra rise anew,
To lift the *Banner of the Jew*!

A rag, a mock at first — ere long,
When men have bled and women wept,
To guard its precious folds from wrong,
Even they who shrunk, even they who slept,
Shall leap to bless it and to save.
Strike! for the brave revere the brave!

The dead forms burst their bonds and lived again. She sings "Rosh Hashanah" (the

Jewish New Year) and "Hanuckah" (the Feast of Lights):

Kindle the taper like the steadfast star
Ablaze on Evening's forehead o'er the earth,
And add each night a luster till afar
An eight-fold splendor shine above thy hearth.
Clash, Israel, the cymbals, touch the lyre,
Blow the brass trumpet and the harsh-tongued horn;
Chant psalms of victory till the heart take fire,
The Maccabean spirit leap new-born.

And "The New Ezekiel":

What, can these dead bones live, whose sap is dried
By twenty scorching centuries of wrong?
Is this the House of Israel whose pride
Is as a tale that's told, an ancient song?
Are these ignoble relics all that live
Of psalmist, priest, and prophet? Can the breath
Of very heaven bid these bones revive,
Open the graves, and clothe the ribs of death?
Yea, Prophecy, the Lord hath said again:
Say to the wind, Come forth and breathe afresh,
Even that they may live, upon these slain,
And bone to bone shall leap, and flesh to flesh.
The spirit is not dead, proclaim the word.
Where lay dead bones a host of armed men stand!
I ope your graves, my people, saith the Lord,
And I shall place you living in your land.

Her whole being renewed and refreshed itself at its very source. She threw herself into the study of her race, its language, literature, and history.

Breaking the outward crust, she pierced to the heart of the faith and "the miracle" of its survival. What was it other than the ever-present, ever-vivifying spirit itself, which cannot die — the religious and ethical zeal which fires the whole history of the people and of which she herself felt the living glow within her own soul? She had come upon the secret and the genius of Judaism — that absolute interpenetration and transfusion of spirit with body and substance which, taken literally, often reduces itself to a question of food and drink, a dietary regulation, and again, in proper splendor, incarnates itself and shines out before humanity in the prophets, teachers, and saviors of mankind.

Those were busy, fruitful years for Emma Lazarus, who worked, not with the pen alone, but in the field of practical and beneficent activity. For there was an immense task to accomplish. The tide of immigration had set in, and ship after ship came laden with hunted human beings flying from their fellow-men, while all the time, like a tocsin, rang the terrible story of cruelty and persecution — horrors that the pen refuses to dwell upon. By hundreds and thousands they flocked upon our shores — helpless, innocent victims of injustice and oppression, panic-stricken in the midst of strange and utterly new surroundings.

Emma Lazarus came into personal contact with these people, and visited them in their

refuge on Ward's Island. While under the influence of all the emotions aroused by this great crisis in the history of her race she wrote the "Dance to Death," a drama of persecution of the twelfth century, founded upon authentic records — unquestionably her finest work in grasp and scope and, above all, in moral elevation and purport. The scene is laid in Nordhausen, a free city of Thuringia, where the Jews, living, as they deemed, in absolute security and peace, were caught up in the wave of persecution that swept over Europe at that time. Accused of poisoning the wells and causing the pestilence, or black death, as it was called, they were condemned to be burned.

We do not here intend to enter upon a critical or literary analysis of the play, or to point out dramatic merits or defects, but we should like to make its readers feel with us the holy ardor and impulse of the writer and the spiritual import of the work. The action is without surprise, the doom fixed from the first; but so glowing is the canvas with local and historic color, so vital and intense the movement, so resistless the "internal evidence," if we may call it thus, penetrating its very substance and form, that we are swept along as by a wave of human sympathy and grief. In contrast with "The Spagnoletto," how large is the theme and how all-embracing the catastrophe. In place of the personal we have the drama of the universal. Love is only a flash now — a dream caught sight of and at once renounced at a higher claim.

Have you no smile to welcome love with, Liebhaid?
Why should you tremble?
Prince, I am afraid!
Afraid of my own heart, my unfathomed joy,
A blasphemy against my father's grief,
My people's agony!

What good shall come, forswearing kith and God,
To follow the allurements of the heart?

asks the distracted maiden, torn between her love for her princely wooer and her devotion to the people among whom her lot has been cast.

O God!
How shall I pray for strength to love him less
Than mine own soul!

No more of that,
I am all Israel's now. Till this cloud pass,
I have no thought, no passion, no desire,
Save for my people.

Individuals perish, but great ideas survive — fortitude and courage, and that exalted loyalty and devotion to principle which alone are worth living and dying for.

The Jews pass by in procession — men, women, and children — on their way to the flames, to the sound of music, and in festal

array, carrying the gold and silver vessels, the roll of the law, the perpetual lamp and the seven-branched silver candle-stick of the synagogue. The crowd hoot and jeer at them.

The misers! they will take their gems and gold
Down to the grave!

Let us rejoice

sing the Jewish youths in chorus; and the maidens:

Our feet shall stand within thy gates, O Zion!
Within thy portals, O Jerusalem!

The flames rise and dart among them; their garments wave, their jewels flash, as they dance and sing in the crimson blaze. The music ceases, a sound of crashing boards is heard and a great cry — "Hallelujah!" What a glory and consecration of martyrdom! Where shall we find a more triumphant vindication and supreme victory of spirit over matter?

I see, I see,
How Israel's ever-crescent glory makes
These flames that would eclipse it dark as blots
Of candlelight against the blazing sun.
We die a thousand deaths — drown, bleed, and burn.
Our ashes are dispersed unto the winds.
Yet the wild winds cherish the sacred seed,
The waters guard it in their crystal heart,
The fire refuseth to consume.

Even as we die in honor, from our death
Shall bloom a myriad heroic lives,
Brave through our bright example, virtuous
Lest our great memory fall in disrepute.

The "Dance to Death" was published along with other poems and translations from the Hebrew poets of medieval Spain, in a small volume entitled "Songs of a Semite." The tragedy was dedicated, "In profound veneration and respect to the memory of George Eliot, the illustrious writer who did most among the artists of our day towards elevating and ennobling the spirit of Jewish nationality."

For this was the idea that had caught the imagination of Emma Lazarus — a restored and independent nationality and repatriation in Palestine. In her article in *THE CENTURY* of February, 1883, on the "Jewish Problem," she says:

I am fully persuaded that all suggested solutions other than this are but temporary palliatives. . . . The idea formulated by George Eliot has already sunk into the minds of many Jewish enthusiasts, and it germinates with miraculous rapidity. "The idea that I am possessed with," says Deronda, "is that of restoring a political existence to my people; making them a nation again, giving them a national center, such as the English have, though they, too, are scattered over the face of the globe. That is a task which presents itself to me as a duty. . . . I am resolved to devote my life to it. At the least, I may awaken a movement in other minds such as has been awakened in my own." Could the noble prophetess who wrote the above words have lived but

till to-day to see the ever-increasing necessity of adopting her inspired counsel, . . . she would have been herself astonished at the flame enkindled by her seed of fire, and the practical shape which the movement projected by her in poetic vision is beginning to assume.

In November of 1882 appeared her first "Epistle to the Hebrews"—one of a series of articles written for "The American Hebrew," published weekly through several months. Addressing herself now to a Jewish audience, she sets forth without reserve her views and hopes for Judaism, now passionately urging its claims and its high ideals, and again dispassionately holding up the mirror for the shortcomings and peculiarities of her race. She says :

Every student of the Hebrew language is aware that we have in the conjugation of our verbs a mode known as the *intensive voice*, which, by means of an almost imperceptible modification of vowel-points, intensifies the meaning of the primitive root. A similar significance seems to attach to the Jews themselves in connection with the people among whom they dwell. They are the *intensive form* of any nationality whose language and customs they adopt. . . . Influenced by the same causes, they represent the same results ; but the deeper lights and shadows of their Oriental temperament throw their failings, as well as their virtues, into more prominent relief.

In drawing the epistles to a close, February 24, 1883, she thus summarizes the special objects she has had in view :

My chief aim has been to contribute my mite towards arousing that spirit of Jewish enthusiasm which might manifest itself: *First*, in a return to the varied pursuits and broad system of physical and intellectual education adopted by our ancestors ; *Second*, in a more fraternal and practical movement towards alleviating the sufferings of oppressed Jews in countries less favored than our own ; *Third*, in a closer and wider study of Hebrew literature and history ; and finally, in a truer recognition of the large principles of religion, liberty, and law upon which Judaism is founded, and which should draw into harmonious unity Jews of every shade of opinion.

Her interest in Jewish affairs was at its height when she planned a visit abroad, which had been a long-cherished dream, and May 15, 1883, she sailed for England, accompanied by a younger sister. We have difficulty in recognizing the tragic priestess we have been portraying in the enthusiastic child of travel who seems new-born into a new world. From the very outset she is in a maze of wonder and delight. At sea she writes :

Our last day on board ship was a vision of beauty from morning till night—the sea like a mirror and the sky dazzling with light. In the afternoon we passed a ship in full sail, near enough to exchange salutes and cheers. After tossing about for six days without seeing a human being, except those on our vessel, even this was a sensation. Then an hour or two before sunset came the great sensation of—land ! At first, nothing but a shadow on the far horizon, like the ghost of a ship ; two or three widely scattered rocks

which were the promontories of Ireland—and sooner than we expected we were steaming along low-lying purple hills.

The journey to Chester gives her "the first glimpse of mellow England"—a surprise which is yet no surprise, so well known and familiar does it appear. Then Chester, with its quaint, picturesque streets, "like the scene of a Walter Scott novel, the cathedral planted in greenness, and the clear, gray river where a boatful of scarlet dragoons goes gliding by." Everything is a picture for her special benefit. She "drinks in, at every sense, the sights, sounds, and smells, and the unimaginable beauty of it all." Then the bewilderment of London, and a whirl of people, sights, and impressions. She was received with great distinction by the Jews, and many of the leading men among them warmly advocated her views. But it was not alone from her own people that she met with exceptional consideration. She had the privilege of seeing many of the most eminent personages of the day, all of whom honored her with special and personal regard. There was, no doubt, something that strongly attracted and attached people to her at this time—the force of her intellect at once made itself felt, while at the same time the unaltered simplicity and modesty of her character, and her readiness and freshness of enthusiasm, kept her still almost like a child.

She makes a flying visit to Paris, where she happens to be on the 14th of July—the anniversary of the storming of the Bastille, and of the beginning of the Republic ; she drives out to Versailles, "that gorgeous shell of royalty, where the crowd who celebrate the birth of the Republic wander freely through the halls and avenues, and into the most sacred rooms of the king. . . . There are ruins on every side in Paris," she says, "ruins of the Commune, or the Siege, or the Revolution ; it is terrible—it seems as if the city were seared with fire and blood."

Such was Paris to her then, and she hastens back to her beloved London, starting from there on the tour through England that has been mapped out for her. "A Day in Surrey with William Morris," published in THE CENTURY MAGAZINE, describes her visit to Merton Abbey, the old Norman monastery, converted into a model factory by the poet-humanitarian, who himself received her as his guest, conducted her all over the picturesque building and garden, and explained to her his views of art and his aims for the people.

She drives through Kent, "where the fields, valleys, and slopes are garlanded with hops and ablaze with scarlet poppies." Then Canterbury, Windsor, and Oxford, Stratford, Warwick, the valley of the Wye, Wells, Exeter, and

Salisbury — cathedral after cathedral. Back to London and then north through York, Durham, and Edinburgh, and on the 15th of September she sails for home. We have merely named the names, for it is impossible to convey an idea of the delight and importance of this trip, "a crescendo of enjoyment," as she herself calls it. Long after, in strange, dark hours of suffering, these pictures of travel arose before her, vivid and tragic even in their hold and spell upon her.

The winter of 1883-84 was not especially productive. She wrote a few reminiscences of her journey and occasional poems on Jewish themes, which appeared in the "American Hebrew"; but for the most part she gave herself up to quiet retrospect and enjoyment with her friends of the life she had had a glimpse of, and the experience she had stored — a restful, happy period. In August of the same year she was stricken with a severe and dangerous malady, from which she slowly recovered, only to go through a terrible ordeal and affliction. Her father's health, which had long been failing, now broke down completely, and the whole winter was one long strain of acute anxiety, which culminated in his death, in March, 1885. The blow was a crushing one for Emma. Truly, the silver cord was loosed, and the golden bowl was broken. Life lost its meaning and its charm. Her father's sympathy and pride in her work had been her chief incentive and ambition, and had spurred her on when her own confidence and spirit failed. Never afterwards did she find complete and spontaneous expression. She decided to go abroad again as the best means of regaining composure and strength, and sailed once more in May for England, where she was welcomed now by the friends she had made, almost as to another home. She spent the summer very quietly at Richmond, an ideally beautiful spot in Yorkshire, where she soon felt the beneficial influence of her peaceful surroundings. "The very air seems to rest one here," she writes; and inspired by the romantic loveliness of the place, she even composed the first few chapters of a novel, begun with a good deal of dash and vigor, but soon abandoned, for she was still struggling with depression and gloom.

"I have neither ability, energy, nor purpose," she writes. "It is impossible to do anything, so I am forced to set it aside for the present; whether to take it up again or not in the future remains to be seen."

In the autumn she goes on the Continent, visiting the Hague, which "completely fascinates" her, and where she feels "stronger and more cheerful" than she has "for many a day." Then Paris, which this time amazes

her "with its splendor and magnificence. All the ghosts of the Revolution are somehow laid," she writes, and she spends six weeks here enjoying to the full the gorgeous autumn weather, the sights, the picture galleries, the bookshops, the whole brilliant panorama of the life; and early in December she starts for Italy.

And now once more we come upon that keen zest of enjoyment, that pure desire and delight of the eyes, which are the prerogative of the poet — and Emma Lazarus was a poet. The beauty of the world! What a rapture and intoxication it is, and how it bursts upon her in the very land of beauty, "where Dante and where Petrarch trod." A magic glow colors it all; no mere blues and greens any more, but a splendor of purple and scarlet and emerald; "each tower, castle, and village shining like a jewel; the olive, the fig, and at your feet the roses, growing in mid-December." A day in Pisa seems like a week, so crowded is it with sensations and unforgettable pictures. Then a month in Florence, which is still more entrancing with its inexhaustible treasures of beauty and art, and finally Rome, the climax of it all,

wiping out all other places and impressions, and opening a whole new world of sensations. I am wild with the excitement of this tremendous place. I have been here a week and have seen the Vatican and the Capitoline Museums, and the Sistine Chapel, and St. Peter's, besides the ruins on the streets and on the hills, and the graves of Shelley and Keats.

It is all heart-breaking. I don't only mean those beautiful graves overgrown with acanthus and violets, but the mutilated arches and columns and dumb appealing fragments looming up in the glowing sunshine under the Roman blue sky.

True to her old attractions, it is pagan Rome that appeals to her most strongly,

and the far-away past, that seems so sad and strange and near. I am even out of humor with pictures; a bit of broken stone or a fragment of a bas-relief, or a Corinthian column standing out against this lapis-lazuli sky, or a tremendous arch, are the only things I can look at for the moment — except the Sistine Chapel, which is as gigantic as the rest, and forces itself upon you with equal might.

Already, in February, spring is in the air; "the almond trees are in bloom, violets cover the grass, and oh! the divine, the celestial, the unheard-of beauty of it all!" It is almost a pang to her, "with its strange mixture of longing and regret and delight," and in the midst of it she says, "I have to exert all my strength not to lose myself in morbidness and depression."

Early in March she leaves Rome, consoled with the thought of returning the following winter. In June she was in England again, and spent the summer at Malvern. Disease was no doubt already beginning to prey upon her, for she was oppressed at times by a languor

and heaviness amounting almost to lethargy. When she returned to London, however, in September, she felt quite well again, and started for another tour in Holland, which she enjoyed as much as before. She then settled in Paris to await the time when she could leave for Italy. But she was attacked at once with grave and alarming symptoms, that betokened a fatal end to her malady. Entirely ignorant, however, of the danger that threatened her, she kept up courage and hope, made daily plans for the journey, and looked forward to setting out at any moment. But the weeks passed and the months also; slowly and gradually the hope faded. The journey to Italy must be given up; she was not in condition to be brought home, and she reluctantly resigned herself to remain where she was and "convalesce," as she confidently believed, in the spring. Once again came the analogy, which she herself pointed out now, to Heine on his mattress-grave in Paris. She too, the last time she went out, dragged herself to the Louvre, to the feet of the Venus, "the goddess without arms, who could not help." Only her indomitable will and intense desire to live seemed to keep her alive. She sunk to a very low ebb, but, as she herself expressed it, she "seemed to have always one little window looking out into life," and in the spring she rallied sufficiently to take a few drives and to sit on the balcony of her apartment. She came back to life with a feverish sort of thirst and avidity. "No such cure for pessimism," she says, "as a severe illness; the simplest pleasures are enough—to breathe the air and see the sun."

Many plans were made for leaving Paris, but it was finally decided to risk the ocean voyage and bring her home, and accordingly she sailed July 23d, arriving in New York on the last day of that month.

She did not rally after this; and now began her long agony, full of every kind of suffering, mental and physical. Only her intellect seemed kindled anew, and none but those who saw her during the last supreme ordeal can realize that wonderful flash and fire of the spirit before its extinction. Never did she appear so brilliant. Wasted to a shadow, and between acute attacks of pain, she talked about art, poetry, the scenes of travel, of which her brain was so full, and the phases of her own condition, with an eloquence for which even those who knew her best were quite unprepared. Every faculty seemed sharpened and

every sense quickened as the "strong deliveress" approached, and the ardent soul was released from the frame that could no longer contain it.

We cannot restrain a feeling of suddenness and incompleteness and a natural pang of wonder and regret for a life so richly and so vitally endowed thus cut off in its prime. But for us it is not fitting to question or repine, but rather to rejoice in the rare possession that we hold. What is any life, even the most rounded and complete, but a fragment and a hint? What Emma Lazarus might have accomplished, had she been spared, it is idle and even ungrateful to speculate. What she did accomplish has real and peculiar significance. It is the privilege of a favored few that every fact and circumstance of their individuality shall add luster and value to what they achieve. To be born a Jewess was a distinction for Emma Lazarus, and she in turn conferred distinction upon her race. To be born a woman also lends a grace and a subtle magnetism to her influence. Nowhere is there contradiction or incongruity. Her works bear the imprint of her character, and her character of her works. The same directness and honesty, the same limpid purity of tone, and the same atmosphere of things refined and beautiful. The vulgar, the false, and the ignoble—she scarcely comprehended them, while on every side she was open and ready to take in and respond to whatever can adorn and enrich life. Literature was no mere "profession" for her, which shut out other possibilities; it was only a free, wide horizon and background for culture. She was passionately devoted to music, which inspired some of her best poems; and during the last years of her life, in hours of intense physical suffering, she found relief and consolation in listening to the strains of Bach and Beethoven. When she went abroad painting was revealed to her, and she threw herself with the same ardor and enthusiasm into the study of the great masters; her last work (left unfinished) was a critical analysis of the genius and personality of Rembrandt.

And now, at the end we ask, Has the grave really closed over all these gifts? Has that eager, passionate striving ceased, that hunger and thirst which we call life, and "is the rest, silence?"

Who knows? But would we break, if we could, that repose, that silence and mystery and peace everlasting?

AMERICAN MACHINE CANNON AND DYNAMITE GUNS.

NOT long since, in New York, a distinguished general of the Union armies, now on the retired list, gave utterance to remarks the substance of which was as follows:

The next war will be marked by terrific and fearful slaughter. So murderous have warlike weapons become, and so fertile has the inventive power of man grown in producing means of killing his fellows, that the Rebellion and the Franco-Prussian war of 1870-71 will seem mild in comparison with it. Machine cannon, dynamite guns, and magazine rifles now do in the space of a minute what formerly required hours; while steam, electricity, chemistry, and all the agents which man has called to his aid will be utilized in the work of destruction.

It is indeed so; and yet in the extreme mortality of modern war will be found the only hope that man can have of even a partial cessation of war. Taken at its best, war is a terrible thing, and bloodshed and death are necessary attributes; but, like the cut of the surgeon's knife when at its sharpest and deepest, it is bound to make the wound heal the quickest. Therefore all means which will bring the enemy to terms in the shortest possible time—except such as are absolutely objectionable—are justified in war. Americans are dubbed a peace-loving people, and are laughed at for their small army and navy and antiquated armament. How passing strange, then, that not only the first, but the most perfect, of modern weapons are their creation! The Gatling gun, the Gardner, the Lowell, the Hotchkiss, the dynamite guns, and the best of magazine rifles are their inventions. History furnishes many proofs that it is to the improvements of arms that nations have owed their success in war; and in these utilitarian days that nation which first puts into intelligent practice on the battle-field the proper use of machine guns must inevitably come off the victor. Some of us remember the halo of mystery

that attached to the mitrailleuse, at the breaking out of the Franco-Prussian war, and the tales told of this wonderful machine; we can also remember the cruel disappointment that its supporters were subjected to when it was put to the crucial test of service. It consisted of thirty-seven rifle-barrels arranged in a cylinder; the barrels being open at the breech, the cartridges were placed in a disk, which was then clamped against the barrels, and all the car-

GATLING POLICE GUN.

tridges were exploded simultaneously. The cartridges were paper-cased, a vital imperfection in machine guns. Owing to the number of barrels, the gun and carriage were heavy and cumbersome, so as to absorb the recoil of so great a discharge. Moreover, the rate of fire was not rapid, as much time was necessarily taken up in loading.

We have called the Gatling the progenitor of machine guns, because it was the first. It was invented by Dr. Robert Gatling, then of Indiana, in 1861; but though brought to the attention of the American Government, it was

not given a trial till some years after the war of the Rebellion, when, in an improved condition, it was finally adopted. Since then all the governments of the world have used more or less of them. Its first actual service of importance was in the war of 1870-71 between Germany and France. To be sure, it was not till nearly the close of the war, and when the failure of the mitrailleuse was acknowledged, that it was used. If it had been used in the beginning, the result might have been different. The following, taken from the war correspondence of the "London Journal" at the time, shows its effects:

Up to this time we had not seen any Prussians beyond a few skirmishers in the plain, though our battery of Gatlings had kept blazing away at nothing in particular all the while; but now an opportunity of its being in use occurred. A column of troops appeared in the valley below us, coming from the right—a mere dark streak upon the white snow; but no one in the battery could tell whether they were friends or foes, and the commander hesitated about opening fire. But now an aide-de-camp came dashing down the hill with orders to pound them at once—a French journalist, it seems, having discovered them to be enemies, when the general and all his staff were as puzzled as ourselves. *Rr-rr-a go* our Gatlings, the deadly hail of bullets crushes into the thick of them, and slowly back into the woods the dark mass retires, leaving, however, a trace of black dots upon the white snow behind it. This, their famous and 4 o'clock effort and its failure, has decided the day. That one discharge was enough.

The main features of the Gatling gun in the latest form may be summed up as follows:

It has from six to ten rifle-barrels, each with a corresponding lock. These barrels are grouped about and revolve around a central shaft to which they are parallel, and the barrels extend through from end to end. The breech-ends are firmly into a disk or rear barrel-plate, fastened to the shaft, and the

pass through another disk. The shaft projects beyond the muzzles and extends backward for some distance behind the breeches. The barrels and locks are revolved together around the shaft by turning a crank on the side of the casing surrounding the breech. Besides this motion, the locks have a forward and backward motion of their own, the first of which places the cartridges in the barrels and closes the breech at the time of each discharge, while the latter one extracts the empty cartridge-cases after firing. It is only when the handle or crank is worked forward, which turns the barrels from left to right, that the gun is loaded and fired. On the top of the gun is a hopper, which receives the cartridges from a feed-case; and when the gun is in action there are, in the ten-barrel gun, five cartridges going through the process of loading and five more in different stages of extraction. These several operations are continuous, and the operations of loading, firing, and extracting are carried on uniformly. The cartridge falls from the hopper into the breech-block at the top, and before it revolves so as to be underneath it is shoved into place, the hammer drawn back, and, as it reaches the lowest point of revolution, the breech is closed, the hammer released, and the cartridge fired. As it comes up on the left-hand side, the ejector and extractor is at work, the empty shell falls to the ground, and the barrel is ready for another cartridge as it reaches its place on top. Therefore in one entire revolution ten cartridges can be fired, and the number of cartridges that can be fired in a given space of time will depend upon the strength, endurance, and rapidity of action of the man who turns the crank. A new feed called, from its inventor, the Accles feed, makes the supply of cartridges positive and certain in action, and

with it, it is claimed the gun can be fired at the rate of 1200 shots per minute, and at all degrees of elevation and depression. Of course it will be understood that this rate cannot be kept up long, since the heat evolved by the discharge of 1200 cartridges is so enormous that the gun cannot stand it; the barrels heat, and the parts of the breech mechanism become jammed and clogged. Still, this gun has passed through the severest tests known on the experimental ground,

LATEST MODEL OF GATLING FIELD GUN.

has been fired at angles of elevation from 0 to 89 degrees, has been turned upside down and fired continuously in that position, showing that its feed was positive. The drum contains 102 cartridges, and the gun has a number of times emptied the drum in $2\frac{1}{2}$ seconds, and eight drums in 41.4 seconds. At one trial 63,600 cartridges were fired without stopping to wipe out or clean the barrels, and the working of the gun proved satisfactory. The gun is made in different sizes, from .42 caliber up to 1 inch. This latter size makes it practically equal to a field-piece, and indeed its range, upwards of 3000 yards, is nearly as great. The gun has a lateral motion from side to side, so that as the crank is turned it sweeps, with its fire, a wide zone. The illustrations show the different styles of gun for different purposes. The practical value of an invention is determined by the results attained in actual service, and under this test the Gatling has shown even greater superiority than on the experimental ground. During the Russo-Turkish war, the war of Chili and Peru, England's fights with Zulus, with Ashantees, in Egypt, wherever the Gatling was used, it did its work well, and rained upon the foe a hail of bullets so deadly that he was absolutely paralyzed. In the Zulu war it is stated that in one place, within a radius of 500 yards, 473 dead Zulus lay in groups of from 14 to 30, mowed down by the fire of one Gatling. The annals of war do not present any greater slaughter than that. It is claimed that the Gatling can fire for short spaces of time more shots than any other machine gun, and at greater degrees of elevation and depression. When mounted on a tripod it can traverse an entire circle, thereby covering any point desired. In naval service the smaller calibers can be mounted on tops, and thus cover the decks of an enemy's vessel, while the larger sizes are especially valuable against torpedo boats. In common with other machine guns, it requires but few men and horses to manipulate it or to transport it. For the clearing of mobs in streets, for the protection of buildings containing treasure, for use in revolts in penitentiaries, it is a terrible weapon of defense and destruction. Its adaptations for the purposes of flank defense; protecting roads, defiles, and bridges; covering crossings of streams; increasing infantry fire at critical moments;

repulsing cavalry; covering the retreat of a column; and its intensity and continuity of fire—all render it of surpassing importance.

Another machine gun, now world-famous, and of a different type from the Gatling, though the invention of an American, is the Gardner gun. If the Gatling can fire a greater number of shots per minute and at greater ranges than any other gun, on the other hand it is claimed for the Gardner that for simplicity,

TWO-BARRELED GARDNER GUN ON TRIPOD.

durability, lightness, ease of operation, and accuracy it has no equal. It is made in all calibers from .45 inch up to 1 inch. It consists of two simple breech-loading rifle-barrels placed parallel to each other 1.4 inches apart, both inclosed in a case. These two barrels are loaded and fired and relieved of shells by a mechanism at the breech which is operated, as in the Gatling, by a hand-crank. One man inserts the heads of the cartridges projecting from a feed-case into the feed-guide; another man turns the crank by which the gun is fired, and as the cartridges disappear down the feed-guide their places are supplied from another case. The operations of inserting the cartridge,

GARDNER GUN IN THE BOW OF A LAUNCH.

drawing back the hammer, releasing it, and extracting the empty shell all go on automatically within the casing around the breech, and alternately on each barrel. The weight of the two-barreled gun is about 110 pounds. It is easily carried on the backs of pack-animals, or in small boats, as shown in the illustrations. The rate of fire of this gun is barely 500 shots a minute, but this rate can be kept up continuously, and 10,000 rounds have been fired without intermission or mishap. The gun has been fired successfully and practically adopted in Italy, Denmark, Mexico, the United States, and England. In the war of the latter with Burmah a four-gun Gardner battery did great service, as will be seen by the following extracts taken from the report of Captain Lloyd, R. A., commanding a battery of four Gardner guns in that campaign:

... Having thus satisfied ourselves that we had a good weapon in our hands, we set to work to equip a battery of four guns. ... The favorite tactics of the dakoits is to lay in ambush in dense jungle, where they are at home and comparatively safe; they then fire a volley into our unsuspecting troops and depart. When the dakoits oppose our advance by clinging to the jungle in front, their position, never extensive, would be quickly searched out by our machine guns. Again, their value would be ap-

preciated in storming stockades, some of which are bullet-proof, and some are not. In the latter case the guns, having a range of two thousand yards, would keep up a stream of bullets out of the enemy's reach. ... In like manner they would be utilized in the attack on dakoit villages. ... Moreover, the power of these guns for counter-attack as well as for passive defense cannot fail to be recognized.

The aim of Mr. Gardner, the inventor, was not to make a powerful gun, but rather to establish a minimum of weight and space, and within that limit to achieve the greatest possible rapidity of fire. As compared with the Gatling, the Gardner has not so rapid a rate of fire; but the breeches being incased in water-jackets, the firing at its maximum rate can be kept up longer. The gun is easier of transport, and moreover is,

after some firing, much steadier and more accurate. The feed-case of the Gatling having a powerful spring to press the cartridges into the hopper, and this spring being operated by the turning of the crank, it follows that much more strength is required of the man who turns the crank in the Gatling than in the Gardner. A very interesting bit of history to Americans is the present given by General Grant to the Viceroy of China and the Mikado of Japan. Desiring to give these dignitaries a present which would show to some extent his appreciation of the courtesies extended to him when in China and Japan,

GARDNER GUN IN TRANSPORT.

he ordered two Gardner guns of special design to be made. On the breech of the barrel-chamber of one of the guns is the engraved inscription :

TO HIS EXCELLENCY
VICEROY LI HUNG CHANG,
FROM
U. S. GRANT.

The other gun is similarly inscribed to the Mikado of Japan. While the regular models were followed, yet special attention was given to nicety of finish of every part. The carriages and mounts of the guns are made entirely of bronze and steel. The wheels are finished in wood, the felloes of oak, and the spokes of hickory. The limber-chests, each with a capacity of 7200 rounds, are of oak and highly polished. It is understood that these guns occupy positions of honor and ornament in the palaces of their respective owners.

But great as is our admiration for the Gardner and Gatling guns, it must give way before the astonishment and wonder excited by another American invention but very recently perfected. It is the Maxim automatic machine gun, invented in 1883, but only within a year past brought to a state of wonderful and ingenious perfection. It is with a feeling almost akin to shame that we state that this gun is made in England, although the inventor is American. It is, as its name indicates, an automatic machine gun, and only requires the pressure of the finger on the trigger to explode the first cartridge, and the gun, then left alone, will load and fire itself as long as cartridges are fed to it. The gun proper consists of an ordinary gun-barrel, two-thirds of which are surrounded by a casing of metal in which water is automatically injected by each discharge of the barrel. By means of this casing, or water-jacket, it is impossible to overheat the gun by firing.

The remaining third is surrounded by a steel case of rectangular shape, inside of which is the mechanism for operating the gun. This mechanism consists of a main-spring, tumbler,

sears, and firing-pin, similar to those used in the old-fashioned pistol. In addition is the lever, which, when the gun is fired, is thrown into action by the recoil. The arrangement is at once set in motion—the empty shell withdrawn, a new cartridge inserted, the breech closed, a cartridge fired, and a certain quantity of water admitted into the water-jacket. The cartridges are placed in pockets on a belt.

GARDNER GUN ON DECK.

Each belt contains 333 of these pockets, and two or more belts may be joined together. The end of the belt is introduced in the breech-casing, and the finger pressed on the trigger to fire the first cartridge, after which the gun may be left alone, and the automatic action, set in motion by the recoil, fires the rest. As the recoil is but three-quarters of an inch, some idea may be had of the wonderful ingenuity of the gun by considering that it will fire the 666 cartridges of the double belt in a little over a minute, or at the rate of ten a second; in other words, it requires but one-tenth of a second to load the gun, fire a cartridge, throw out the empty shell, and put in a full one. Again, the recoil of the gun

MAXIM FIELD GUN WITH BULLET-PROOF SHIELD.

does another work. Over the casing is a small tank of water, and at each discharge of the gun a small quantity of cool water is injected from the cistern into the water-jacket, and after the heat of the gun has risen sufficiently, the water escapes in the form of steam from two little apertures at the front end of the jacket. The cartridge contains from 70 to 90 grains of powder, and the heat evolved in the discharge of one cartridge is sufficient to raise the temperature of the water at the rate of $1\frac{1}{2}^{\circ}$ Fahrenheit per pound. And as much heat is required to melt four pounds of iron as is necessary to evaporate five pounds of water. It can be seen from this what an effectual absorbent of heat is the water-jacket, and in fact it requires the discharge of 1000 cartridges before the water is heated sufficiently to cause steam to make its appearance. The rate of fire is regulated by means of a quadrant graduated from 200 up to 700, so that by putting the hand on this the gun not only can swing from side to side, and thus traverse with its fire a wide arc, but also can throw out such fire as is wished. The field-piece is 3 feet high, 4 feet 9 inches long from muzzle to rear of breech, and weighs but 50 pounds, and its carriage about 100 pounds. The maximum rate of firing is about 600 shots per minute, but it has fired continuously 5000 shots, and so accurately that it is said its inventor, by putting his hand on the traversing lever, has written his name on a target board 400 yards from the muzzle, *in the dark*. Comparing this gun with other machine guns, its advantages become at once apparent. Indeed, it can hardly be compared with other guns, since the field

it opens is entirely new, and of broader range than others. In machine guns the causes that render guns unserviceable are as follows: First, cartridges may and often do hang fire, due to age, or perhaps to dampness in the atmosphere at the time of firing, or to deterioration due to climate, etc. It follows, therefore, that the crank being turned by a skillful man very fast, the breech is unlocked, and the cartridge partly or wholly withdrawn while in the act of exploding, thus driving the forward end of the empty case into the chamber, and rendering the gun useless for the time being. Secondly, it has been found impossible to fire many more than 1000 rounds in rapid-succession, because of the heating of barrels and expansion of parts. Thirdly, when the cartridges are fed by *gravity* they are dependent on their own weight alone for falling into the proper position in the chamber, and therefore a skillful man may work the crank so rapidly that it becomes impossible for the cartridge to attain its proper position when fed by gravity alone, and it is crushed in the act of falling. If the cartridges are not fed by gravity but by positive feed, such as a special spring, the spring also has to be worked by the man at the crank, requiring an outlay of strength that soon renders him useless, and which jars the gun and injures its accuracy. Fourthly, the machine guns are all dependent upon a single spring extractor for throwing out the empty cartridge-case, and in rapid firing the chamber becomes clogged, the case adheres so strongly to the walls that the extractor is unable to work, and sometimes breaks.

As compared with the foregoing faults of

other guns, the Maxim stands as follows: First, since there is but one barrel, but *one* cartridge can enter at a time; and if it is bad or unserviceable it will not explode, and the gun, without recoil, stops at once, and the cartridge must be ejected before a fresh one can be inserted. The cartridge is in no danger of being prematurely exploded by hot parts, since overheating is *rendered impossible* by the water-jacket, and therefore the fire can be practically continuous. Again, the cartridges being *drawn in one by one*, automatically, the objections open to the positive and gravity feeds are obviated, and the empty shell is thrown out, since a grooved slide, moving in a transverse direction, seizes it by the head and moves it bodily. The cartridge shell cannot fasten to the walls of the chamber, because this grooved slide is an independent piece. There is also another advantage that the Maxim possesses over other machine guns. It can readily be seen that any gun having two or more barrels, in order to shoot accurately, must have both barrels absolutely parallel to the vertical plane passing through the line of sight, and when there are more than two barrels they must also be parallel to each other. An error of the smallest fraction of an inch, in the direction of the line of fire, will, at a distance of one hundred yards, amount to several feet. If a gun has errors of this sort, then is there accounted for one of the principal causes of inaccuracy of fire; and rough usage, heating, etc. only render this trouble greater. But no such mechanical difficulty exists with the Maxim, since there is but one barrel. It is simple in its mechanism, is easily taken apart, oiled and cleaned, and put together again; while its automatic action, accuracy of fire, power of regulation, and the little attention needed make it the most perfect of machine guns.

The Hotchkiss revolving cannon is another American invention, although the principal factory is in France. The revolving cannon may

be best said to be the revolver on a large scale. The gun has five barrels and five chambers, which, as they are slowly revolved, are fired in succession, and can be quickly reloaded by hand. A rate of twenty shots per minute is easily obtainable with the 6-pounder gun; but as these are cannon, the heat evolved by expenditure of so much powder is immense, and therefore makes it practically impossible to fire but a few shots at this rapid rate. The gun is made so as to throw shells from 1 pound up to 32 pounds in weight.

Although a great deal has been said about the failure of Americans to turn out heavy guns equal to those of same caliber made abroad, yet the 8-inch rifles in the navy, and the new 12-inch rifled mortar or howitzer made by the United States Army Ordnance Department, certainly are the superiors of guns of their caliber the world over. This latter gun, of which we present a picture, has a caliber of 12 inches, is rifled, and fires a 630-pound shell with 35 pounds of powder. It has been fired at angles of from 30° to 75° elevation, and at 60° gave a range of $5\frac{1}{2}$ miles. Moreover, this range is accurate; that is, if a space the size of a vessel of war be marked off, five out of every seven shots would fall either on the decks or near enough seriously to injure her at this range.

Lastly, we turn to the torpedo weapon that has excited so much wonder and interest not only at home but abroad. We mean the dynamite gun. As is well known, many attempts in years past have been made to throw shells charged with dynamite from guns fired with gunpowder; but, due to the terrific shock of discharge, the shells generally burst in the guns, and were more dangerous to those firing than to those fired at. Mr. Mefford of Ohio, in

UNITED STATES 12-INCH RIFLED BREECH-LOADING MORTAR, OR HOWITZER.

PNEUMATIC DYNAMITE SEA-COAST GUN.

1883, devised his first pneumatic gun, in which he used compressed air as the propelling power. The use of compressed air is of great advantage, the pressure being low, and diminishing so slowly as to be, for practical purposes, constant; and by automatic arrangements it can be cut off as the projectile leaves the bore, so that there is no waste. Again, the pressure is kept entirely under control by means of valves, and a constant muzzle velocity is obtained. Also, instead of heating the gun, the use of compressed air actually cools it. The gun first made was 2 inches in diameter; this was followed by one 4 inches in diameter, and then by the one represented in the illustration — 8 inches in diameter. The experiments have been conducted under the supervision of Captain C. L. Zalinski, 5th United States Artillery, and they attained a degree of perfection that astonished the world. The gun may be briefly described as follows: The barrel consists of four lengths of wrought-iron tubing $\frac{5}{8}$ of an inch thick and lined with $\frac{1}{8}$ -inch seamless brass tubing. This barrel is supported on an iron truss, which in turn rests on a carriage which is supported by two hollow cast-iron pillars. The pillars rest on a platform, which is pivoted at the front in a manner similar to that of heavy guns. To the rear of the gun, protected by a wall, are placed a boiler-engine and air pumps for keeping the reservoirs full. The traversing and leveling are controlled by pneumatic cylinders worked by means of valve-levers. The air reser-

voir consists of eight wrought-iron tubes $12\frac{1}{2}$ inches diameter, and with a total capacity of 137 cubic feet. They are arranged in two tiers on each side of the platform. On the gun are two sights resting in *V*'s on the left trunnion, and on the same side is the firing-lever, so that the same person can aim and fire the gun. A pressure-gauge, showing the air pressure at any time, is also in such a position that the person firing can see it, and thus, by changing the air pressure, can correct any shot desired. The projectile has a brass body 3 feet 4 inches long, and a conical point of wrought iron 12 inches long, and a tail made of pine wood. This is inserted in the breech, which is opened and closed by a flat disk opening inwards, and sealed by a felt wad.

The gun, on account of the uniformity of pressure of air on the projectile, can be fired with great accuracy up to two thousand yards, and, as has been demonstrated time and time again, with perfect safety. The shells are charged with from fifty to sixty pounds of gelatine or gelatinous dynamite, and in experiments made September 20, 1887, proved that within given ranges the shell was perfectly under control. So perfect are the automatic arrangements, that to fire any number of shots within a given time the reservoir does not have to be entirely recharged. The instant the projectile leaves the tube the air is cut off, and the pressure on the gauge is hardly diminished. One of the most im-

8-INCH DYNAMITE GUN.

portant features of the shell is the electric fuse—the invention of Captain Zalinski. In each shell there are two batteries—one a wet one, kept charged, and the other a dry one, which is put in action by moisture. These two are on one circuit, arranged in series, part of which is composed of fine platinum wire surrounded by gunpowder, and the end of which is in a capsule, while the other end is surrounded by fulminate of mercury, which, when detonated, explodes a small tube of dynamite, and this then explodes the main charge. The wet battery explodes the shell on impact either direct or oblique. The dry battery is arranged so that the circuit is closed by being moistened, as on striking the water, which rushes through holes in the head of the projectile, which are covered with thin metal flaps.

So perfect are the arrangements of this fuse that the shell can be exploded by the slightest contact with water, or at any depth. The gun as designated is a torpedo gun. It has not, and probably never can have, the range that powder guns have—certainly not without destroying its qualities as to accuracy; but as a torpedo, it is superior to all others. It has greater speed, costs less, is far more accurate and sure, and has a field of action above as well as below water. Arrangements are made now to mount three guns of 15-inch caliber on a special gun-boat just constructed for this purpose, and it is safe to say that this vessel is in itself capable of entering any channel and harbor in the world and clearing it of torpedoes. A few of the huge charges of dynamite detonated on the bottom would explode every torpedo, either singly or in groups, placed there, and charged with high explosives.

So terrific is the force of detonation that a charge of 200 pounds of dynamite dropped on the deck of a vessel, or exploded in the air above it, would probably kill or render *hors de*

combat every human being in that vessel, by concussion and shock alone. Of all American inventions, the dynamite gun is the only one that has had the practical encouragement of the United States Government in the shape of appropriations. Owing to the neglect of our legislators to provide means of defense for our sea-coast, we are laying up for ourselves an awful retribution, that sooner or later will visit us unless we speedily take the

8-INCH SHELL.

means to correct the evil; and through our national egotism and belief in our military genius we are losing track of the very means that help the inventive powers of our countrymen to devise wondrous weapons of offense and defense. "In peace prepare for war" should be hung up in great black letters on the walls of the council chambers of our national legislators, to warn them that the same fate has overtaken every nation that has neglected its opportunities, and that the people will not hold them guiltless when the invitations and premiums to attack us we are offering to other nations shall finally be accepted.

William R. Hamilton.

WRECK OF THE UNITED STATES COAST SURVEY SCHOONER "SILLIMAN" BY A 55-POUND SHELL. FROM THE PNEUMATIC DYNAMITE GUN, SEPTEMBER 20, 1887.

O MUSIC.

LAST night I heard a harper strike his strings all suddenly and sweetly,
And one sang with him in a voice blown like a flute upon the dark,
And as a bird's wings climb the air, forever palpitating fleetly,
The song soared, and I followed it, lost where the panting echoes hark.
The song soared like a living soul in naked beauty white and stark,
Commanding all the powers of tune with solemn spells of subtle might,
A flute, a bird, a living soul, the song swept by me in the night!

Commanding all the powers of tune, commanding all the powers of being,
While on the borderland of sleep half lapped in dreams my senses stirred,
Heaven after heaven the strain laid bare, sweet secret after secret freeing,
And all the deeps of music broke about my spirit as I heard.
And past and present were as naught within that trance of rapture blurred,
And heights where white light seethed, and depths night-blue and full of singing stars,
Were mine to tread the while that tune beat out the passion of its bars!

Then I remembered me of Saul, the young man mighty and victorious,
While towering dark and beautiful anointed on the roadside king,
And over him a fuller chiasm streamed sempiternally and glorious,
The dew of dawn, the flush of day, that morning of an ancient spring.
And faring silent on his way, he lifted not his voice to sing,
He saw no glow upon the hills, upon the sky he saw no bloom,
Earth was the same old earth to him wrapped in the mantle of his gloom.

But when he met along the hill a company of prophets hasting,
Striking psaltery, harp, and tabret, and the pipe's breath blowing clear,
When singing all at once they came, in wild accord their music wasting,
The mountain answering tune for tune with mystic voices hovering near,
With sweet rude clamor storming heaven, with faces rapt in holy fear,
Singing of smoke of sacrifice from altars on the hills and scars,
Singing of power that bends the blue, that holds the leashes of the stars—

Then as the measures round him beat and left him thrilling to their gladness,
A flame swept up and compassed him and burned the withes that bound his might,
And all his strength, to music set in a swift and sacred madness,
Broke at his lips in prophecy and filled his darkened soul with light.
For thine, O Music! child of God, the wings that lift to awful height;
The order of the universe is thine, and thine the flight of stars,
And the soul treads its kingly home but to the passion of thy bars!

Harriet Prescott Spofford.

AN IDYL OF "SINKIN' MOUNT'IN."

By the author of "Two Runaways," "Sister Todhunter's Heart," "De Valley an' de Shadder," etc.

"ZEKE! OH-H-H-H, ZEKE!"

EZEKIEL OBADIAH SYKES leaned over the tumble-down split-picket fence that had once kept the pigs and chickens from his mother's humble flower-garden, and gazed fixedly at the mountain before him. His was not a striking figure, being lank and somewhat round-shouldered. It was not even picturesque. A pair of worn jean trousers covered his lower limbs, and were held in place by knit "gal-luses," which crossed the back of his cotton shirt exactly in the middle and disappeared over his shoulders in well-defined grooves. A stained and battered wool hat hung like a

bell over his head, which rested by his chin upon a red, rough hand. The face was half covered by a reddish brown beard, the first of his budding manhood. The sun had just sunk beyond the mountain, and the great shadow that crept across the single field of starving corn and the tobacco patch deepened into twilight, and still the young man rested on the picket-fence. Occasionally he would eject into the half-defined road, which came around one side of the mountain and disappeared around the other, a stream of tobacco-juice, and pensively watch it as it lined the gravel and vanished into the soil with something like a human gasp. Once he lifted a

"ZEKE, LESS SEE HOW YER LOOK."

bare foot, and with a prolonged effort scratched with its horny toes the calf of the supporting leg. But by no motion did he dissipate the air of listlessness and despondency that hung about him.

Fortune had not smiled upon the Sykes family for many moons. There were no pigs to disturb the flower-garden overrun with prince's-feathers, bachelor's-buttons, four-o'clocks, old-maids, and sunflowers, and the dismantled gate leaned restfully against the post on which it had once hung. Somehow everything in the neighborhood of the Sykes cottage seemed inclined to lean towards something else. The cow was long gone, and the tiny little boarded shed, which straddled the sparkling spring-branch near at hand and served once as a dairy, was lurching towards the hillside. Near the staggering fence was a bench that had settled back against it, thrusting its legs well to the front, and there once nestled a score of bee-hives; but none remained, and only the great yellow and maroon butterflies that floated down the valley, and the bumblebees, reveled in the honey-flowers. Perhaps the influence of these facts weighed upon the young man's mind and cast a shadow darker than the mountain's. Certainly, as he leaned silently over the picket, he was in harmony with the surroundings.

A girl came out into the twilight of the little porch, where vines were clambering pell-mell up a rough trellis of peeled rods, and carefully poured water from a gourd into a dozen tiny pots along the edge. The pots consisted of gourds and of tin cans that had been brought home by Ezekiel from the refuse of the great hotels at The Falls, ten miles or more away. But they answered her purposes well, only they presented a somewhat incongruous appearance; for on several from which bloomed lovely geraniums — cuttings secured by Ezekiel from character-studying ladies at the same hotels — flamed great red tomatoes, and where little sprigs of coleus beamed in the shadow shone also phenomenal asparagus and the violent-hued lobster. The dress of the girl was a well-worn but neat-checked homespun, and at the throat was a bit of faded ribbon.

"D'rindy, yuh seen Ezekiel?" An elderly woman in homespun, of the same design as the girl's, stood in the doorway that led from the kitchen upon the porch, holding a coffee-pot in hand.

"No, ma'am. Zeke! Oh-h-h-h, Zeke!" The girl lifted her head and sung out the name until the mountain and the valley gave it back again and again.

"What yuh warnt, D'rindy?" The voice came from so close at hand in the gathering shadows as to startle her.

"Well, I d'clar 'ter goodness' sakes, Ezekiel, what yuh doin' out thar?"

"Nuth'n." The reply was low and careless.

"Come in an' git yuh vittuls."

"Don't warnt nuth'n, Ma. Yuh-all eat."

The woman looked out at the lone figure for a moment, then went in; and presently the girl thoughtfully followed. At the table, upon which was a pone of corn-bread, a pot of weak coffee, and a handless pitcher of molasses, the elder said:

"I 'm 'feered Ezekiel ar' ailin'. Las' night he would n' tech vittuls, an' hit ain't no better ter-night."

"Suthin' 's pesterin' 'im," Dorinda said simply; "er-pesterin' es mine." An old man sat next to her and shook his head.

"All liars, all liars!" he muttered. He was evidently very deaf, and there was not a hair on his head, which was sunken between his shoulders. "Thar warn't nair' still!" The women paid no attention to his mutterings, and presently, finishing his sop, he wiped his fingers upon his hips and shuffled into the corner of the fireplace, where he mumbled to himself awhile and then fell asleep.

"Yes, suthin' 's pesterin' 'im," said the old woman after a pause. "Ezekiel ain't like es-se'f." The girl rested her elbows on the table and watched her companion absently. Presently she said abruptly:

"Aun' Betsey, yuh reck'n Zeke hain't still er-frettin' 'bout Sal Boler gittin' j'ined ter 'er feller?"

"Maybe so; but I reck'n hard times got more ter do 'ith it. Ezekiel don't see no chance ahead now." She sighed, but added, as if to counteract its effect, "Not that I 'm distrustin'. Th' Lord 'll pervide: he allus pervides fur them as leans on 'im." Dorinda looked wistfully up into the face of her aging companion and was silent. Presently she rose and washed the few dishes, placing them upon their shelf. A few deft touches restored the room to its usual scrupulously neat condition. Returning the coffee-pot to the hearth again and the remaining bread to the spider for "Zeke," as she had always called him, in defiance of his mother's example, she went quietly to her little shed-room at the end of the porch and sat down to think. She was Dorinda Maddox, not Sykes, the daughter of a poor woman down the valley who died in the arms of Mrs. Sykes, five years before, leaving nothing she might call her own but this one lonely child. Her father and her brother had been killed in a fight with revenue officers, and the hairless driveling old man within the kitchen had suffered two years

of imprisonment; for the blood shed had not all been on one side. She had come into this household to share its increasing burdens and diminishing income, but not to eat the bread of idleness. Never had mother a tenderer daughter; never an orphan a better mother. Zeke had been her one playmate and protector, and the little room, built when she grew older, was the result of his rough carpentry.

"I wunner ef he es er-frettin' 'bout Sal Boler gittin' j'ined?" she asked herself. The romance was familiar to her in all its parts from the day when Ezekiel was smitten until faithless Sal wedded a stranger from beyond the mountain, and he sunk back into despair and silence. She stood up before a little fragment of glass and looked at herself. It was a tiny room indeed, but marvelous in its appointments. The bare boards were frescoed with autumn leaves, their tints making a glory in the half-lit place. Clusters of chestnut-burrs garnished with them hung around, and here and there, in scraped cow-horns thrust into crevices, were tucked great bunches of ferns and scarlet berries and goldenrod. A half-dozen cheap prints cut from periodicals picked up at The Falls filled the waste places, and festoons of bead-corn linked them together. But just above her glass was a cheap photograph of Zeke, taken years before in the mountains by a straggling photographer whom he had guided, representing him, as he had seen the romantic tourists, posing in the shadow of a rock, his hat in one hand, and the other, for want of a coat, thrust into his half-open shirt-front—a bare-footed mountain boy whose honest eyes looked straight into hers. This had been, from the day Ezekiel brought it home, the treasure of her girlhood. The frame about it was like none other in the world. It was of mica, made of sheets larger than any man's hand, and upon their surface with a needle she had traced ferns, butterflies, flowers, and leaves, rubbing soot into the lines to make the figures stand forth. This was her gem; and once a traveling artist who gazed upon it said that it was wonderfully true to nature, and offered to buy it. He might as well have bartered for her eyes. The little room held only her couch, a rude chest, a splint rocker, and a stool,—all Zeke's work,—a brown stone bowl, and a great jug-shaped gourd which served her for a pitcher.

As the girl stood in brown reverie before the fragment of glass she heard a horse approaching at a fox-trot, and presently a voice exclaim:

"Well, Ezekyel, how ez time er-sarvin' you an' yourn?" She recognized the drawl of an old "hard-shell" preacher who at long inter-

vals came to hold forth in the neighborhood. Then Ezekiel's voice:

"Po'ly, Parson. 'Light?"

"No; I 'm goin' ter lie at Sis' Toomer's ter-night. Will see yuh out ter Zebberlon come er-Sunday. Th' road hain't ther bes' an' hit 's er-gittin' dark — whoa! Oh, Ezekyel," — she heard the horse, which had started, checked again, — "seen Sal Boler 'cross the line las' month. Th' critter she war er-j'ined ter es dead." The girl in her little room clasped her hands and sunk back on the couch. She could but hear what followed.

"Yuh don't say!"

"Be'n dead fo' months come er-Friday. She ain't furgot you, Ezekyel." Here the speaker chuckled. "She do say that ef her life was ter come roun' ter be lived ergin, she 'd be Mistis Ezekyel Sykes down in Raccoon Holler."

"Did Sal say hit fur er fac', Parson?" His voice was low.

"She said hit fur er fac'; an' Sal hain't er-need'n' no man ter git vittuls fur *her*. The Lord he has blessed her more 'n many er prayin' ooman an' the mother er chillum, er rer, blessed be his holy name, er rer! An' I say hit er-wonderin', not er-findin' fault. Yes, Sal 's got lan' an' stock; no eend er stock."

The girl heard his horse's footfalls echo out in the distance. She waited long. Then Ezekiel entered the kitchen, and she followed quietly and placed his bread upon the table. He passed into the only remaining room without noticing her.

"Ma," she heard him say quietly, as was his way, "git me up 'bout light. I 'm goin' ter th' yan side er th' mount'in ter-morrer, an' maybe I won't git back afo' Sunday."

Dorinda turned and went out as silently as she came. In her room she threw herself face down upon the log-cabin quilt of her couch and sobbed herself asleep.

II.

WHEN Ezekiel Sykes arose next morning responsive to his mother's call, daylight was glimmering faintly on the mountain. He took from its pegs his red jean suit, the same that Sal Boler had so often seen him in, now a little the worse for wear, donned it, putting on his one other cotton shirt. Then he slicked his hair with marrow-fat from a horn, and throwing his boots, well greased, across his shoulder, rolled up his trousers. Prepared for his journey, he proceeded to the kitchen and possessed himself of a cup of cold coffee and the bread put aside for him. As he was passing out his mother came to the door.

"Fur ther Lor' sakes, Ezekiel, whar be yuh goin' ter, boy?"

"Ter the yan side o' th' mount'in, Ma," he said quietly. Then he called to her from the outside: "I reck'n yer hain't ter see me afo' Sunday."

"Well, that beats my times," she said, gazing blankly at the open door. Presently she began to dress. "Sunday-meetin' clothes on, an' hit er Chuesday! Hit 's onpossible thet Ezekiel is settin' up ter er gal over thar—" She paused with her dress half over her head. "No, hit 's onpossible; one er Ezekiel's queer notions. The boy never war jes like yuther boys. Ter think," she said, laughing softly, "ter think of folks callin' *him* 'Doctor' — 'Doctor Zeke'! But hit 's er fac' thet he do fech sum folks 'round estonishin'ly, an' thet 's erbout all any yuther doctor c'n say."

When Ezekiel Sykes took the road at early dawn he went northward; and as he strode along he whistled softly. A great change had come over him. He carried himself erect, as in olden times, and smiled responsive to his thoughts. If Dorinda could have seen him then she would have said, "Hit 's Zeke come ter his own se'f ergin." The perfidy of Sal Boler had been a crushing blow a year before; he had suffered, and his pride had been altogether annihilated. From a self-laudatory young man he had sunk into a morose and thoughtfully distrustful one. If he had had the power of expression he might have become a cynic in words, as he was in fact. He had borne up pretty well under the waning fortunes of the Sykes family and the disasters which befell them all through the father; but Sal's conduct finished him at one fell blow.

"Ef her life war ter come roun' ter be lived ergin, she 'd be Mistis Ezekyel Sykes down een Raccoon Holler," he said aloud; and then he laughed. It had been many a day since he had laughed like that, and he realized the change. "Zeke, less see how yer look," he added jubilantly. He took a small bit of glass from his coat pocket, thrust it behind the scale of a pine-tree's bark, and solemnly surveyed his countenance.

"Hit 's Zeke," he admitted, winking and twisting his head. "Zeke, Ezekiel Obadiah Sykes — Dr. Zeke. An' I reck'n she done a long sight worsen 'n looks when she j'ined unto that Calliny feller, ef she did n't in lan' an' stock." He took off his hat and bowed to Ezekiel in the glass, and smiled at Ezekiel in the glass, and rolled his tongue at Ezekiel in the glass. "Ezekiel," said he finally, "ding yuh ole skin, ef I wuz ter meet yer on ther road I 'd say, 'Ther goes er feller fit ter run er gal crazy.' I would, fer er fac'. Yer ar' er bad un." He winked with both eyes violently. "No eend to lan' an' stock!"

With a loud guffaw he returned the reflector to his pocket, and whistling and singing by turns resumed his journey. The change that had come over him was marvelous.

Ezekiel had covered about fifteen miles and was upon a better road when overtaken by a spanking team driven by a good-natured, easy-going young man, who hailed him pleasantly.

"Ride, stranger?"

"In course," said Zeke; "an' glad ter get hit. How fur yer travelin'?"

"Up about Red Creek."

"Well, now, thet's what I calls luck," said Zeke, as he settled down on the proffered seat. "So 'm I."

The young man smiled at the speaker's general appearance and manner. His own shoes were on and blacked, and there was a well-bred business look about him that Ezekiel noticed.

"Be yuh er-stayin' thar?"

"Yes," said the stranger, looking at him keenly but slyly. "Where do you hail from?"

"Raccoon Holler."

"Farming?"

"Some, an' er-docterin' some."

"So! You are a doctor, then. Allopathic or homeopathic?"

Ezekiel reflected. "Mostly yarbs," he said.

His companion smiled again. "I see; one of nature's doctors. Best sort, after all."

Under this flattering admission Ezekiel expanded at once.

"Think so?"

"I do, indeed."

Ezekiel stretched out his hand. "Glad to know yuh. What mout be your name?"

"Tom Summers."

"Dr. Ezekiel Obadiah Sykes," he said gravely.

"Glad to know you, Doc. It is lonesome up here; glad to have your company."

"T is kinder lonesome," admitted Ezekiel. Then, after a pause: "But, stranger, you kinder fetched me erwhile back when yuh war er-talkin' 'bout natur' an' er-docterin' 'cordin' ter natur'."

"Indeed!"

"Thet's my way. I hain't be'n ter school, an' what I got war picked up hyah 'n' thar f'om one 'n' ernuther. Folks got ter callin' me 'Dr. Zeke,' an' so hit goes; an' Dr. Zeke hit ar' till now; an' some er um 'u'd tell yuh thet Dr. Zeke knowed er thing er two maybe ef yer asked um."

"I have no doubt of it."

"Hit war the funniest thing th' way hit come erbout—my er-gittin' ter be er natur's docter. I war er-workin' 'roun' on the mount'in er-huntin' fur ar-rer-root, 'n' I hearn a voice, as plain as I ar' hyarin' them horses' foots, er-sayin': 'Dr. Zeke, give natur' what natur'

calls fur,' and I went right ter stud'in', day in an' day out, what hit meant. But one day Mistis Toomer, 'roun' th' mount'in, she come ter me an' says, says she, 'Dr. Zeke, the baby ar' mortul' sick an' ar' continnerwally er-cryin' fur raw 'taters an' fried greens.'"

"And you gave them to her?"

"Quicker ner lightnin' hit come ter me what war meant 'bout natur' callin', an' I says, says I: 'Mahaly Toomer, ef the baby ar' mortul' sick an' ar' er-continnerwally cryin' fur raw 'taters an' fried greens, give her raw 'taters an' fried greens'; an' with thet I warks off an' leaves 'er stan'in' in th' road like one seized uv er sperrit. Mahaly told our folks nex' day thet she laid out thet Dr. Zeke hed done gone plum crazy, but bimeby, er-knowin' my ways, she up an' give the chile hits 'taters an' fried greens.'"

"Death was instantaneous, I suppose?"

"Death! Why, ther chile ar' ter-day ther out-str'ppinest boy in Rabun County."

The stranger laughed.

"Well, that was wonderful indeed. But Doctor, seriously, what would you do if nature should call for something out of season?"

Dr. Zeke pursed up his lips, and, looking out across the mountains, scratched his chin.

"Natur'," he said presently, "hain't goin' ter call fur thet which natur' hain't got—thet is, ginerally. But hit do sometime so happen thet way."

"Then comes practice by substitute." The stranger passed the reins while he went down into a leather case for cigars.

"No," said the doctor; "hit won't work thet er way. Now thar war Sis' Debory Jinkins, which word come es how she war seized with er longin' fur watermillion, when water-millions war long gone; an' I, knowin' thet gourds war somewhat arter th' make er th' watermillion,—sorter half kin on one side, anyhow,—had um fetch er green gourd, an' we put hit down Sis' Debory's throat, her ma er-holdin' her, fur she did kick pow'ful, bein' natur'ly of a contrerry natur' an' havin' no longin' fur thet end of the watermillion family. We put it down her throat—"

"I suppose it satisfied her longing for watermelon."

"Yes, hit satisfied her longin' fur most ev'ythin' fur erwhile; leastways, she never said nuthin' more erbout watermillions; but Sis' Debory come nigh under death with colic afo' mornin', an' sence thet time I hain't hed faith in substytoots. Ef natur' calls fur what natur' hain't got, I argy thet hit ain't Dr. Zeke thet's ter blame; an' I ginerally waits on tel natur' calls fur suthin' ter hand."

Something like five miles had been covered during the exposition of the Sykes theory

of medical practice, when Ezekiel suddenly changed the subject.

"Stranger, yuh ever hyar er th' Widder Martin — Sallie Boler thet war, up een Red Crick settlement?" he asked.

"Yes, indeed. Nice woman she is, too." The stranger spoke without hesitation. Ezekiel was silent for a full minute; then, unable to contain the secret any longer, he continued:

"Well, hit's 'bleeged ter come out. I'm er-courtin' th' same."

"Indeed! Bully boy, and good luck to you! Is she pretty well fixed?"

"Fixed?"

"Got any land — money?"

"Er whole county, an' no eend er stock."

"Go in, old fellow, and win!" said his companion impressively. "And you are really courting her?"

"Thet's what er said. Ever meet her, stranger?"

"Oh, yes. The widow and I are good friends."

"Yuh don't say!"

"We are, indeed."

"Then, stranger, yuh stop erlong 'ith us ter-night. She 'll be pow'ful glad ter see 'er ole friend, an' anybody thet Ezekiel Sykes brings 'll be welcome ter the bes'."

For a full hour and a half Ezekiel held forth upon the subject that was consuming him, but when at length they reached a little branch he called "Whoa!" and the willing horses came to a halt.

"Stranger," said he, "will you hole up er minute tell I spruce er bit?"

"Why, certainly."

Ezekiel alighted from the buggy, and, washing his feet in the stream, wiped them upon the grass and drew on his boots. After this he stuck the little glass in a tree again, put on his coat, and producing a faded red cravat proceeded to tie it about his neck. Then he combed his well-oiled locks with his fingers.

"Thet 'll do fur th' widder," he said as he climbed back into the buggy.

The two journeyed along pleasantly until the summit of the ridge was reached and the opposite valley lay spread before them. Here the stranger, after a few minutes' reflection, said, his eyes twinkling:

"Dr. Sykes, perhaps I ought to have mentioned it before, but the fact is I married Widow Martin myself two weeks ago."

Ezekiel looked at him blankly for a full minute, then reached out and caught the lines, and with a slow steady pull brought the horses to a standstill. The stranger's face was as calm and impassive as a June sky.

"Yuh don't say!" he exclaimed in a hoarse whisper.

"Fact. But don't turn back on that account. Any friend of mine will be welcome to Sal. Besides, she wants to see you, for I have heard her say so."

Ezekiel still surveyed him piteously. Then he slowly reached down and drew off first one and then the other boot. His cravat was returned to his pocket. Springing to the ground, he caught the line nearest him.

"Stranger," he said, "Widder Martin's new husbun's er-goin' ter get whupped! Oh, yuh need n' laugh!"

"Sykes," said his late companion, wiping the tears from his eyes and still shaking, "let go that line."

"I 'm th' bes' man in Rabun County," said Ezekiel, dancing in the road. "Come down, come down!"

"You're the biggest fool!"

Ezekiel was fairly boiling with rage.

"Light, light!" he yelled. Then as the stranger made no motion to comply, Ezekiel began to kick the nearest horse in the stomach with all his might, and that animal responded by rearing and plunging violently. The stranger "lit." Unfortunately for Ezekiel, he was caught in the act of pulling off his coat. He was a doomed man from the outset. For about three minutes there was an animated spectacle in the road, and then Ezekiel fled from the spot, as was perfectly proper, since he could have accomplished nothing desirable by remaining, and the stranger was at white heat. Kicking the horse had upset his temper completely.

"Confound the fellow!" he said; "I've a great mind to carry off his boots and coat."

But he did not, and nature's physician regained them when the coasts were cleared, and, bleeding and dazed, took the back track. At the little branch he stuck his glass in the tree again and began an examination of himself. One eye was nearly closed, his lip was cut, and his nose was swollen. Minor injuries helped to make him the unhappiest of mortals. Long time he studied himself in silence. Presently he said, a great tear oozing from the blackened eye:

"Ef 'e had n' er-got een thet ar fust sub-binder unner thet ear, afo' I got out'n th' coat, Widder Martin's new husbun 'u'd er-be'n in er worser fix 'n thet." He checked the tears and examined himself critically. Finally he said more calmly: "Hit war done complete an' no mistake."

As he slowly and painfully resumed his journey homeward he added: "'Ef her life war ter come round ter be lived ergin, she'd be Mistis Ezekyel Sykes down een Raccoon Holler, she would!" He shook his head pitifully: "O Sal, Sal; my heart ar' plum broke!"

111.

"LAH sakes, Ezekiel, what ails yuh, boy?" Again the shadow of the great mountain was deepening over the little cottage, when, foot-sore, bruised, weary, and disconsolate, Ezekiel Sykes dragged himself in through the open gate and dropped his boots upon the floor of the porch, his coat beside them. His mother's salutation roused him, and he raised a quizzical face to hers—a face which surely only a mother could have recognized. A faint smile flittered among the few clearings upon it—a dim ghost of his old smile.

"Be'n ter th' yan side of the mount'in, Ma!" He sank upon the top step and rested his chin upon his hand. "An' I hain't er-torkin' much erbout hit ter-night."

The woman checked her second exclamation. She was used to the young man's moods; and, besides, the results of the fist and skull fights were perfectly familiar to her in that rough country of green whisky and exciting elections. But for Ezekiel to come home in these piping days of peace bearing evidences of having figured on the losing side of a scrimmage was altogether novel.

"Ezekiel," she said, "tell yuh ma how hit come erbout?" Ezekiel ejected a stream of tobacco-juice from between his swollen lips, and wiped them gently with the back of his hand.

"Hit all come uv one sub-binder unner thet ar ear; hit war lammed when I war er-pullin' out er my coat an' my arm hit war stickin' ter the sleeve. Ef th' mount'in hitse'f hed er-fell thar, hit 'u'd er-be'n erbout ther size er thet ar lick. But, Ma, cook suthin' quick. Hit 's be'n nigh onter two mortul days sence I eat. I did n't want nobody er-laughin' at Ezekiel Sykes, an' so I come honggry all ther way back."

"Why, sakes erlive, ther boy mus' be er-perishin'. Set right thar, Ezekiel, an' don't yuh move er peg tell I git er pone er bread an' er pot er coffee."

The good woman bustled off and disappeared. While this brief scene was enacting, Dorinda stood within the shadows of her little room, her fingers clasped and eyes set eagerly upon the pair. Her mother's form had but disappeared in the kitchen when she glided out and sank upon her knees at the young man's side, her hand upon his shoulder.

"O Zeke, Zeke!" she whispered, "lemme do suthin' fur yuh! Are yuh hurted bad, Zeke?"

He gazed at her with his one open eye a full minute before replying. The look was so comical, so utterly foreign to him, so pathetic withal, that she finally threw her head back

and laughed until the valley seemed to swarm with silvery echoes. Ezekiel blinked wisely at her.

"D'rindy," he said, "yuh better laugh fur two; I ain' ekil ter any ter-night."

And so she did. Her emotion, which was deeper than the occasion, ran off in laughter that approached the hysterical.

"O Zeke!" she gasped, "s'posen thet ar pictur' man hed er-took yer ter-day!" Zeke's queer smile came out again, gamboled pitifully in the small clearings of his countenance, and went back with a suddenness that was grotesque. The girl was still holding her sides, but presently she wiped her eyes with her apron.

"O Zeke," she said, "I'm so sorry! What kin I do fur yuh?"

"Natur' is er-callin' fur suthin' ter go in-nards," he declared oracularly, "sech es Ma gits up; an' I reck'n as how natur' ought ter be callin' fur suthin' ter go outside. Git some water, D'rindy. Ef hit had n'er be'n fur thet ar leadin' sub-binder—" But the girl had glided into her room and caught up her crock. She sped out to the little rivulet, sparkling icy cold from the spring. Presently she came back with it full and placed it on the step.

"Now, Zeke," she said, "yuh jes set down thar on th' nex' step an' lay yuh head in my lap—so! Now keep still." Her plump little hand cupped water against the swollen places of his head, and as she bathed them thus the young man, soothed and quieted, ever and anon gazed up into her violet eyes and flushed face.

"I declar' ter goodness, D'rindy," he said, seeking for some way to express his gratitude, "yuh han' 's es sof' es er moss-patch, an' yuh es putty es th' sunset on th' mount'in."

"Shet yer jaw, Zeke; yer pokin' fun at me! An' yuh eyes can' see ter-night, nuther."

Still her heart beat fast and strong. It was the first compliment a man had ever paid to her looks. She might live out her lonely life unblessed here in the valley, and the horizon of her daily existence be the long blue peaks and her simple household duties; but the memory of the words that she had heard would dwell with her always. Her soul could thrive upon a crust that other women would spurn.

Silence fell upon them, the gliding water lapping the bruised face and lullabying the perturbed spirit, the soft hand of the girl weaving a spell for the wounded warrior. Long time they sat thus, and ever and anon his single eye sought the face above it. Something of wonder was stirring within him. Hers was a beautiful face; he had never known it before. He had seen it a thousand times; how was it that the fact had escaped

him? "She ar' putty as ther sunset on ther mount'in," he assented dreamily, indorsing his own compliment; "an' er dern sight puttier." The remaining orb blinked at her dreamily and closed beside its mate.

"What yuh sayin', Zeke?"

"I war er-sayin' er dern sight puttier; thet's what I war er-sayin'," he answered faintly.

"Who?" she asked softly. Then presently she added, "Sal Boler?" One of Ezekiel's eyes opened wide; the other struggled in vain beneath its thick blue curtain.

"Who said Sal Boler?"

She turned her face away and fixed her gaze upon the distant peaks. Her reply was just audible and full of pathos:

"Yuh went thar, Zeke. I did n' mean ter hyah hit, but th' parson talked so loud. War she trooly a widder, Zeke, an'—an'—did she trooly wantar come back an' be—Mistis Ezekiel Sykes down een Raccoon Holler?"

It was out at last; and the sentence seemed to end almost in a moan. One tear fell down from above him, but it splashed only the little hand that soothed his wounds.

"D'rindy," he answered, after a long silence, "I had er mine ter keep my jaws shet, but hit ain't no use now. An' I don't care noway. D'rindy, Sal Boler hes done j'ined ter er city feller, an' hit war him what shet thet ar eye! Hit makes yuh jump, an' hit mademe jump too, at fust. D'rindy, ef any man hed er-said ter me yestiddy mornin' when I went outer thet gate, 'Ezekiel Sykes, Sal Boler is j'ined ter er city feller, an' th' city feller is goin' ter lick yuh afo' night,' I 'd er-said he war er dinged fool ef no worse, an' ter es face. But them ar is ther two things hes come erbout. An' I mus' say, thet while I don't think no better er Sal Boler, but on the contrarywise do set her down fur er huzzy, hit mus' be 'lowed thet thar es suthin' more in city fellers 'n I most ginerally have let on; only hit ain't er fair fight ter open up 'ith sub-binders on the ear when er man is hung een his coat-sleeve."

"An' did yuh see 'er, Zeke?"

"No. I seed whar she war said ter be er-livin', an' then me an' the city feller thet had gimme a lift got ter jawin', an' hit come out thet Sal Boler was done j'ined unter him two weeks or more. One word started ernuther," he added, "an' ernuther started ther sub-binder."

Ezekiel was expanding under the humane treatment, and could afford even to indulge in pleasantry.

Mrs. Sykes dissipated the charm that had been woven about them by appearing suddenly with a great quantity, though limited variety, of the physic that "natur'" had called for in behalf of Ezekiel, and to which the pa-

tient took kindly, not to say greedily. Dorinda watched him eat with a vague unrest in her heart. There is nothing at any time attractive to a woman in the sight of a hungry man at his meals. But when Ezekiel went in to lie down upon his mother's bed, as he used to when a boy when tired or troubled,—and was he not still her boy?—the deserted girl stood up gazing on the mountains veiled in their violet mists into which the blue sky of the ending day was melting, their depths shot with roseate rays. The scene was miniaturized in her shadowy eyes, where a softer light was beaming.

"He's come back free, an' he said my han' war soft es er patch er moss, an' I war es putty es the sunset on th' mount'ins: he said hit!" Her eyelids drooped over their orbs, and her chin sunk upon her breast. Then, starting as from a dream, she followed into the house.

THAT night, when Dorinda lay dreaming in the littleshed-room so full of her own life, there came down the valley a deep, booming, roaring volume of sound, and the house trembled responsive to its vibrations. Nearer it approached, and her room was filled with the fierce light of an electric flash which seemed to explode there. Blinded, stunned, terrified, she groped towards the door and lifted the latch. She was almost thrown down by the storm that burst in upon her. The air seemed full of timber, stones, and flying drift, and the thunder was as the thunder of the waters that come down at Tallulah when the river is full. Her voice when she called was beaten back as feather in her throat. The timbers of the little room seemed about to fly apart. Gasping with fear, unable to close the door against the mighty blast, she gave herself up for lost. With her limbs benumbed, she tottered and fell. There, as she lay awaiting death, a man came and in the screaming fury of the storm lifted her in his arms. There was a moment in which the deluge splashed her face and the next instant she was drawn into the warm kitchen. She saw by the tremulous light of the mysterious flame the half-blackened face of Ezekiel bent above her, and faintly as one calling afar off heard his mother's voice:

"He holds th' thunder een es han'
An' rides upon th' storm,"

just as the parson used to line it out at Zebulon. Then came darkness.

When Dorinda gained consciousness her adopted mother was bathing her face; they were alone, Ezekiel having withdrawn at her command. The storm was now at its height, and the room was full of the sudden and fear-

ful blazes. Dorinda struggled to her feet again. Her lips moved rapidly, but all sound was lost in the din of the battle waged about them. Suddenly she broke from the elder woman's clasp and rushed to the porch. For an instant her mother thought that, crazed with fear, she had thrown herself into the storm, but in the next back came the girl through the furious elements, drenched, and with her hair blown wildly over her half-nude shoulders. The lightning trembled over and seemed to lick her form from head to foot, and by the sheen of its liquid, wavy flame she saw that the girl's hand clinched the little photograph of Ezekiel, torn from its frame of mica, while her face in its beautiful triumph seemed almost glorified. The secret was written there.

"D'rindy, D'rindy, child!" she cried. "Why hain't yuh tole me afo'?"

The words, screamed as they were in the night from the heart of the woman, did not reach the girl, who covered up the little picture in her chilled bosom, and crouched shivering by the smoldering fire. Her companion gazed upon her piteously, then kneeled beside her, and, pointing upward, moved her lips. Dorinda understood, and followed her example. Still raged the storm; such an one had never before burst upon Raccoon Hollow. Suddenly there was a noise as though the mountain itself had been riven asunder, and the house shook until the crockery danced upon the shelves. Then all grew still. Rising to her feet, the elder woman drew the shivering girl to the bed where the old man, deaf to the storm and oblivious of life, slept the sleep of second childhood, wrapped a blanket about her and thrust her under cover.

"Ma," she moaned, and the word sounded as it did when on that sad day years ago the kind-hearted woman received her as a charge — "Ma, kiss me onct, please"; just the appeal made to the dead that lay unresponsive to its frightened offspring. It was the first time that she had used it since. With tears streaming from her eyes, the woman bent and kissed her thrice, and her lips when she rose were wet with the tears of the girl.

"An' him er-lovin' nobody but ole Tom Boler's gal," she said. "Hit's more 'n I kin make out."

IV.

IN the morning, when Ezekiel looked forth from the doorway, an appalling spectacle met his gaze. The mountain had actually split asunder, and one half had sunk far down below the other. So sharply was the line drawn that a great pine, yielding one half its trunk to the departed, upreared the other with the firmer rock, its white riven heart blazing the

hillside like a monument. Pale with astonishment, Ezekiel gazed long upon the scene, but there was something yet more appalling reserved for him — not a stalk of corn was left in the valley. His mother came to him and was silent too in awe at the desolation apparent and the change in the familiar old mountain. "All gone, Ma, all gone!" he groaned. The lips of the pale woman trembled. She was wont to say that her faith was like the mountain, but was not the mountain split at last? Her hand rested upon him as it had, oh so many, many times when trouble oppressed them.

"Th' Lord 'll pervide, Ezekiel. He kep' us in the night, an' he kin keep us in th' day."

"I be'n hyarin' that, Ma, all these years, an' now look! Poorer 'n' poorer year een an' year out. Es fur me, I war whupped when Pa got inter troubl' 'ith the law an' we had ter sell all ter pay out. Th' Lord maybe did pervide, but hit's be'n mighty hard livin' sence."

"Hush, Ezekiel!" the woman whispered. "Hit's blasphemey! Leave hit erlone; th' righteous 'll never beg bread; leave hit erlone. Th' han' th' kin split mount'ins kin pervide fur hits own."

The light had come back to the weary face, and it was almost beautiful in its new faith as she turned humbly and went about her household duties. But Dorinda, watching her, thought that her step was feebler than she had ever seen it.

"Aun' Betsey," she said, putting her arm upon her shoulder, "don't yuh give up."

"Give up? No, deary; I ain't er-givin' up. But ef ther Lord hed er-tuck us las' night, I would n' er-listed er finger ter hender him. Hit warn't his will, D'rindy, an' I 'm willin' ter wait."

It was a gloomy day for Raccoon Hollow. Ezekiel, under the lingering pains of his old misfortune and the new, wandered about disconsolate, and when morning dawned again the last of the Sykes' meal went into pones of bread.

The mystery of the mountain spread far and near. The day upon which the fortunes of the Sykes family seemed at their lowest ebb was signalized by the arrival of an excursion party from The Falls. Ten or twelve ladies and gentlemen on horseback and in vehicles rode over to see the wonder, bringing a well-ordered lunch. They chattered over the catastrophe, climbed the mountain, and presently the ladies rendezvoused at the little house. Here the lunch was spread, and Dorinda brought water from the spring and rendered many little kindly services. After lunch the party swarmed unceremoniously over the premises, including Dorinda's little room, which delighted them as

much, probably, as the mountain interested. Especial attention was devoted by the ladies to the delicate traceries upon the mica frame, to which Ezekiel's photograph had been carefully restored. A handsome, grave young gentleman was asked to examine it. He did so, and turning to Dorinda, whose cheeks flushed, perhaps by the praise already bestowed, asked:

"Where did that mica come from?"

"Well, now, is n't that just like Captain Moore!" exclaimed one of the ladies. "We were not talking about the mica, sir, but the tracings."

He smiled. "The tracings have great merit," he said; "but there is more money in mica that will split into such large clear sheets than in all the art that can be put upon it. You say that you found it near here?" This to Dorinda.

"Yes, sir."

"And will you go with me to see it in the morning, if I return?"

"Yes, sir, ef yuh wants me, an' th' mountain hain't sunk 'ith hit." The party began to prepare for departure. Presently there was a brief consultation among the gentlemen; then as some were galloping away one of them approached Mrs. Sykes and poured a handful of small silver into her hand. "For your kind attentions," he said. Before she comprehended he mounted and galloped away, leaving her speechless with surprise and emotion. Ezekiel came out of the wood where he had concealed his disfigurement all day, and there on the porch he and Dorinda found her sitting. Tears were running down her cheeks, and she made no effort to restrain them. She held out the hand blessed with so much silver.

"Ezekiel," she said, and then her eyes lifted upward and finished the sentence. He comprehended.

"Yes, Ma," he said gently, "yuh ar' right an' I ar' wrong, es ar' most commonly true." But the girl put her arms around her and kissed the wrinkled cheeks in silence.

Early the next day sensitive Ezekiel took to shelter again, for Captain Moore kept his promise. Ezekiel was hidden on the mountain, from which he beheld the gentleman and Dorinda pick their way across the rift to the far side. It was a difficult journey, and though the girl was as agile as a deer, Ezekiel noticed with a queer pain at his heart that the stranger insisted upon extending his hand to her every time occasion offered, and that it was always accepted.

"Dad blast th' feller!" he said: "he 'd better git her ter help him, stidder him er-helpin' her."

The girl was in a particularly merry mood. Did she suspect that the single eye of the

disfigured doctor was upon her? She was a woman, and the curious can argue the conclusion. Her laughter rang out across the rift, and he found himself angry and uncomfortable generally. Heigh-ho, Ezekiel Sykes! You cannot understand nature after all, can you? See that leap she just made, her hair flying and poke-bonnet waving. How beautifully done! The gentleman does not follow — ah, but he does, and she beams upon his success. Look out above your bowlder, Ezekiel, with your one capable eye, and mutter "Dad blast him!" as much as you please; they are not concerned about you.

The mica was found more than ever uncovered by the slide; a wonderful seam it was, hemmed in by quartz. The gentleman said little, but was evidently deeply interested. Finally he ascertained, by casual questions, that the ownership was vested in Mrs. Sykes. But the next day he came again, and again the girl accompanied him. He was trying to follow the vein. And the history of one day was as the history of its predecessor, even down to Ezekiel.

But at last, standing over the mica, the captain and the girl held a long and earnest conversation. Ezekiel saw her give him her hand impulsively, and they came back, her face flushed, her eyes sparkling. The truth, as it appeared to Ezekiel, was unmistakable, and he was full of rage when he saw the stranger depart and Dorinda wave her bonnet in response to a wave of his hat. But alas for Ezekiel; there was no time for questions. A second large party had come up from 'The Falls and swarmed over the place, and back into the friendly shadows of the mountain the young man carried his poulticed ear and picturesque scars. When this party left, the hand of the trustful and hospitable old lady was again blessed with coin.

So ran the summer away; but ere it had ended, the little home, or "Aunt Betsey's," as it had come to be known, became a regular rendezvous for visitors, who got there midday meals, bought strings of bead-corn, posies of gay flowers, and queer bits of quartz and mica with delicate traceries upon them. The cow and chickens had come back; the pigs, too, returned; yes, and the bee-hives. And everything about the yard straightened up, as with new life, from their leaning attitudes. From the rafters of the kitchen were hung yarns and provisions and shoes for the long winter, and scores of other articles for home use; and on the shelves were bolts of cloth, canned goods, and all the necessities of life. Dorinda's gown was as nice as anybody's. The smile of God seemed to rest upon Raccoon Hollow and the riven mountain.

LOOK OUT ABOVE YOUR BOWLDER, EZEKIEL.

V.

How was it with Ezekiel? The clouds still hung low. The intuition of the young woman had placed her in possession of his secret before he knew that he had one, and with the perversity of her sex she turned the tables upon him. Her smiles were distributed among the tourists, and she learned to give keen answers to their good-humored banterings. Often he had tried to tell her of his misery, but with the training she had been receiving from the beaux and coquettes, he was no match for her. One day she went to him with a great secret.

"O Zeke!" she said, "I ar' er-goin' ter tell yuh suthin'. Th' parson war erlong ter-day, an' tickled nigh under death. He do say hit's all er joke erbout Sal Boler's gittin' jined to thet ar city feller, which war er drummer an' er-foolin' yuh. Th' parson say es how hit's all over Calliny, an' folks es er-torkin' erbout 'Zeke Sykes's los' widder.'" She held her sides, and followed up the information with a most provoking spasm of mirth. Ezekiel gasped for breath. His voice was hoarse when he spoke at last.

"Th' parson tole yuh?"

"On course. He come straight from Sal's, an' she tole 'im 'ith her own mouth. Now yuh kin go back, an' Sal kin 'be Mistis Ezekiel Sykes down een Raccoon Holler.'" There was just the faintest tremor in her voice, but Ezekiel was beyond the comprehension of fine shadings then. She had expected an outburst; there was none. The young man walked off, and the signs were unmistakable; he was crushed.

"Zeke, are yuh hurted bad sure 'nough?"

she called after him repentantly. He made no reply. When he came back later she was sitting on the steps.

"Ma," he said, "I 'm er-goin' ter Th' Falls, an' maybe I won't come back 'n er week; an' maybe hit 'll be two er 'em. They do say es how thar ar' more chance fur mount'in men in Alabam', an' I 'm er-gittin' sorter worrit down here. I 'll tork ter yuh when I 'm done torkin' ter them thet knows. Thar be some erbout Th' Falls now thet knows." He kissed her cheek, an odd caress for Ezekiel, and affected not to see her anxious look.

"Good-bye, D'rindy," he said, as he passed her on the steps. "New frien's is better 'n ole frien's." A great lump rose in the girl's throat; she could not speak. He passed through the gateway and took the road that led to The Falls, walking listlessly. She watched him for a moment, then rose and darted after him, her light step giving out scarcely a sound. If he heard, he made no sign. Presently she laid a hand upon his shoulder, and then he turned and looked down into the violet eyes, while a trembling seized him.

"Zeke," she said, a little smile quivering upon her lips, "when yuh git ter Alabam' won't yuh write er letter?"

"One writes ter yuh now, an' one es er-nough." He blurted the words out and drew from under her touch.

"O Zeke!" She looked at him with such reproach that he was half ashamed. Then she laughed, pointing her finger at him. "Zeke, I do berlieve yuh er-slippin' off ter court Sal Boler ergin." She bent almost double with the idea.

"No, I be n't," he said hoarsely.

"Yuh ar', Zeke. Yuh ar'! An' O Zeke, ef yuh be, look out fur drummers on th' road!"

He turned and strode off without a word more. She leaned her back against a tree weak with laughing, her feet thrust out in front. Presently she called him.

"Zeke!" He turned and glared back at her in silence. "Zeke Sykes," she continued, "yuh ar' er bigger fool 'n I seen this year, an' thar ar' be'n some big ones 'round hyar, th' Lord knows." Her face was flushed and she held

"Well," said Ezekiel finally, "I war er fool mos' trooly."

Two more incidents close the idyl of "Sink-in' Mount'in," as Zeke's sign-board at the fork of the roads has it. The captain's letters, spelled out with much labor, gave assurance of a sale of the mica deposit at a good price. This is one. The other is: In the closing hours of the season, Ezekiel, wandering about the hotels, met face to face the drummer

"ZEKE, TAKE ME ERLONG TER ALABAM', WON'T YUH?"

out her arms. "Zeke, take me erlong ter Alabam', won't yuh?" He came back doubting, but the arms were not lowered, and into them he walked, speechless with the change from despair to happiness. He held her a long time.

"D'rindy," he said, "an' yuh love me arter all?"

"Yes, an' afo' all—f'om th' fus time when yuh used ter tote me on yuh back over ther rocks. O Zeke! I hain't never loved nobody else in th' whole worl' but yuh." Tears crept from under the half-closed eyelids, and then there was silence as he pressed her close to him.

who had made him a jest throughout one corner of Carolina. He spoke not a word, but kept his eye on the practical joker until he had drawn his own arms entirely free of that fatal coat and dropped it to the earth. Then he slapped his thigh.

"Stranger," he said, "yuh be lookin' on Ezekiel Obadiah Sykes."

A smile came to the other's face.

"Ah!" said he. "'Natur's doctor.'"

"Th' same. Stranger, Sal Boler's husbun thet wa'n't ar' goin' ter git whupped een er-bout two minnuts." He launched forth with a mighty sub-binder, and—well, truth is truth—the next instant was knocked off his

"STUNNED, DIZZY, AND ASTOUNDED."

feet flat on his back. Rising to a sitting position, stunned, dizzy, and astounded, he gazed a moment up into the smiling face of the scientific boxer above him.

"Ezekiel," he said to himself softly, "Ezekiel Sykes, yuh be er dinged fool mos' trooly." Slowly picking up his coat, he turned his back on the assembling crowd and took the road for Raccoon Hollow. As he approached the

house after his long journey the humor of the situation overcame him, and he chuckled quietly to himself.

"Th' feller be full er sub-binders es er hog be full er fleas," he said; and then as Sinking Mountain rose before him he added, cocking one eye and coming to a standstill: "Hit ain't onpossible thet hit war th' same chap busted thet ar mount'in!"

H. S. Edwards.

THE LESSON OF THE LEAVES.

O THOU who bearest on thy thoughtful face
 The wearied calm that follows after grief,
 See how the autumn guides each loosened leaf
 To sure repose in its own sheltered place.
 Ah, not forever whirl they in the race
 Of wild forlornness round the gathered sheaf,
 Or hurrying onward in a rapture brief,
 Spin o'er the moorlands into trackless space!
 Some hollow captures each; some sheltering wall
 Arrests the wanderer on its aimless way;
 The autumn's pensive beauty needs them all,
 And winter finds them warm, though sere and gray.
 They nurse young blossoms for the spring's sweet call,
 And shield new leaflets for the burst of May.

Thomas Wentworth Higginson.

BIRD MUSIC: SONGS OF THE WESTERN MEADOW-LARK.

AMONG the song-birds of Colorado none have more completely won my interest and admiration than the meadow-lark of the West (*Sturnella neglecta*). Popularly called a lark, he is really a member—and that, too, an important one—of the American starling family, which includes the orioles, and is quite different from the starlings proper. He is the warbler *par excellence* among all the varieties of songsters that in this region have come under my notice, and I doubt if the “lark of the poets” (*Alauda arvensis*) is more than a rival of this wondrous singer of the plains. The soaring lark may have greater lung power, but hardly can his tones be more clear and liquid, or his repertory of songs contain a more varied selection. He is certainly inferior in personal beauty, and he sings as he flies, while the meadow-lark of the West makes any convenient post, rock, or tuft of grass or weeds his stage, and there sings to you by the hour.

I first saw and heard him in Estes Park, a mile and a half above tide-water, at the foot of Long’s Peak. Our camping-party had gone up from the hot, dusty plains through the picturesque cañon of the St. Vrain, and late in the afternoon we had our first view of this beautiful mountain valley, which is justly celebrated as the finest among the smaller parks of Colorado.

At break of day I sallied out to search with hook and line some of the cool retreats of the trout which I had seen near by on the previous evening.

Suddenly, as I was wending my way down the brook, up from the dewy grass with a whirl of swift wings rose the meadow-lark of the West, and, perching near by upon the green branch of a stunted pine, greeted me with this original and melodious “Good-morning”:

Nor was he content with a single greeting; a dozen at least he gave me in the same vein.

The sun, just then appearing above the

mountains at the eastern rim of the park, gave me a full view of the charming songster. In size like a robin, only having a stouter body, his back, wings, and tail were of a brownish-gray color, mottled in several shades, while circling around under his neck and across his sulphur-yellow breast lay a necklace of feathers as black as jet. As he began his songs, he gracefully turned his pretty head towards the sky, disclosing more fully the rich adornments of neck and breast, and then poured forth his liquid notes.

We often heard him during the two months which we spent in the park, but in all that time I noticed only this one song. It is more than probable that, not looking for any variety in his melodies, I heard others without ascribing them to him as their source; for during the spring and summer months the bird abounds in the high valleys of the range in this latitude, making its appearance there, however, somewhat later in the season than when it appears upon the plains below. Yet there is good reason to believe that the meadow-lark attains its highest perfection in song, and in some minute features which distinguish this variety of the species, only on the great central plains, where the atmosphere is notably free from moisture, and the natural verdure is scant and short-lived. It is possible, also, that the very dryness of the air on this high plateau may exert a decided influence upon the quality of his tones, rendering them, though low and enchanting.

However slight the technical points in which this songster may differ from the Eastern meadow-lark, the difference in song is certainly very marked, as noted by all observers since Audubon. While there is much greater variety, there is also a quality (*timbre*) in his tones which would make them seem almost out of place in an Eastern grove or meadow. They are also loud enough to be heard a long distance, even in the face of the stiff breezes which blow here during much of the time that the birds make their sojourn with us. The sweet and mellow character of flute tones, or those of the smaller kinds of wooden organ-pipes, would perhaps give a musical ear some idea of the quality of our singer’s notes; but besides this they are possessed of a wild, indescribable quality

that is in strict keeping with the nature of his haunts — mountain valleys which are rude and retired, and the treeless, half-dreary, semi-barbaric plains of the West. He is heard most frequently in the twilight, whether of morning or evening; but during pairing time his song may be heard the whole day long.

It is said by good authorities that the bird is half domestic in its habits, preferring the neighborhood of places where man has settled, and where the culture of the soil affords better sustenance. Present facts go far to support this view, for they are certainly to be found in great numbers throughout this whole region, where systems of irrigation have changed the barren plains into rich farms and gardens. But I have seen and heard them far away from the haunts of men, and we know that, before the advent of settlers, these birds frequented this whole region in as great numbers as at the present time.

As soon as the rigor of winter had given place to the warmer days of spring, the meadow-larks appeared upon the plains about my present home. At first few in numbers, no sooner had the plains donned their summer robes, and the flowers become lavishly abundant, than they appeared on every hand, and their songs were ever filling the air with melody. I have thus had ample opportunity for cultivating the acquaintance of the meadow-lark and observing his pleasant ways. I have already spoken of the variety of his songs, but not until last spring did I discover this novel feature, which few birds possess in so remarkable a degree. Having hitherto supposed that he had but the one song above given, I noticed with surprise that among perhaps six or seven birds there were several distinct melodies. Sitting upon the ridge-pole of the barn, one little fellow would every few seconds carol forth this melody:

while from the swaying top of a tuft of Mexican poppy some rival singer would make melodious answer in this pleasant strain:

I first noticed this variety in the songs of different individuals among the meadow-larks on an evening in May, when one of them came and took possession of the top of a fence-post near where I was sitting. As I was waiting in expectation of hearing the melody already familiar, he startled me with a strain so plaintive and so in keeping with the time and scene, that I at first doubted his being my friend of the early morning in Estes Park.

A careful look, however, showed me that it was none other than my meadow-lark of the West, changed only in his song.

My curiosity was at once aroused, and it occurred to me to preserve the songs which I might hear in future, together with the two already known to me, and before many minutes I had put upon paper a faithful copy of both the old and the new melody — faithful, at least, in so far as mere notes can represent tones of such purity and delightful quality. This was the "Vesper Hymn" which greeted my ear that quiet evening in May:

and it was a score of times repeated so clearly and well defined that by no possibility could I be deceived in a single note.

Lately, upon calling the attention of a friend to this song in the minor mode, she indulged in the pardonable fancy that the bird caught the inspiration of the hour, and, filled with sorrow by the fading away of the dying day, poured forth his lament in that mournful strain; but as I have often heard the same song, and others in minor keys, in the brightening morning and at midday, I fear that the meadow-lark does not indulge in sentiment, at least to any such extent as that of choosing his songs in obedience to any influence which the time and scene may exert upon him.

While surprised and delighted to find among my feathered friends the variety of songs above mentioned, I was by no means prepared for a still more interesting feature which soon came to my knowledge. One evening I was, as usual, being treated to a garden concert, where singer was answering singer, and each was apparently striving to outdo the others in the beauty of his melody. Here and there on every side I could see the long bills and slender heads quickly lifted skyward, and hear the many songs which immediately followed. I was listening with special attention to the nearest songster, who had alighted upon the fence not far away, and from heaving breast and swelling throat was pouring forth this song, which was at that time quite new to me:

I had just succeeded in imprinting the melody upon my memory, when another and also unfamiliar air attracted my notice. I supposed that some rival singer had stepped to the front, and looked up to inspect him; but only the one bird was sitting there. Half surmising that I was on the brink of a new discovery, I gave him my whole attention, and quietly followed him as he changed his perch, taking good care

not to disturb or frighten him. I was soon well rewarded in finding that the two songs had for their author and singer one and the same bird, and that occasionally he abruptly changed from the melody last given to this next one, which I was some time in catching, with certainty of having the correct pitch and intervals. Even the most distinct and well-defined warblings of birds are not so readily learned as melodies that are rendered on the piano or organ, instruments with which the writer has been somewhat familiar. Here is the second, and peculiarly quaint one, of the two melodies:

I was decidedly pleased to find this new trait in my favorite, and I afterward had the opportunity of repeatedly noticing it. I think, however, that only rarely does the meadow-lark change from one melody to another in close succession, but that, when perched for a warble, he generally sings one song, repeating it perhaps twenty or thirty times, at intervals of from ten to thirty seconds. When he changes his perch he usually takes up the same strain again; but occasionally he chooses a different melody after his short flight from one tuft of grass or weeds to another. On but few occasions have I heard a direct variation from the song which he sings when first alighting; but I have noticed this often enough to become certain that it does sometimes occur.

I have also observed that two birds, though singing the same melody, apparently in response the one to the other, sang it in different keys; and I have known a bird to choose another key in his reproduction of the same song.

Many of the songs of the meadow-lark end abruptly, as though the singer had been frightened and thereby interrupted. This feature, however, gives them a quaintness which lends a charm. This is one of the songs of such a nature:

The opportunity has been often afforded me of hearing this bird singing when I was not more than four or five feet distant. A shed of rough boards not far from the house affords a favorite perch for my pleasant little friends, and just below them, hidden from sight, I have many a time listened to their songs. In this way I have been enabled to detect some features which are not apparent at a distance. Instead of being more harsh, as are many bird notes when heard so near the singer, the quality of the tones of the meadow-lark is deep-

ened and enriched to a remarkable degree. In examining the throat of this songster one must be almost at a loss to associate tones of such strength and roundness with an organ so small and apparently fragile. As some kinds of delicate perfumes have the power of transporting one in imagination to climes where luscious fruits and gorgeous flowers abound in endless profusion, so do these tones, when heard very near at hand, suggest undiscovered beauties of sound to which no name can be given, and of which no language can convey an idea.

I found also that many of the songs end in a kind of musical gurgle, which is entirely inaudible at a distance and resembles nothing else that I have ever heard. The following melody had this gurgle appended to it, but I cannot represent it in notes:

Here it may be said that the songs given in this article by no means exhaust the repertory of the Western meadow-lark. Some I have had no opportunity of learning, and others are so interwoven with sliding notes and rapid warbles that I have as yet found it impossible to represent them accurately in musical characters, while the far greater number doubtless I have never heard.

Besides his song tones and melodies the bird has a cry of alarm and warning which has little of the pleasing character of his other notes. It consists of a sharp, loud chirp, very rapidly repeated, and there is no fear of misinterpreting its meaning. The passage given at the end of the article very well represents this cry in notes, but I know of no instrument which can reproduce it faithfully. In walking over the short buffalo-grass of the plains, and among the cactus beds which infest this whole region wherever irrigation has not destroyed them, one is suddenly startled by this musical rattle, and turning the eye in the direction of the sound, the meadow-lark will be seen skimming along in a straight line, a few feet from the ground, until he has reached a safe distance. If no attempt is made to approach him, the listener will probably be treated to a song. It may be one of the two following, which seem to be favorites with some of the singers:

The bird nests upon the ground, choosing a protected spot: it may be a bunch of weeds, or, if upon the open plains, it often selects a clump of sage-brush or a bed of cactus. If the former is chosen, a convenient opening is made

well within the clump, and there the nest is built. If the cactus bed is preferred, the meadow-lark hollows out a little place in the ground, lines it with soft and curly buffalo-grass, and then builds over it a little canopy, pulling down the longer blades which grow even among the thick-set lobes of prickly-pear upon the uplands, and weaving them together until a small, conical covering is made, having in one side of it a round opening to serve for a door. The location of the nest is such as to afford protection from the tramping hoofs of

cattle-herds that feed upon the plains, and which carefully avoid treading upon the long, sharp spines of the cactus. There the bird rears one, and sometimes two, broods of young, which are ready for self-sustenance and flight in July.

In August, when the mating season is ended, the songs of the meadow-lark of the West are heard more rarely, and then only in the early morning. In October the bird leaves this latitude, to pass the winter months in the warmer climes of New Mexico.

Charles N. Allen.

A RAINBOW STUDY.

BEHOLD the rainbow like a brilliant scroll
Of colors sevenfold,
From heaven's high dome unrolled!
Lift up thine eyes, lift up the adoring soul,
And read God's writing ere it passes by.
Fleet clouds of amethyst
Swim in a golden mist,
Hidden in dripping branches are the birds,
But for a moment gloriously gleams,
Through flying raindrops, bursting beams,
The legend of the sky—
Seven colors and seven words!

The dim, cold violet
Upon the outer margin set
Is sign of the veiled mystery of *pain*;
First bitter knowledge when young life is sweet,
And sun-bright hills seem near to eager feet.
And as the heavy purple overflows
The paler color, so the wayside grows
To midnight gloom when *sorrow* stoops to
smite
And rend the heart's delight.
A path of thorns, but oh! no other way
Leads to the rosy fields of upper day.

But see! how soft and fair
The tender flower-like blue
Shines tremulously through
The broad, dark purple border of despair.
Rejoice! for out of anguish blossoms *hope*!
Again the brilliant, vivid green
Against the line of blue is seen,
Earth's color painted on the skies.
So, bringing strength to cope
With woes that in perpetual tide arise,
Life-giving *faith* descends,
And though beneath the storm the pilgrim
bends,
His brow is bathed in dawn of paradise.

Oh, read in haste! the rain-cloud far has blown,
Brighter and broader are the sun-waves grown,

And the delirious birds
Their wild, wet wings in burning beams have
dipped.

Interpret from the shining manuscript
The seven illumined words.

Warm, amber yellow in rich waves
The edge of emerald verdure laves,
Symbol of *joy*—when faith grows deep
And full and strong; when even death's sleep
Has lost its gloom, and eyes that weep
See starry splendors through the tears.
The blazing orange hue
Is *triumph's* own imperial sign,
The victory pure and true
Which falls on sunset years,
When slow unfold the gates divine—
When all the storms are spent, and lonely ways
Grow beautiful in warm, benignant praise.

Now in a radiant flush of crimson fire
The rainbow is caught up to heaven!
Behold the dearest symbol of the seven.
When at the long day's close,
Through pain and sorrow dire,
The loyal soul has won its true repose,
When hope and trust have blossomed into joy,
And victory comes at last without alloy,
Then in celestial *love*
Enfolded, borne as in a flame above,
Serene in homeward flight,
The spirit soars and vanishes in light.

The green sod sparkles with the fleeting
shower,
Fresh odors pant from every breathing flower,
The sky effulgent glows!
What though the purple violet
Upon the grassy mound is wet
With dew of fond regret;
The rainbow reached from earth to heaven,
And the last color of the seven
Was love's transcendent rose.

Frances L. Mace.

ABRAHAM LINCOLN: A HISTORY.*

PLANS OF CAMPAIGN.

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

ABOUT the 1st of December, 1861, Mr. Lincoln, who saw more clearly than McClellan, then General-in-Chief, the urgent necessity for some movement of the army, suggested to him a plan of campaign which, afterward much debated and discussed and finally rejected, is now seen to have been eminently wise and sagacious. He made a brief autograph memorandum of his plan, which he handed to McClellan, who kept it for ten days and returned it to Mr. Lincoln, with a hurried memorandum in pencil, showing that it made little impression on his mind. The memorandum and answer are so illustrative of the two men that we give them here in full, copied from the original manuscript:

If it were determined to make a forward movement of the Army of the Potomac, without waiting further increase of numbers, or better drill and discipline, how long would it require to actually get in motion? [Answer, in pencil: If bridge-trains ready by December 15th — probably 25th.]

After leaving all that would be necessary, how many troops could join the movement from south-west of the river? [In pencil, 71,000.]

How many from north-east of it? [In pencil, 33,000.]

Suppose then that of those south-west of the river [in pencil, 50,000] move forward and menace the enemy at Centreville? The remainder of the movable force on that side move rapidly to the crossing of the Occoquan by the road from Alexandria towards Richmond; there to be joined by the whole movable force from north-east of the river, having landed from the Potomac just below the mouth of the Occoquan, move by land up the south side of that stream, to the crossing-point named; then the whole move together, by the road thence to Brentville, and beyond, to the railroad just south of its crossing of Broad Run, a strong detachment of cavalry having gone rapidly ahead to destroy the railroad bridges south and north of the point.

If the crossing of the Occoquan by those from above be resisted, those landing from the Potomac below to take the resisting force of the enemy in rear; or, if the landing from the Potomac be resisted, those crossing the Occoquan from above to take that resisting force in rear. Both points will probably not be successfully resisted at the same time. The force in front of Centreville, if pressed too hardly, should fight back slowly into the intrenchments behind them. Armed vessels and transports should remain at the Potomac landing to cover a possible retreat.†

General McClellan returned the memorandum with this reply:

I inclose the paper you left with me, filled as you requested. In arriving at the numbers given, I have left the minimum number in garrison and observation.

Information received recently leads me to believe that the enemy could meet us in front with equal forces nearly, and I have now my mind actively turned towards another plan of campaign that I do not think at all anticipated by the enemy, nor by many of our own people.‡

The general's information was, as usual, erroneous. Johnston reports his "effective total" at this time as about 47,000 men — less than one-third what McClellan imagined it. Lincoln, however, did not insist upon knowing what the general's "other plan" was; nor did he press further upon his attention the suggestion that had been so scantily considered and so curtly dismissed. But as the weeks went by in inaction, his thoughts naturally dwelt upon the opportunities afforded by an attack on the enemy's right, and the project took more and more definite shape in his mind.

Congress convened on the 2d of December, and one of its earliest subjects of discussion was the battle of Ball's Bluff. Roscoe Conkling in the House of Representatives, and Zachariah Chandler in the Senate, brought forward resolutions for the appointment of committees to investigate and determine the responsibility for that disaster; but on motion of Grimes the Senate chose to order a permanent joint committee of three senators and four representatives to inquire into the conduct of the war. This action was unanimously agreed to by the House, and the committee was appointed, consisting of senators Wade, Chandler, and Johnson, and of representatives Gooch, Covode, Julian, and Odell. This committee, known as the Committee on the Conduct of the War, was for four years one of the most important agencies in the country. It assumed, and was sustained by Congress in assuming, a great range of prerogative. It became a stern and zealous censor of both the army and the government; it called soldiers and

† Lincoln to McClellan, autograph MS.

statesmen before it and questioned them like refractory school-boys. It claimed to speak for the loyal people of the United States, and this claim generally met with the sympathy and support of a majority of the people's representatives in Congress assembled. It was often hasty and unjust in its judgment, but always earnest, patriotic, and honest; it was assailed with furious denunciation and defended with headlong and indiscriminating eulogy; and on the whole it must be said to have merited more praise than blame.

Even before this committee was appointed, as we have seen, senators Chandler and Wade, representing the more ardent and eager spirits in Congress, had repeatedly pressed upon the Government the necessity of employing the Army of the Potomac in active operations; and now that they felt themselves formally intrusted with a mandate from the people to that effect, were still more urgent and persistent. General McClellan and his immediate following treated the committee with something like contempt. But the President, with his larger comprehension of popular forces, knew that he must take into account an agency of such importance; and though he steadily defended General McClellan, and his deliberateness of preparation, before the committee, he constantly assured him in private that not a moment ought to be lost in getting himself in readiness for a forward movement. A free people, accustomed to considering public affairs as their own, can stand reverses and disappointments; they are capable of making great exertions and great sacrifices: the one thing that they cannot endure is inaction on the part of their rulers; the one thing that they insist upon is to see some result of their exertions and sacrifices. December was the fifth month that General McClellan had been in command of the greatest army ever brought together on this continent. It was impossible to convince the country that a longer period of preparation was necessary before this army could be led against one inferior in numbers, and not superior in discipline or equipment. As a matter of fact, the country did not believe the rebel army to be equal to the army of the Union in any of these particulars. It did not share the strange delusion of General McClellan and his staff in regard to the numbers of his adversary, and the common sense of the people was nearer right in its judgment than the computations of the general and his inefficient secret service. McClellan reported to the Secretary of War that Johnston's army, at the end of October, numbered 150,000, and that he would therefore require, to make an advance movement with the Army of the Potomac, a force of

240,000. Johnston's report of that date shows an effective total of 41,000 men! It was useless to try to convince General McClellan of the impossibility of such a concentration of troops in front of him; he simply added together the aggregates furnished by the guesses of his spies and implicitly believed the monstrous sum. It is worthy of notice that the Confederate general rarely fell into the corresponding error. At the time that McClellan was quadrupling, in his imagination, the rebel force, Johnston was estimating the army under McClellan at exactly its real strength.

Aware that his army was less than one-third as strong as the Union forces, Johnston contented himself with neutralizing the army at Washington, passing the time in drilling and disciplining his troops, which, according to his own account, were seriously in need of it. He could not account for the inactivity of the Union army. Military operations, he says, were practicable until the end of December; but he was never molested.

Our military exercises had never been interrupted. No demonstrations were made by the troops of that army, except the occasional driving in of a Confederate cavalry picket by a large mixed force. The Federal cavalry rarely ventured beyond the protection of infantry, and the ground between the two armies had been less free to it than to that of the Confederate army.

There was at no time any serious thought of attacking the Union forces in front of Washington. In the latter part of September, General Johnston had thought it possible for the Richmond government to give him such additional troops as to enable him to take the offensive, and Jefferson Davis had come to headquarters at Fairfax Court House to confer with the principals on that subject. At this conference, held on the 1st of October, it was taken for granted that no attack could be made, with any chances of success, upon the Union army in its position before Washington; but it was thought that, if enough force could be concentrated for the purpose, the Potomac might be crossed at the nearer ford, Maryland brought into rebellion, and a battle delivered in rear of Washington, where McClellan would fight at a disadvantage. Mr. Davis asked the three generals present, Johnston, Beauregard, and G. W. Smith, beginning with the last, how many troops would be required for such a movement. Smith answered "fifty thousand"; Johnston and Beauregard both said "sixty thousand"; and all agreed that they would require a large increase of ammunition and means of transportation. Mr. Davis said it was impossible to reinforce them to that extent, and the plan was dropped. It is hard to believe that during this same month of October, General McClellan, in a careful letter to

the War Department, with an army, according to his own account, of "147,695 present for duty," should have bewailed his numerical inferiority to the enemy, and begged that all other departments should be stripped of their troops and stores to enable him to make a forward movement, which he professed himself anxious to make "not later than the 25th of November," if the Government would give him men enough to meet the enemy on equal terms. This singular infatuation, difficult to understand in a man of high intelligence and physically brave, as McClellan undoubtedly was, must not be lost sight of. It furnishes the sole explanation of many things otherwise inexplicable. He rarely estimated the force immediately opposed to him at less than double its actual strength, and in his correspondence with the Government he persistently minimized his own force. This rule he applied only to the enemy in his immediate vicinity. He had no sympathy with commanders at a distance who asked for reinforcements. When Rosecrans succeeded him in western Virginia, and wanted additional troops, General McClellan was shocked at the unreasonable request. When William Tecumseh Sherman telegraphed that 75,000 men were needed to defend the Ohio line, and to make a forward movement into Kentucky, he handed the dispatch to Mr. Lincoln, who was sitting in his headquarters at the moment, with the remark, "The man is crazy." Every man sent to any other department he regarded as a sort of robbery of the Army of the Potomac.

All his demands were complied with to the full extent of the power of the Government. Not only in a material, but in a moral sense as well, the President gave him everything that he could. In addition to that mighty army, he gave him his fullest confidence and support. All through the autumn he stood by him, urging him in private to lose no time, but defending him in public against the popular impatience; and when winter came on, and the voice of Congress, nearly unanimous in demanding active operations, added its authoritative tones to the clamor of the country, the President endangered his own popularity by insisting that the general should be allowed to take his own time for an advance. In the latter part of December, McClellan, as already stated, fell seriously ill, and the enforced paralysis of the army that resulted from this illness and lasted several weeks added a keener edge to the public anxiety. The President painfully appreciated how much of justice there was in the general criticism, which he was doing all that he could to allay. He gave himself, night and day, to the study of the military situation. He read a large num-

ber of strategical works. He pored over the reports from the various departments and districts of the field of war. He held long conferences with eminent generals and admirals, and astonished them by the extent of his special knowledge and the keen intelligence of his questions. He at last convinced himself that there was no necessity for any further delay; that the army of the Potomac was as nearly ready as it ever would be to take the field against the enemy; and, feeling that he could not wait any longer, on the 10th of January, after calling at General McClellan's house and learning that the general was unable to see him, he sent for Generals McDowell and Franklin, wishing to take counsel with them in regard to the possibility of beginning active operations with the army before Washington. General McDowell has preserved an accurate report of this conference. The President said that he was in great distress; to use his own expression:

If something were not soon done, the bottom would be out of the whole affair; and if General McClellan did not want to use the army he would like to borrow it, provided he could see how it might be made to do something.

In answer to a direct question, put by the President to General McDowell, that accomplished soldier gave a frank and straightforward expression of his conviction that by an energetic movement upon both flanks of the enemy — a movement rendered entirely practicable by the superior numbers of the Union army — he could be forced from his works and compelled to accept battle on terms favorable to us. General Franklin rather favored an attack upon Richmond, by way of York River. A question arising as to the possibility of obtaining the necessary transportation, the President directed both generals to return the next evening, and in the mean time to inform themselves thoroughly as to the matter in question. They spent the following day in this duty and went the next evening to the Executive Mansion with what information they had been able to procure, and submitted a paper in which they both agreed that, in view of the time and means required to take the army to a distant base, operations could now best be undertaken from the present base substantially as proposed by McDowell. The Secretaries of State and of the Treasury, who were present, coincided in this view, and the Postmaster-General, Mr. Blair, alone opposed it. They separated to meet the next day at 3 o'clock. General Meigs, having been called into conference, concurred in the opinion that a movement from the present base was preferable; but no definite resolution was taken, as General McClellan was reported as fully

recovered from his illness, and another meeting was arranged for Monday, the 13th, at the White House, where the three members of the Cabinet already mentioned, with McDowell, Franklin, Meigs, and General McClellan himself, were present. At the request of the President, McDowell made a statement of what he and Franklin had done under Mr. Lincoln's orders, and gave his reasons for advising a movement to the front. He spoke with great courtesy and deference towards his superior officer, and made an apology for the position in which he stood. McClellan was not inclined to relieve the situation of any awkwardness there might be in it. He merely said, "coldly, if not curtly," to McDowell, "You are entitled to have any opinion you please," and made no further remark or comment. The President spoke somewhat at length on the matter, and General McClellan said very briefly "that the case was so clear a blind man could see it" and went off instinctively upon the inadequacy of his forces. The Secretary of the Treasury, whose sympathies were with that section of his party which had already lost all confidence in General McClellan, asked him point blank what he intended to do with the army, and when he intended doing it. A long silence ensued. Even if the question had been a proper one, it is doubtful whether General McClellan would have answered it; as it was, it must have required some self-control for him to have contented himself with merely evading it. He said that Buell in Kentucky must move first; and then refused to answer the question unless ordered to do so. The President asked him if he counted upon any particular time, not asking what the time was—but had he in his own mind any particular time fixed when a movement could be begun? This question was evidently put as affording a means of closing a conference which was becoming disagreeable if not dangerous. McClellan promptly answered in the affirmative, and the President rejoined, "Then I will adjourn this meeting."

It is a remarkable fact that although the plan recommended by these generals was exactly the plan suggested six weeks before by the President to McClellan, neither of them made the slightest reference to that incident. That Mr. Lincoln did not refer to a matter so close to his heart is a striking instance of his reticence and his magnanimity; that General McClellan never mentioned it would seem to show that he thought so little of the matter as to have forgotten it. He seemed also to have thought little of this conference; he makes no reference to it in his report. He says, referring to this period:

About the middle of January, upon recovering from a severe illness, I found that excessive anxiety for an immediate movement of the Army of the Potomac had taken possession of the minds of the Administration.

The last words of the phrase refer not only to the President, but to Mr. Stanton, the new Secretary of War, who began as soon as he took charge of his department to ply the commander of the army with continual incitements to activity. All suggestions of this sort, whether coming from the Government, Congress, or the press, General McClellan received with surprise and displeasure, and the resentment and vexation of his immediate friends and associates found vent in expressions of contempt for unmilitary critics, which, being reported, only increased the evil that provoked them. He at last laid before the President his plan for attacking Richmond by the lower Chesapeake, which the President disapproved, having previously convinced himself of the superior merit of the plan for a direct movement agreed upon by Generals McDowell, Franklin, and Meigs, who were ignorant of the fact that it was his. Further delay ensued, the President not being willing to accept a plan condemned by his own judgment and by the best professional opinions that he could obtain, and General McClellan being equally reluctant to adopt a plan that was not his own. The President at last, at the end of his patience, convinced that nothing would be done unless he intervened by a positive command, issued on the 27th of January his "General War Order, No. 1." He wrote it without consultation with any one, and read it to the Cabinet, not for their sanction, but for their information. The order directed

that the 22d day of February, 1862, be the day for a general movement of the land and naval forces of the United States against the insurgent forces; that especially the army at and about Fortress Monroe, the Army of the Potomac, the Army of western Virginia, the army near Munfordville, Kentucky, the army and flotilla at Cairo, and a naval force in the Gulf of Mexico, be ready to move on that day; that all other forces, both land and naval, with their respective commanders, obey existing orders for the time, and be ready to obey additional orders when duly given; that the heads of departments, and especially the Secretaries of War and of the Navy, with all their subordinates, and the General-in-Chief, with all other commanders and subordinates of land and naval forces, will severally be held to their strict and full responsibilities for prompt execution of this order.

Four days later, as a necessary result of this general summons to action, a special instruction, called "President's Special War Order, No. 1," was issued to General McClellan, commanding

that all the disposable force of the Army of the Potomac, after providing safely for the defense of Washington, be formed into an expedition for the im-

mediate object of seizing and occupying a point upon the railroad south-westward of what is known as Manassas Junction, all details to be in the discretion of the General-in-Chief, and the expedition to move before or on the 22d day of February next.

This is the President's suggestion of December 1, put at last in the form of a command.

It would not have been characteristic of General McClellan to accept such an order as final, nor of Mr. Lincoln to refuse to listen to his objections and to a full statement of his own views. The President even went so far as to give him, in the following note, dated February 3, a schedule of points on which he might base his objections and develop his views.

MY DEAR SIR: You and I have distinct and different plans for a movement of the Army of the Potomac — yours to be done by the Chesapeake, up the Rappahannock, to Urbana, and across land to the terminus of the railroad on the York River; mine to move directly to a point on the railroads south-west of Manassas.

If you will give me satisfactory answers to the following questions, I shall gladly yield my plan to yours:

First. Does not your plan involve a greatly larger expenditure of time and money than mine?

Second. Wherein is a victory more certain by your plan than mine?

Third. Wherein is a victory more valuable by your plan than mine?

Fourth. In fact, would it not be less valuable in this, that it would break no great line of the enemy's communications, while mine would?

Fifth. In case of disaster, would not a retreat be more difficult by your plan than mine?

Yours truly,

ABRAHAM LINCOLN.

This elicited from General McClellan a long letter, dated the same day, in which he dwelt with great emphasis on all the possible objections that could lie against a direct movement from Washington, and insisted with equal energy upon the advantages of a campaign by the lower Chesapeake. He rejects without argument the suggestion of an attack on both flanks of the enemy, on the ground of insufficient force, a ground that we have seen to be visionary. He says that an attack on the left flank of the enemy is impracticable on account of the length of the line, and confines his statement to a detail of the dangers and difficulties of an attack on the Confederate right by the line of the Occoquan. He insists that he will be met at every point by a determined resistance. To use his own words, he

brings out, in bold relief, the great advantage possessed by the enemy in the strong central position he occupies, with roads diverging in every direction, and a strong line of defense enabling him to remain on the defensive, with a small force on one flank, while he concentrates everything on the other for a decisive action.

Even if he succeeded in such a movement, he thought little of its results; they would be merely "the possession of the field of battle, the evacuation of the line of the upper Poto-

mac by the enemy, and the moral effect of the victory."

They would not end the war, the result he seemed to propose to himself in the one decisive battle he expected to fight somewhere. Turning to his own plan, he hopes by moving from his new base on the lower Chesapeake to accomplish this enormous and final success — to force the enemy either "to beat us in a position selected by ourselves, disperse, or pass beneath the Caudine forks." The point which he thought promised the most brilliant results was Urbana, on the lower Rappahannock; "but one march from West Point, — on the York River, at the junction of the Pamunkey and the Mattaponi, — the key of that region, and thence but two marches to Richmond." He enjoys the prospect of brilliant and rapid movements by which the rebel armies shall be cut off in detail, Richmond taken, and the rebellion brought to a close. He says finally:

My judgment as a general is clearly in favor of this project. . . . So much am I in favor of the southern line of operations, that I would prefer the move from Fortress Monroe as a base — as a certain though less brilliant movement than that from Urbana, to an attack upon Manassas.

Most of the assumptions upon which this letter was based have since proved erroneous. The enormous force which McClellan ascribed to Johnston existed only in his imagination and in the wild stories of his spies. His force was about three times that of Johnston, and was therefore not insufficient for an attack upon one flank of the enemy while the other was held in check. It is now clearly known that the determined resistance that he counted upon, if he should attack by the line of the Occoquan, would not have been made. General Johnston says that about the middle of February he was sent for in great haste to Richmond, and on arriving there was told by Jefferson Davis that the Government thought of withdrawing the army to "a less exposed position." Johnston replied that the withdrawal of the army from Centreville would be necessary before McClellan's invasion, — which was to be looked for as soon as the roads were practicable, — but thought that it might be postponed for the present. He left Richmond, however, with the understanding on his part that the army was to fall back as soon as practicable, and the moment he returned to his camp he began his preparations to retire at once from a position which both he and the Richmond government considered absolutely untenable. On the 22d of February he says: "Orders were given to the chiefs of the quartermaster's and subsistence departments to remove the military property in the

depots at Manassas Junction and its dependencies to Gordonsville as quickly as possible." The railroads were urged to work to their utmost capacity. The line of the Occoquan, against which McClellan was arguing so strenuously to the President, was substantially the route by which Johnston expected him, believing, like the thorough soldier that he was, that it would be taken, because "invasion by that route would be the most difficult to meet"; and knowing that he could not cope with the Federal army north of the Rappahannock, he was ready to retire behind that stream at the first news of McClellan's advance. Everything now indicates that if McClellan had chosen to obey the President's order and to move upon the enemy in his front in the latter part of February* or the first days of March, one of the cheapest victories ever gained by a fortunate general awaited him. He would have struck an enemy greatly inferior in strength, equipment, and discipline, in the midst of a difficult retreat already begun, encumbered by a vast accumulation of provisions and stores,† which would have become the prize of the victor. He would not have won the battle that was to end the war. That sole battle was a dream of youth and ambition; the war was not of a size to be finished by one fight. But he would have gained, at slight cost, what would have been in reality a substantial success, and would have appeared, in its effect upon public opinion and the morale of the army, an achievement of great importance. The enemy, instead of quietly retiring at his own time, would have seemed to be driven beyond the Rapidan. The clearing the Potomac of hostile camps and batteries above and below Washington, and the capture of millions of pounds of stores, would have afforded a relief to the anxious public mind that the National cause sorely needed at that time, and which General McClellan needed most of all.‡

These facts, that are now so clear to every one, were not so evident then; and although the President and the leading men in the Gov-

ernment and in Congress were strongly of the opinion that the plan favored by Mr. Lincoln and approved by McDowell, Meigs, and Franklin was the right one, it was a question of the utmost gravity whether he should force the General-in-Chief to adopt it against his obstinate protest. It would be too much to ask that any government should assume such a responsibility and risk. On the other hand, the removal of the general from the command of the Army of the Potomac would have been a measure not less serious. There was no successor ready at all his equal in accomplishments, in executive efficiency, or in popularity among the soldiers. Besides this, and in spite of his exasperating slowness, the President still entertained for him a strong feeling of personal regard. He therefore, after much deliberation and deep distress of mind, yielded his convictions, gave up his plan and adopted that of General McClellan for a movement by the lower Chesapeake. He never took a resolution which cost him more in his own feelings, and in the estimation of his supporters in Congress and in the country at large. He made no explanation of the reasons that induced this resolution; he thought it better to suffer any misrepresentation rather than to communicate his own grave misgivings to the country. The Committee on the Conduct of the War, who were profoundly grieved and displeased by this decision, made only this grim reference to it:

Your committee have no evidence, either oral or documentary, of the discussions that ensued, or of the arguments that were submitted to the consideration of the President, that led him to relinquish his own line of operations and consent to the one proposed by General McClellan, except the result of a council of war, held in February, 1862.

This council, which, the committee say, was the first ever called by McClellan, and then only at the direction of the President, was composed of twelve general officers — McDowell, Sumner, Heintzelman, Barnard, Keyes, Fitz-John Porter, Franklin, W. F. Smith, McCall, Blenker, Andrew Porter, and Naglee

* The following extract shows that General McClellan himself had some vague thought of moving at that time: "February came and on the 13th General McClellan said to me, 'In ten days I shall be in Richmond.' A little surprised at the near approach of a consummation so devoutly to be wished, I asked, 'What is your plan, General?' 'Oh,' said he, 'I mean to cross the river, attack and carry their batteries, and push on after the enemy.' 'Have you any gun-boats to aid in the attack on the batteries?' 'No, they are not needed; all I want is transportation and canal-boats, of which I have plenty that will answer.' I did not think it worth while to reply; but made a note of the date and waited. The ten days passed away; no movement, and no preparation for a movement, had been made." [From a memorandum written by Hon. S. P. Chase. Schucker's "Life of S. P. Chase," p. 446.]

† The subsistence department had collected at Manassas Junction more than three million pounds of provisions. They had also two million pounds of meat at Thoroughfare Gap, besides large herds of cattle and hogs. This accumulation was against the wish and to the great embarrassment of General Johnston. ["Johnston's Narrative," pp. 98 and 99.]

‡ Mr. William Swinton, who habitually takes sides with McClellan against the President where it is possible, says on this point: "Had Johnston stood, a battle with good prospect of success might have been delivered. But had he, as there was great likelihood he would do, and as it is now certain he would have done, fallen back from Manassas to the line of the Rapidan, his compulsory retirement would have been esteemed a positive victory to the Union arms." [Swinton, "Army of the Potomac," p. 73.]

(from Hooker's division). The first four voted against the Urbana plan; Keyes only favored it on condition that the Potomac batteries should first be reduced. The rest voted for it without conditions. This was the council afterward referred to by Stanton when he said, "We saw ten generals afraid to fight."*

This plan of campaign having been definitely adopted, Mr. Lincoln urged it forward as eagerly as if it had been his own. John Tucker, one of the Assistant Secretaries of War, was charged by the President and Mr. Stanton with the entire task of transporting the Army of the Potomac to its new base, and the utmost diligence was enjoined upon him. Quartermasters Ingalls and Hodges were assigned to assist him. We shall see that he performed the prodigious task intrusted to him in a manner not excelled by any similar feat in the annals of the world.

But in the mean while there were two things that the President was anxious to have done, and General McClellan undertook them with apparent good-will. One was to reopen the line of the Baltimore and Ohio Railroad, the other to clear out the rebel batteries that still obstructed the navigation of the Potomac. For the first, extensive preparations were made: a large body of troops was collected at Harper's Ferry; canal-boats were brought there in sufficient quantity to make a permanent bridge. General McClellan went to the place and, finding everything satisfactory for the operation, telegraphed for a large additional force of cavalry, artillery, and a division of infantry to rendezvous at once at Harper's Ferry, to cross as soon as the bridge was completed, which would be only the work of a day, and then to push on to Winchester and Strasburg. It was only on the morning of the next day, when the attempt was made to pass the canal-boats through the lift-lock, that it was discovered they were some six inches too wide to go through. The general thus discovered that his permanent bridge, so long planned, and from which so much had been expected, was impossible.† He countermanded his order for the troops; contented himself with a reconnaissance to Charleston and Martinsburg; and returned to Washington, as he says, "well satisfied with what had been accomplished." He was much surprised at finding that his satisfaction was not shared by the President. Mr. Lincoln's slow anger was thoroughly roused at this ridiculous outcome of an important enterprise, and he received the general on his return in a manner that somewhat disturbed his complacency.

McClellan went on in his leisurely way,

* J. H., Diary.

† Chase in his Diary said the expedition died of lockjaw.

preparing for a movement upon the batteries near the Occoquan, undisturbed by the increasing signs of electric perturbation at the Executive Mansion and the Capitol, which answered but faintly to the growing excitement in the North. The accumulating hostility and distrust of General McClellan,—totally unjust as it affected his loyalty and honor and his ardent desire to serve his country in the way that he thought best,—though almost entirely unknown to him, was poured upon the President, the Government, and the leading members of Congress in letters, and conversations, and newspaper leaders. Mr. Lincoln felt the injustice of much of this criticism, but he also felt powerless to meet it, unless some measures were adopted to force the general into an activity which was as necessary to his own reputation as to the national cause. The 22d of February came and passed, and the President's order to move on that day was not obeyed. McClellan's inertia prevailed over the President's anxious eagerness. On the 8th of March, Mr. Lincoln issued two more important General Orders. The first directed General McClellan to divide the Army of the Potomac into four army corps, to be commanded respectively by Generals Irvin McDowell, E. V. Sumner, S. P. Heintzelman, and E. D. Keyes; the forces to be left in front of Washington were to be placed in command of General Wadsworth. The Fifth Corps was to be formed, to be commanded by General N. P. Banks. For months this measure had been pressed upon General McClellan by the Government. An army of 150,000 men, it was admitted, could not be adequately commanded by the machinery of divisions and brigades alone. But though McClellan accepted this view in principle, he could not be brought to put it into practice. He said that he would prefer to command the army personally on its first campaign, and then select the corps commanders for their behavior in the field. The Government thought better to make the organization at once, giving the command of corps to the ranking division commanders. The fact that of the four generals chosen three had been in favor of an immediate movement against the enemy in front of Washington will of course be considered as possessing a certain significance. It is usually regarded as a grievance by the partisans of General McClellan.

The other order is of such importance that we give it entire:

PRESIDENT'S GENERAL WAR ORDER, No. 3.

EXECUTIVE MANSION,
WASHINGTON, March 8, 1862.

Ordered, That no change of the base of operations of the Army of the Potomac shall be made without

leaving in and about Washington such a force as, in the opinion of the General-in-Chief and the commanders of army corps, shall leave said city entirely secure.

That no more than two army corps (about fifty thousand troops) of said Army of the Potomac shall be moved en route for a new base of operations until the navigation of the Potomac from Washington to the Chesapeake Bay shall be freed from enemy's batteries and other obstructions, or until the President shall hereafter give express permission. That any movement as aforesaid, en route for a new base of operations, which may be ordered by the General-in-Chief, and which may be intended to move upon the Chesapeake Bay, shall begin to move upon the bay as early as the 18th of March instant, and the General-in-Chief shall be responsible that it moves as early as that day.

Ordered, That the Army and Navy coöperate in an immediate effort to capture the enemy's batteries upon the Potomac between Washington and Chesapeake Bay.

ABRAHAM LINCOLN.

L. THOMAS, *Adjutant-General*.

This order has always been subject to the severest criticism from General McClellan's partisans; but if we admit that it was proper for the President to issue any order at all, there can be no valid objection made to the substance of this one. It was indispensable that Washington should be left secure; it would have been madness to allow General McClellan to take *all* the troops to the Peninsula, leaving the Potomac obstructed by the enemy's batteries, so near the capital; and the fixing of a date beyond which the beginning of the movement should not be postponed had been shown to be necessary by the exasperating experience of the past eight months. The criticism so often made, that a general who required to have such orders as these given him should have been dismissed the service, is the most difficult of all to meet. Nobody felt so deeply as Mr. Lincoln the terrible embarrassment of having a general in command of that magnificent army who was absolutely without initiative, who answered every suggestion of advance with demands for reinforcements, who met entreaties and reproaches with unending arguments to show the superiority of the enemy and the insufficiency of his own resources, and who yet possessed in an eminent degree the enthusiastic devotion of his friends and the general confidence of the rank and file. There was so much of executive efficiency and ability about him that the President kept on, hoping to the last that if he could once "get him started" he would then handle the army well and do great things with it.

MANASSAS EVACUATED.

SUNDAY, the 9th of March, was a day of swiftly succeeding emotions at the Executive Mansion. The news of the havoc wrought by

the *Merrimac* in Hampton Roads the day before arrived in the morning, and was received with profound chagrin by the calmest spirits and with something like consternation by the more excitable. But in the afternoon astonishing tidings came to reverse the morning's depression. The first was of the timely arrival of the *Monitor*, followed shortly, on the completion of the telegraph to Fort Monroe, by the news of her battle and victory. The exultation of the Government over this providential success was changed to amazement by the receipt of intelligence that the rebel batteries on the Potomac were already abandoned, and the tale of surprises was completed by the news which came in the evening that the Confederate army had abandoned their works at Manassas, retreating southward. General McClellan was with the President and the Secretary of War when this message arrived, and he received it, as might have been expected, with incredulity, which at last gave way to stupefaction. He started at once across the river, ostensibly to verify the intelligence, and in his bewilderment and confusion issued an order that night for an immediate advance of the army upon Centreville and Manassas. In the elaborate report by which he strove, a year after the fact, to shift from himself to others the responsibility of all his errors, occurs this remarkable sentence:

The retirement of the enemy towards Richmond had been expected as the natural consequence of the movement to the Peninsula, but their adoption of this course immediately on ascertaining that such a movement was intended, while it relieved me from the results of the undue anxiety of my superiors and attested the character of the design, was unfortunate in that the then almost impassable roads between our positions and theirs deprived us of the opportunity for inflicting damage usually afforded by the withdrawal of a large army in the face of a powerful adversary.

This was the theory immediately adopted by himself, propagated among his staff, communicated to the Prince de Joinville, who published it in France on his return there, and to the Comte de Paris, who after twenty years incorporated it in his history—that the enemy, having heard of his scheme for going to the Peninsula, through the indiscretion of the Government, had suddenly taken flight from Manassas. General McClellan asserts this in his report a dozen times; he reiterates it as if he felt that his reputation depended upon it. If it is not true, then in the long contest with the President in regard to a direct attack from Washington the President was right and McClellan was wrong.

The straightforward narrative of General Johnston, and the official orders and correspondence of the Confederate officers, show

that there is not the slightest foundation for this theory of General McClellan's. They show, on the contrary, that the rebel government, nearly a month before this, had concluded that Johnston's position was untenable; that Johnston had shared in the belief, and had begun his preparations to retire on the 22d of February; that instead of "ascertaining McClellan's intention to move to the lower Chesapeake," he had been of the opinion that McClellan would advance upon the line designated by Mr. Lincoln, because it was the best line for attack and the most difficult for the rebels to defend; that he knew McClellan's enormous superiority in numbers and did not purpose to risk everything in resisting him there; that on the 5th of March, having received information of unusual activity in our army in the direction of Dumfries, he gave his final orders, and on the 7th began to move. He proceeded with the greatest deliberation, writing to one of his generals on the 15th, "McClellan seems not to value time especially." His subordinates were equally convinced that the Confederate right was the object of the Union advance; Holmes wrote in that sense to Lee on the 14th of March. Lee, who was then directing military operations in Richmond, answered him on the 16th, concurring in this view, recognizing the "advantages" of such a plan, and saying, "That he will advance upon our line as soon as he can, I have no doubt." Until the 18th of March Johnston did not suspect that McClellan was not advancing to strike his right flank; he then fell back behind the Rapidan, to guard against other contingencies. Even while our vast army was passing down the Potomac he could not make out where it was going. So late as the early days of April, Jefferson Davis was in doubt as to McClellan's destination, and Johnston only heard of the advance upon Yorktown about the 5th of that month.

By the very test, therefore, to which General McClellan appeals in the paragraph quoted above, his conduct during the autumn and winter stands finally condemned. By their contemporaneous letters and orders, by their military movements in an important crisis, by their well-considered historical narratives, the Confederate government and generals have established these facts beyond all possibility of future refutation: that the plan for a direct attack suggested by Lincoln, and contemptu-

ously rejected by McClellan, was a sound and practicable one; it was the plan they expected and dreaded to see adopted, because it was the one easiest to accomplish and hardest to resist. When they fancied that they saw the Army of the Potomac preparing to move, it was this plan alone of which they thought; and they immediately gave up their position, which McClellan thought impregnable, as they had been for weeks preparing to do at the first intimation of a forward movement. The long delay of five months, during three of which the roads were in unusually fine condition,* during all of which the Union forces were as three to one of the enemy, remains absolutely without excuse. It can only be explained by that strange idiosyncrasy of General McClellan which led him always to double or treble the number of an enemy and the obstacles in his immediate vicinity.

It is little blame to Confederate generals that they could not divine what General McClellan was doing with the grand army of the Union during the week that followed the evacuation of Manassas. No soldier could have been expected to guess the meaning of that mysterious promenade of a vast army to Centreville and Manassas, and back to Alexandria. In spite of the "impassable roads," they made the journey with ease and celerity. The question why the whole army was taken has never been satisfactorily answered. General McClellan started away in too much confusion of mind to know precisely what he intended; his explanation afterward was that he wanted the troops to have a little experience of marching and to "get rid of their *impedimenta*." He claims in his report to have found on this excursion a full justification of his extravagant estimate of the enemy's force, and speaks with indignation of the calumnious stories of "quaker guns" which were rife in the press at the time. Every one now knows how fatally false the estimate was; and as to the "quaker guns," this is what General Johnston says about them:

As we had not artillery enough for their works and for the army fighting elsewhere at the same time, rough wooden imitations of guns were made, and kept near the embrasures, in readiness for exhibition in them. To conceal the absence of carriages, the embrasures were covered with sheds made of bushes. These were the quaker guns afterwards noticed in Northern papers.

Without further discussing where the fault

* Pollard's History, Vol. I., p. 184, says: "A long, lingering Indian summer, with roads more hard and skies more beautiful than Virginia had seen for many a year, invited the enemy to advance." "Johnston's Narrative" says that the roads were practicable until the last of December.

From the admirable monograph of Major-General A. S. Webb, Chief-of-Staff of the Army of the Poto-

mac, entitled "The Peninsula," we quote a sentence on this subject: "During all the time Johnston's army lay at Centreville insolently menacing Washington . . . it never presented an effective strength of over 50,000 men. With more than twice that number, McClellan remained inactive for many precious weeks, under the delusion that he was confronted by a force nearly equal his own."

lay, the fact is beyond dispute that when the evacuation of Manassas was known throughout the country, the military reputation of General McClellan received serious damage. No explanation made at the time, and, we may add, none made since then, could account satisfactorily for such a mistake as to the condition of the enemy, such utter ignorance as to his movements. The first result of it was the removal of General McClellan from the command of the armies of the United States. This resolution was taken by the President himself, on the 11th of March. On that day he prepared the order known as "President's War Order, No. 3," and in the evening called together Mr. Seward, Mr. Chase, and Mr. Stanton, and read it to them. It was in these words:

PRESIDENT'S WAR ORDER, No. 3.

EXECUTIVE MANSION,

WASHINGTON, March 11, 1862.

Major-General McClellan having personally taken the field at the head of the Army of the Potomac, until otherwise ordered he is relieved from the command of the other military departments, he retaining command of the Department of the Potomac.

Ordered further, That the departments now under the respective commands of Generals Halleck and Hunter, together with so much of that under General Buell as lies west of a north and south line indefinitely drawn through Knoxville, Tenn., be consolidated and designated the Department of the Mississippi, and that, until otherwise ordered, Major-General Halleck have command of said department.

Ordered also, That the country west of the Department of the Potomac and east of the Department of the Mississippi be a military department, to be called the Mountain Department, and that the same be commanded by Major-General Frémont. That all the commanders of departments, after the receipt of this order by them respectively, report severally and directly to the Secretary of War, and that prompt, full, and frequent reports will be expected of all and each of them.

ABRAHAM LINCOLN.

All the members of the Cabinet present heartily approved the order. The President gave his reason for issuing it while General McClellan was absent from Washington—a reason indeed apparent in the opening words, which were intended to take from the act any appearance of disfavor. The general's intimate biographers have agreed that it was because the President was afraid to do it while the general was in Washington! The manner of the order, which was meant as a kindness, was taken as a grievance. Mr. Seward advised that the order be issued in the name of the Secretary of War, but this proposition met with a decided protest from Mr. Stanton. He said there was some friction already between himself and the general's friends, and he feared that the act, if signed by him, would be attributed to personal feeling. The President decided to take the responsibility.* In a manly

* J. H., Diary.

and courteous letter the next day, McClellan accepted the disposition thus made of him.

On the 13th of March, at Fairfax Court House, General McClellan called together the four corps commanders who were with him and submitted to them for discussion the President's order of the 8th. The results of the council cannot be more briefly stated than in the following memorandum, drawn up by the generals who took part in it:

A council of the generals commanding army corps at the headquarters of the Army of the Potomac were of the opinion:

I. That the enemy having retreated from Manassas to Gordonsville, behind the Rappahannock and Rapidan, it is the opinion of the generals commanding army corps that the operations to be carried on will be best undertaken from Old Point Comfort, between the York and James rivers, provided—

First. That the enemy's vessel *Merrimac* can be neutralized;

Second. That the means of transportation, sufficient for an immediate transfer of the force to its new base, can be ready at Washington and Alexandria to move down the Potomac; and

Third. That a naval auxiliary force can be had to silence, or aid in silencing, the enemy's batteries on the York River.

Fourth. That the force to be left to cover Washington shall be such as to give an entire feeling of security for its safety from menace. (Unanimous.)

II. If the foregoing cannot be, the army should then be moved against the enemy behind the Rappahannock at the earliest possible moment, and the means for reconstructing bridges, repairing railroads, and stocking them with materials sufficient for supplying the army should at once be collected for both the Orange and Alexandria and Aquia and Richmond railroads. (Unanimous.)

N. B.—That with the forts on the right bank of the Potomac fully garrisoned, and those on the left bank occupied, a covering force in front of the Virginia line of 25,000 men would suffice. (Keyes, Heintzelman, and McDowell.) A total of 40,000 men for the defense of the city would suffice. (Sumner.)

These conclusions of the council were conveyed to Washington, and the President on the same day sent back to General McClellan his approval, and his peremptory orders for the instant execution of the plan proposed, in these words, signed by the Secretary of War:

The President, having considered the plan of operations agreed upon by yourself and the commanders of army corps, makes no objection to the same, but gives the following directions as to its execution: First, leave such force at Manassas Junction as shall make it entirely certain that the enemy shall not repossess himself of that position and line of communication. Second, leave Washington entirely secure. Third, move the remainder of the force down the Potomac, choosing a new base at Fortress Monroe, or anywhere between here and there, or, at all events, move such remainder of the army at once in pursuit of the enemy by some route.

No commander could ask an order more unrestricted, more unhampered, than this. Choose your own route, your own course, only go; seek the enemy and fight him.

Under the orders of Mr. John Tucker, of

the War Department, a fleet of transports had been preparing since the 27th of February. It is one of the many grievances mentioned by General McClellan in his report, that this work was taken entirely out of his hands and committed to those of Mr. Tucker; he thus estops himself from claiming any credit for one of the most brilliant feats of logistics ever recorded. On the 27th of February, Mr. Tucker received his orders; on the 17th of March, the troops began their embarkation; on the 5th of April, Mr. Tucker made his final report, announcing that he had transported to Fort Monroe, from Washington, Perryville, and Alexandria, "121,500 men, 14,592 animals, 1150 wagons, 44 batteries, 74 ambulances, besides pontoon bridges, telegraph materials, and the enormous quantity of equipage, etc., required for an army of such magnitude. The only loss," he adds, "of which I have heard is eight mules and nine barges, which latter went ashore in a gale within a few miles of Fort Monroe, the cargoes being saved." He is certainly justified in closing his story with these words: "I respectfully but confidently submit that, for economy and celerity of movement, this expedition is without a parallel on record."*

The first corps to embark was Heintzelman's; he took with him from General McClellan the most stringent orders to do nothing more than to select camping-grounds, send out reconnaissances, engage guides and spies, "but to make no important move in advance." The other forces embarked in turn, McDowell's corps being left to the last; and before it was ready to sail, General McClellan himself started on the 1st of April, with the headquarters on the steamer *Commodore*, leaving behind him a state of things that made it necessary to delay the departure of McDowell's troops still further.

In all the orders of the President it had been clearly stated that, as an absolute condition precedent to the army being taken away to a new base, enough troops should be left at Washington to make that city absolutely safe, not only from capture, but from serious menace. The partisans of General McClellan then, and ever since then, have contended that, as Washington could not be seriously attacked without exposing Richmond to capture, undue importance was attached to it in these orders. It would be a waste of words to argue with people who place the political and strategic value of these two cities on a level. The

capture of Richmond, without the previous virtual destruction of the rebel armies, would have been, it is true, an important achievement, but the seizure of Washington by the rebels would have been a fatal blow to the Union cause. General McClellan was in the habit of saying that if the rebel army should take Washington while he was at Richmond they could never get back; but it might be said that the general who would permit Washington to be taken could not be relied on to prevent the enemy from doing what they liked afterward. Mr. Lincoln was unquestionably right in insisting that Washington must not only be rendered safe from capture, but must also be without the possibility of serious danger. This view was adopted by the council of corps commanders, who met on the 13th of March at Fairfax Court House. They agreed unanimously upon this principle, and then, so as to leave no doubt as to details, three of the four gave the opinion that after the forts on the Virginia side were fully garrisoned, and those on the Maryland side occupied, a covering force of 25,000 men would be required.

The morning after General McClellan had sailed for Fort Monroe, the Secretary of War was astonished to hear from General Wadsworth, the military Governor of the District of Washington, that he had left him present for duty only 19,000 men, and that from that force he had orders to detach four good regiments to join General McClellan on the Peninsula, and four more to relieve Sumner at Manassas and Warrenton. He further reported that his command was entirely "inadequate to the important duty to which it was assigned." As General Wadsworth was a man of the highest intelligence, courage, and calm judgment, the President was greatly concerned by this emphatic statement. Orders were at once given to General E. A. Hitchcock, an accomplished veteran officer on duty at the War Department, and to Adjutant-General Thomas, to investigate the statement made by General Wadsworth. They reported the same night that it would require 30,000 men to man and occupy the forts, which, with the covering force of 25,000, would make 55,000 necessary for the proper defense of the city, according to the judgment of the council of corps commanders. They confirmed the report of Wadsworth that his efficient force consisted of 19,000, from which General McClellan had ordered eight regiments away. They therefore concluded "that the requirement of the President that the city should be left entirely secure had not been fully complied with." In accordance with this report the President directed that General McDowell's corps should

* The means by which this work was done were as follows:

113 steamers at an average price per day	\$215.10
188 schooners at an average price per day	24.45
88 barges at an average price per day	14.27

not be sent to the Peninsula until further orders.*

YORKTOWN.

GENERAL McCLELLAN arrived at Fort Monroe on the morning of the 2d of April. According to his own report he had ready the next day to move 58,000 men and 100 guns, besides the division artillery. They were of the flower of the volunteer army, and included also Sykes's brigade of regulars, Hunt's artillery reserve, and several regiments of cavalry. These were all on the spot, prepared to march, and an almost equal number were on their way to join him. He seemed at first to appreciate the necessity for prompt and decisive action, and with only one day's delay issued his orders for the march up the Peninsula between the York and James rivers. The first obstacle that he expected to meet was the force of General J. B. Magruder at Yorktown, which McClellan estimated at from 15,000 to 20,000. Magruder says his force consisted of 11,000, of which 6000 were required for the fortifications of Yorktown and only 5000 were left to hold the line across the Peninsula, 13 miles in length. His only object was to delay as long as possible the advance of the National troops upon Richmond, and his dispositions were made to that end. If he had had troops enough, he says that he would have made his line of defense between Ship Point, on the York, and the mouth of the Warwick, on the James. But his force being insufficient for that purpose, he took up as a second line the Warwick River, which heads only a mile or so from Yorktown and empties into the James some thirteen miles to the south. Yorktown and its redoubts, united by long curtains and flanked by rifle-pits, formed the left of his line, which was continued by the Warwick River, a sluggish and boggy stream running through a dense wood fringed with swamps. The stream was dammed in two places, at Wynn's Mill and at Lee's Mill; and Magruder constructed three more dams to back up the river and make the fords impassable. Each of these dams was protected by artillery and earth-works.

General McClellan was absolutely ignorant not only of these preparations made to receive him, but also of the course of the river and the nature of the ground through which it ran. He knew something of the disposition of Magruder's outposts on his first line, and rightly con-

jectured that they would retire as he advanced. His orders for the 4th of April were therefore punctually carried out, and he seemed to have expected no greater difficulty in his plan for the next day.† He divided his force into two columns — Heintzelman to take the right and march directly to Yorktown; and Keyes, taking the road to the left, to push on to the Half-way House in the rear of Yorktown, on the Williamsburg road. He expected Keyes to be there the same day, to occupy the narrow ridge in that neighborhood, "to prevent the escape of the garrison at Yorktown by land, and to prevent reinforcements from being thrown in." Heintzelman went forward to the place assigned him in front of Yorktown, meeting with little opposition. Keyes marched by the road assigned him until he came to the enemy's fortified position at Lee's Mill, which, to use General McClellan's words, "he found altogether stronger than was expected, unapproachable by reason of the Warwick River, and incapable of being carried by assault." The discovery of this "unexpected" obstacle exercised a paralyzing influence upon the General-in-Chief. The energetic and active campaign that day begun was at once given up. Two days of reconnaissances convinced him that he could not break through the line which Magruder's little army of 11,000 men had stretched across the Peninsula, and he resolved upon a regular siege of the place. He began at the same time that campaign of complaint and recrimination against the Government which he kept up as long as he remained in the service.

He always ascribed the failure of his campaign at this point to two causes; first, to the want of assistance by the navy in reducing Yorktown, and second, to the retention of McDowell's corps in front of Washington. If the navy had silenced the batteries at Yorktown and Gloucester, he contended, he could have gone up the Peninsula unchecked. This is unquestionably true; it would be equally true to say in general terms that if somebody else would do our work we would have no work to do. He brings no proof to show that he had any right to expect that the navy would do this for him. It is true that he asked before he left Washington that the navy might co-operate with him in this plan, and received in reply the assurance that the navy would render him all the assistance in its power. The sworn testimony of Mr. Fox, the Assistant-

* General McClellan made in his report an elaborate effort to explain away these facts. He claims to have left a force of 73,000 for the defense of Washington, including in the number all the troops under Dix in Maryland, under Banks in the Shenandoah, all those at Warrenton, at Manassas, and on the lower Potomac.

But he does not deny the facts stated by Wadsworth and confirmed by Hitchcock and Thomas.

† In a letter on the 3d he wrote: "I hope to get possession of Yorktown day after to-morrow." ["McClellan's Own Story," p. 307.]

Secretary of the Navy, and of Admiral Goldsborough, shows that nothing was promised that was not performed, and that the navy stood ready to give, and did give, all the assistance to the army which was possible. Mr. Fox said:

Wooden vessels could not have attacked the batteries at Yorktown and Gloucester with any degree of success. The forts at Yorktown were situated too high, were beyond the reach of naval guns; and I understood that General McClellan never expected any attack to be made upon them by the navy.

Admiral Goldsborough's evidence is to the same effect: he promised that the *Merrimac* should never go up the York River, and she did not; he never heard that he was expected to coöperate with the army in attacking Yorktown; he did everything that General McClellan requested of him. His orders from the department were clear and urgent, though general; he was "to extend to the army, at all times, any and all aid that he could render"; and he never refused to honor any draft that was made upon him. General McClellan pursued in this matter his invariable system. He asked for impossibilities, and when they were not accomplished for him he cherished it ever after as a precious grievance—like a certain species of lawyer, who in a case that he expects to lose always takes care to provide himself with a long bill of exceptions on which to base his appeal.

The greatest of his grievances was the retention of McDowell's corps, and his clamor in regard to this was so loud and long as to blind many careless readers and writers to the facts in the case. We have stated them already, but they may be briefly recapitulated here. A council of war of General McClellan's corps commanders, called by himself, had decided that Washington could not be safely left without a covering force of 55,000, including the garrisons of the forts. When he had gone, General Wadsworth reported that he had left only 19,000, and had ordered away nearly half of these. Two eminent generals in the War Department investigated this statement and found it true, whereupon the President ordered that McDowell's corps should for the present remain within reach of Washington. McClellan took with him to the Peninsula an aggregate force of over 100,000 men, afterwards largely increased. His own morning

report of the 13th of April, signed by himself and his adjutant-general, shows that he had with him actually present for duty 100,970. With this overwhelming superiority of numbers he could have detached 30,000 men at any moment to do the work that he had intended McDowell to do. But all the energy he might have employed in this work he diverted in attacking the Administration at Washington, which was doing all that it could do to support and provide for his army.

The attitude of the President towards him at this time may be seen from the following letter of the 9th of April, in which Mr. Lincoln answers his complaints with as much consideration and kindness as a father would use towards a querulous and petulant child:

Your dispatches complaining that you are not properly sustained, while they do not offend me, do pain me very much.

Blenker's division was withdrawn from you before you left here, and you know the pressure under which I did it, and, as I thought, acquiesced in it—certainly not without reluctance. After you left, I ascertained that less than 20,000 unorganized men, without a single field battery, were all you designed to be left for the defense of Washington and Manassas Junction, and part of this even was to go to General Hooker's old position. General Banks's corps, once designed for Manassas Junction, was diverted and tied up on the line of Winchester and Strasburg, and could not leave it without again exposing the upper Potomac and the Baltimore and Ohio Railroad. This presented, or would present when McDowell and Sumner should be gone, a great temptation to the enemy to turn back from the Rappahannock and sack Washington. My official order that Washington should, by the judgment of all the commanders of army corps, be left entirely secure, had been neglected. It was precisely this that drove me to detain McDowell.

I do not forget that I was satisfied with your arrangement to leave Banks at Manassas Junction; but when that arrangement was broken up, and nothing was substituted for it, of course I was constrained to substitute something for it myself. And now allow me to ask, do you really think I should permit the line from Richmond via Manassas Junction to this city to be entirely open, except what resistance could be presented by less than 20,000 unorganized troops? This is a question which the country will not allow me to evade.

There is a curious mystery about the number of troops now with you. When I telegraphed you on the 6th saying you had over 100,000 with you, I had just obtained from the Secretary of War a statement taken, as he said, from your own returns, making 108,000 then with you and en route to you. You now say you will have but 85,000 when all en route to you shall have reached you. How can the discrepancy of 23,000 be accounted for?*

As to General Wool's command, I understand it is doing for you precisely what a like number of your

* The discrepancy cannot be accounted for. General McClellan's official morning report of the 13th of April, four days after the date of the President's letter, gives the following: "Number of troops composing the Army of the Potomac after its disembarkation on the Peninsula: Aggregate present for duty, 100,970; on special duty, sick, and in arrest, 4265; aggregate absent, 12,486,—total aggregate, 117,721." Yet with

statements like these on file in the War Department, over his own signature, he did not hesitate to inform the President that his force amounted to only 85,000; and even this sum dwindled so considerably, as years rolled by, that in his article in *THE CENTURY*, in May, 1885, on the Peninsula Campaign, he gives his available fighting force as "67,000 or 68,000."

own would have to do if that command was away. I suppose the whole force which has gone forward for you is with you by this time, and if so, I think it is the precise time for you to strike a blow. By delay the enemy will relatively gain upon you—that is, he will gain faster by fortifications and reinforcements than you can by reinforcements alone. And once more let me tell you it is indispensable to you that you strike a blow. I am powerless to help this. You will do me the justice to remember I always insisted that going down the bay in search of a field, instead of fighting at or near Manassas, was only shifting and not surmounting a difficulty; that we would find the same enemy and the same or equal intrenchments at either place. The country will not fail to note, is now noting, that the present hesitation to move upon an intrenched enemy is but the story of Manassas repeated.

I beg to assure you that I have never written you or spoken to you in greater kindness of feeling than now, nor with a fuller purpose to sustain you, so far as, in my most anxious judgment, I consistently can. But you must act.

These considerations produced no impression upon General McClellan. From the beginning to the end of the siege of Yorktown, his dispatches were one incessant cry for men and guns. These the Government furnished to the utmost extent possible, but nothing contented him. His hallucination of overwhelming forces opposed to him began again, as violent as it was during the winter. On the 8th of April he wrote to Admiral Goldsborough, "I am probably weaker than they are, or soon will be." His distress is sometimes comic in its expression. He writes on the 7th of April, "The Warwick River grows worse the more you look at it." While demanding McDowell's corps *en bloc* he asked on the 5th for Franklin's division, and on the 10th repeated this request, saying that although he wanted more, he would be responsible for the results if Franklin's division were sent him. The Government, overborne by his importunity, gave orders the same day that Franklin's division should go to him, and the arrangements for transporting them were made with the greatest diligence. He was delighted with this news; and although the weather was good and the roads improving, he did nothing but throw up earth-works until they came. They arrived on the 20th, and no use whatever was made of them! He kept them in the transports in which they had come down the bay more than two weeks—in fact, until the day before the siege ended. It is hard to speak with proper moderation of so ridiculous a disposition of this most valuable force, so clamorously demanded by General McClellan, and so generously sent him by the President. General Webb, the intimate friend and staff-officer of McClellan, thus speaks of it:

Lieutenant-Colonel Alexander of the Corps of Engineers was instructed to devise the proper arrangements and superintend the landing of the troops; but

extraordinary as it may seem, more than two weeks were consumed in the preliminaries, and when everything was nearly ready for the disembarkation the enemy had vanished from the scene. . . . How long it would have taken the whole of McDowell's corps to disembark at this rate . . . the reader may judge; and yet for days it had been McClellan's pet project, in connection with his plan of campaign, to natural McDowell in just this manner as a flanking column.

The simple truth is, there was never an hour during General McClellan's command of the army that he had not more troops than he knew what to do with; yet he was always instinctively calling for more. Mr. Stanton one day said of him, with natural hyperbole:

If he had a million men, he would swear the enemy had two millions, and then he would sit down in the mud and yell for three.

As usual with him, he entirely mistook the position, the strength, and the intentions of the enemy. He repeatedly telegraphed to Washington that he expected to fight an equal or greater force—in fact, "all the available force of the rebels" in the neighborhood of Yorktown. We have the concurrent testimony of all the Confederate authorities that no such plan was ever thought of. Magruder's intentions, as well as his orders from Richmond, were merely to delay McClellan's advance as long as practicable. His success in this purpose surpassed his most sanguine expectations. In the early days of April he was hourly expecting an attack at some point on his thinly defended line of 13 miles, guarded, as he says, by only 5000 men, exclusive of the 6000 who garrisoned Yorktown. "But to my utter surprise," he continues, "he permitted day after day to elapse without an assault." At last, no less to his astonishment than to his delight, Magruder discovered that McClellan was beginning a regular siege, which meant a gain of several weeks for the rebel defense of Richmond, and absolute safety for the concentration of rebel troops in the mean time.

It is now perfectly clear to all military critics not blinded by partisanship or personal partiality that McClellan could have carried the line of Magruder by assault at any time during the early days of April. From the mass of testimony to this effect before us we will take only two or three expressions, of the highest authority. General A. S. Webb says:

That the Warwick line could have been readily broken within a week after the army's arrival before it, we now know.

General Heintzelman says, in his evidence before the Committee on the Conduct of the War:

I think if I had been permitted, when I first landed on the Peninsula, to advance, I could have isolated the

troops in Yorktown, and the place would have fallen in a few days; but my orders were very stringent not to make any demonstration.

General Barnard, McClellan's Chief of Engineers, says in his final report of the campaign that the lines of Yorktown should have been assaulted:

There is reason to believe that they were not held by strong force when our army appeared before them, and we know that they were far from complete. . . . Our troops toiled a month in the trenches, or lay in the swamps of the Warwick. We lost few men by the siege, but disease took a fearful hold of the army, and toil and hardship, unrelieved by the excitement of combat, impaired the morale. We did not carry with us from Yorktown so good an army as we took there.

The testimony of the enemy is the same. Johnston, so soon as he came to examine it, regarded the position of Magruder as clearly untenable: saw that McClellan could not be defeated there; that the line was too long to be successfully defended; that the back-water was as much a protection to one side as the other; that there was a considerable unfortified space between Yorktown and the head of the stream, open to attack; and that the position could at any time be turned by way of York River. Every one seemed to see it except General McClellan. He went on sending dispatches every day to Washington for heavier guns and more men, digging a colossal system of earth-works for gradual approach upon one side of an intrenched camp of no strategic value whatever, the rear of which was entirely open; preparing with infinite labor and loss the capture of a place without a prisoner, the effect of which at the best would be merely to push an army back upon its reserves.

Even so late as the 16th of April, an opportunity to break Magruder's line was clearly presented to McClellan and rejected. He had ordered General W. F. Smith to reconnoiter a position known as Dam No. 1, between Lee's and Wynn's Mills, where there was a crossing covered by a one-gun battery of the enemy. For this purpose Smith pushed Brooks's Vermont brigade with Mott's battery somewhat close to the dam, carrying on a sharp fire. From this point he examined at his leisure, and in fact controlled, the position opposite, finding it feebly defended. A young officer of Brooks's staff, Lieutenant Noyes, crossed the river below the dam, where the water was only waist deep, and approached within fifty yards of the enemy's works. Returning after this daring feat, he repeated his observations to General Smith and to General McClellan, who had arrived on the ground and had ordered Smith to bring up his entire division to hold the advanced position occupied by Brooks's brigade. Smith, who per-

ceived the importance of Noyes's intelligence, obtained permission to send a party across the stream to see if the enemy's works had been sufficiently denuded to enable a column to effect a lodgment. Four companies of the 3d Vermont, numbering 200 men, under Captain Harrington, were ordered to cross the river, to ascertain "the true state of affairs." They dashed through the stream, and in a few moments gained the enemy's rifle-pits, where they maintained themselves with the utmost gallantry for half an hour. The enemy was thrown into great confusion by this bold and utterly unexpected movement. There were still several hours of daylight left, and another attempt was made to cross at the same point with a force no larger than Harrington's, assisted by a diversion of an equal force at the dam above. But the enemy being now thoroughly aroused and concentrated, the crossing was not made. It appears from General Smith's report that "no attempt to mass the troops of the division for an assault was made"; the only intention seemed to be "to secure the enemy's works if we found them abandoned!" He adds:

The moment I found resistance serious, and the numbers opposed great, I acted in obedience to the warning instructions of the General-in-Chief, and withdrew the small number of troops exposed from under fire.

"Thus," says General Webb, "a fair opportunity to break the Warwick line was missed."

The importance of this incident may be best appreciated by reading General Magruder's account of it. He calls it a serious attempt to break his line at the weakest part. If, instead of two hundred men, Smith had felt authorized to push over his entire division, the Peninsula campaign would have had a very different termination.

The little that was done greatly pleased General McClellan. He announced the movement of General Smith in a somewhat excited dispatch to the War Department, which Mr. Stanton answered with still more enthusiastic congratulation. "Good for the first lick!" he shouts; "Hurrah for Smith and the one-gun battery"—showing the intense eagerness of the Government to find motives for satisfaction and congratulation in McClellan's conduct. But there was no sequel to the movement; indeed, General McClellan's dispatches indicate considerable complacency that Smith was able to hold the position gained. General Webb says, "Reconnaissances were made, . . . but no assaulting columns were ever organized to take advantage of any opportunity offered."

No congratulations or encouragements from the Government now availed anything with

McClellan. Struggling with a command and a responsibility too heavy for him, he had fallen into a morbid state of mind in which prompt and energetic action was impossible. His double illusion of an overpowering force of the enemy in his front, and of a government at Washington that desired the destruction of his army, was always present with him, exerting its paralyzing influence on all his plans and actions. In his private letters he speaks of Washington as that "sink of iniquity"; of the people in authority as "those treacherous hounds"; of the predicament he is in, "the rebels on one side and the Abolitionists and other scoundrels on the other." "I feel," he says, "that the fate of a nation depends upon me, and I feel that I have not one single friend at the seat of government"—this at a moment when the Government was straining every nerve to support him.

The Confederates, as Mr. Lincoln had said, were daily strengthening their position by fortification and reënforcement. On the 17th of April, General Joseph E. Johnston took command of the army of the Peninsula. He says that his force after the arrival of Smith's and Longstreet's divisions amounted to about 53,000 men, including 3000 sick; he places the force of McClellan at 133,000, including Franklin's division of 13,000 floating idly on their transports.* He did nothing more than to observe the Union army closely, to complete the fortifications between Yorktown and the inundations of the Warwick, and to hold his own forces in readiness for a movement to the rear. He kept himself informed of the progress of McClellan's engineering work against Yorktown, as it was not his intention to remain long enough to spend an hour under fire. He did not expect to be hurried; he had long before that given his opinion that McClellan did not especially value time. Every day of delay was of course an advantage, but "an additional day or two gained by enduring a cannonade would have been dearly bought in blood," and he therefore determined to go before McClellan's powerful artillery should open upon him. Seeing, as we now can, what was occurring upon both sides of the Warwick River, there is something humiliating and not without a touch of the pathetic in the contrast between the clear vision of Johnston and the absolute blindness of McClellan, in relation to each other's attitude and purpose. While the former was simply watching for the flash of the first guns to take his departure,

glad of every day that the firing was postponed, but entirely indifferent to the enormous development of the siege-works going on in his sight, the latter was toiling with prodigious industry and ability over his vast earth-works and his formidable batteries, only pausing to send importunate dispatches to Washington for more guns and more soldiers, forbidding the advance of a picket beyond specified limits, carefully concealing every battery until all should be finished, not allowing a gun to be fired until the whole thunderous chorus should open at once, firmly convinced that when he was entirely ready he would fight and destroy the whole rebel army.

Nearly one hundred heavy Parrott guns, mortars, and howitzers were placed in battery against the town and camp of Yorktown and its outlying works, only fifteen hundred or two thousand yards away. Against the opinion of his ablest staff-officers, McClellan kept this immense armament silent for weeks while he was continually adding to it. Barnard, Chief of Engineers, says, "We should have opened our batteries on the place as fast as they were completed." Barry, Chief of Artillery, says:

The ease with which the 100 and 200 pounders of this battery [Battery No. 1] were worked, the extraordinary accuracy of their fire, and the since ascertained effects produced upon the enemy by it, force upon me the conviction that the fire of guns of similar caliber and power in the other batteries at much shorter ranges, combined with the cross-vertical fire of the thirteen and ten inch sea-coast mortars, would have compelled the enemy to surrender or abandon his works in less than twelve hours.

General McClellan's only reason for refusing to allow the batteries to open fire as they were successively finished was the fear that they would be silenced by the converging fire of the enemy as soon as they betrayed their position. That this was a gross error is shown by the Confederate reports. They were perfectly cognizant of the progress and disposition of his batteries; the very good reason why they did not annoy him in their construction was that the Union lines were, to use Johnston's words, "beyond the range of our old-fashioned ship guns." A few experimental shots were fired from the shore batteries on the 1st of May; the effect of them convinced the Confederate general of the enormous surplus strength of the Federal artillery. The shots from their first volley fell on the camp of his reserve, a mile and a half beyond the village.†

* His own force is correctly given. He only slightly exaggerates that of McClellan.

† On the 23d of April, McClellan wrote to the President: "Do not misunderstand the apparent inaction here—not a day, not an hour, has been lost. Works

have been constructed that may almost be called gigantic, roads built through swamps and difficult ravines, material brought up, batteries built. I have to-night in battery and ready for motion 5 100-pounder Parrott guns, 10 4½-inch ordnance guns, 18 20-pounder Par-

How long General McClellan would have continued this futile labor if he had been left alone, it is impossible to conjecture. If there was at first a limit in his own mind of the work to be done and the time to be given to it, it must have been continually moved forward until it passed out of sight. Up to the last moment he was still making demands which it would have taken weeks to fill. The completion of one work was simply an incentive to the beginning of another. Thus on the 28th of April,—a week after Franklin's arrival,—at a time when Johnston was already preparing to start for Richmond, he telegraphs to Washington as a pleasant bit of news that he "had commenced a new battery from right of first parallel," and adds: "Would be glad to have the 30-pounder Parrotts in the works around Washington at once. Am very short of that excellent gun." It is not difficult to imagine how such a dispatch at such a time smote upon the intense anxiety of the President. He answered in wonder and displeasure: "Your call for Parrott guns from Washington alarms me, chiefly because it argues indefinite procrastination. Is anything to be done?" But the general, busy with his trenches and his equipments, paid no regard to this searching question. Two days later, May 1, he continued his cheery report of new batteries and rifle-pits, and adds, "Enemy still in force and working hard"; and these stereotyped phrases last with no premonition of any immediate change until on the 4th he telegraphed, "Yorktown is in our possession," and later in the day began to magnify his victory, telling what spoils he had captured, and ending with the sounding phrases, "No time shall be lost. I shall push the enemy to the wall."

Johnston had begun his preparations to move on the 27th of April, and on the 3d of May, finding that McClellan's batteries were now ready to open,—a fact apparently not yet known to McClellan,—he gave orders for the evacuation, which began at midnight. He marched away from Yorktown with about 50,000 men. General McClellan, by his own morning report of the 30th of April, had in his camps and trenches, and scrambling in haste on board the transports that they had quitted the day before, the magnificent aggregate of 112,392 present for duty, and a total aggregate of 130,378.

rotts, 6 Napoleon guns, and 6 10-pounder Parrotts; this not counting the batteries in front of Smith and on his left — 45 guns. I will add to it to-morrow night 5 30-pounder Parrotts, 6 20-pounder Parrotts, from 5 to 10 13-inch mortars, and—if they arrive in time—one 200-pounder Parrott. Before sundown to-morrow I will

FROM WILLIAMSBURG TO FAIR OAKS.

THE evacuation of Yorktown took General McClellan so completely by surprise that a good deal of valuable time was lost in hurried preparation to pursue the retreating enemy. Franklin's division, after their fortnight of delay on the transports, had been disembarked. They were hastily returned to their boats. Says Webb:

Several hours were consumed in having the commands properly provisioned for the march. The evacuation was discovered at dawn, and it was noon before the first column started in pursuit. Johnston by this time had taken his entire command to Williamsburg. Knowing that McClellan's advance would soon reach him, he made his dispositions at his leisure. He posted a strong rear-guard there under Longstreet to protect the movement of his trains. The Union cavalry under Sherman came into collision with this force about dark and was repulsed, losing one gun. The main body of the pursuing army came up during the night, under the command of Generals Sumner, Heintzelman, and Keyes. It is strongly illustrative of General McClellan's relations with his corps commanders, that neither of these generals had any orders from him as to the conduct of the battle which was inevitable as soon as they overtook the enemy, and there was even serious doubt as to which among them was in command of the forces. Sumner had been ordered by the General-in-Chief to take command in his absence, but these orders had not been communicated to Heintzelman, who thought that he was to take control of the movement.

There was some confusion of orders as to the roads to be taken by the different commands, in consequence of which Hooker came into position on the left of the line and Smith on the right. The contrary disposition had been intended.

The morning of the 5th came with no definite plan of battle arranged. General Hooker, following his own martial instincts, moved forward and attacked the enemy at half-past 7 and was soon hotly engaged. He fought almost the entire rear-guard of Johnston during the whole forenoon. Heavy reinforcements thrown against him checked his advance and caused him to lose the ground he had gained. Hooker speaks in his report with much bitterness, not wholly unjustified, of the manner in which his division was left to fight an overwhelming force, "unaided in the presence of more than 30,000 of their comrades with arms in their hands," and we search the reports of General McClellan and the corps commanders in vain for any adequate explanation of this state of things.

The whole day was bloody and expensive

essentially complete the redoubt necessary to strengthen the first parallel as far as Wormley's Creek from the left, and probably all the way to York River to-morrow night. *I will then be secure against sorties.*" [McClellan to Lincoln, April 23. MS.] With a force of three to one he was wasting weeks in defensive works.

and without adequate result. The heroism of Hooker and Hancock, and their brave troops, was well-nigh wasted. There was no head, no intelligent director, no understood plan. McClellan arrived late in the day and was unable to contribute anything to the result, although the cheers with which he was welcomed showed how fully he possessed the confidence and affection of his troops. He had not anticipated so early an engagement, and was spending the day at Yorktown to dispatch Franklin's division up the river.

Actual contact with the enemy, however, made, as it always did, an exaggerated impression upon him. The affair, which when he heard of it at Yorktown seemed to him a mere skirmish with a rear-guard, suddenly acquired a portentous importance when surveyed in the light of the bivouac at Williamsburg, amidst the actual and visible signs of a sanguinary conflict. His dispatch to the War Department, written at 10 o'clock the night of the battle, betrays great agitation, and his idiosyncrasy of multiplying the number of his enemy, as a matter of course, asserts itself. "I find General Joe Johnston in front of me in strong force, probably greater a good deal than my own." After a compliment to Hancock he continues, "I learn from the prisoners taken that the rebels intend to dispute every step to Richmond." One can only wonder what he expected them to say. "I shall run the risk of at least holding them in check here, while I resume the original plan. My entire force is undoubtedly inferior to that of the rebels, who will fight well."* Thus while Johnston was profiting by the darkness to prepare to continue his retrograde march at daybreak, McClellan was nerving himself to stand the risk of holding his ground at Williamsburg, while he "resumed the original plan" of a movement by water.

The next day, when he discovered that the enemy had moved away, leaving their wounded on the field of battle, his apprehension of attack subsided, but other difficulties rose before him. He telegraphed on the 7th to the Secretary of War that "until the roads improved both in front and rear no large body of troops could be moved." Johnston had apparently no difficulty in moving his troops, which McClellan thought a larger body than his own.

Reaching a place called Baltimore Cross-Roads, Johnston halted for five days, and, after receiving intelligence of the evacuation of

Norfolk and the destruction of the *Merrimac*, apprehending an attack upon Richmond by way of the James River, he ordered his forces to cross the Chickahominy on the 15th. Two days after this the rebel army encamped about three miles from Richmond, in front of the line of redoubts that had been constructed the previous year. It was a time of great apprehension, almost of dismay, at Richmond. The Confederate President, and most of his cabinet, hastily sent their families to places of safety. Mr. Davis, whose religious feelings always took on a peculiar intensity in critical times, had himself baptized at home, and privately confirmed at St. Paul's Church. There was great doubt whether the city could be successfully defended; the most important archives of the Government were sent, some to Lynchburg and some to Columbia.†

But General Johnston had reason to confirm his opinion that McClellan cared little for time. He remained several days at Williamsburg after he had ascertained that the enemy had disappeared from in front of him. His visions of overwhelming forces of rebels were now transferred to Franklin's front. On the 8th he telegraphed the War Department a story of 80,000 to 120,000 opposed to Franklin, but in full retreat to the Chickahominy. On the 10th he sends an urgent appeal to Washington for more troops, claiming that the enemy "are collecting troops from all quarters, especially well-disciplined troops from the South." His own army will inevitably be reduced by sickness, casualties, garrisons, and guards—as if that of the enemy would not. He therefore implores large and immediate reinforcements in a tone which implies that the President could make armies by executive decree. "If I am not reinforced," he says, "it is probable that I will be obliged to fight nearly double my numbers, strongly intrenched." In face of a morning report of over 100,000 men present for duty he says: "I do not think it will be at all possible for me to bring more than 70,000 men upon the field of battle." This last statement was in one sense true; he never did, and it is to be presumed he never could, handle that many men at once. All his battles were fought piecemeal with a part of his force at a time.

He still protested stoutly against the original organization of his army corps, and asked that he might be permitted to break it up or at least to suspend it. He disliked his corps

* On the 6th of May the veteran General Wool sent this dispatch to the War Department, showing how his elders regarded at the time these jeremiads of the young general: "The desponding tone of Major-General McClellan's dispatch of last evening more than surprises me. He says his entire force is undoubtedly

considerably inferior to that of the rebels. If such is the fact, I am still more surprised that they should have abandoned Yorktown." [War Records.]

† J. B. Jones, "A Rebel War Clerk's Diary," entries of May 8, May 10, and May 19.

commanders, and naturally wished his friends to exercise those important commands. He blamed the corps organization for all the trouble at Williamsburg, and said, if he had come on the field half an hour later, all would have been lost. The President was greatly wounded by this persistent manifestation of bad temper, but bore it after his fashion with untiring patience and kindness. He sent an official order, authorizing McClellan to suspend temporarily the corps organization in the Army of the Potomac, and to adopt any that he might see fit, until further orders. At the same time he wrote a private letter to the general, full of wise and kindly warning. He said:

I ordered the army corps' organization not only on the unanimous opinion of the twelve generals whom you had selected and assigned as generals of division, but also on the unanimous opinion of every military man I could get an opinion from, and every modern military book, yourself alone excepted. Of course I did not on my own judgment pretend to understand the subject. I now think it indispensable for you to know how your struggle against it is received in quarters which we cannot entirely disregard. It is looked upon as merely an effort to pamper one or two pets and to persecute and degrade their supposed rivals. I have had no word from Sumner, Heintzelman, or Keyes. The commanders of these corps are of course the three highest officers with you, but I am constantly told that you have no consultation or communication with them; that you consult and communicate with nobody but General Fitz-John Porter and perhaps General Franklin. I do not say these complaints are true or just, but at all events it is proper you should know of their existence. Do the commanders of corps disobey your orders in anything? When you relieved General Hamilton of his command the other day, you thereby lost the confidence of at least one of your best friends in the Senate. And here let me say, not as applicable to you personally, that senators and representatives speak of me in their places as they please without question, and that officers of the army must cease addressing insulting letters to them for taking no great liberty with them. But to return. Are you strong enough — are you strong enough even with my help — to set your foot upon the necks of Sumner, Heintzelman, and Keyes all at once? This is a practical and very serious question for you. The success of your army and the cause of the country are the same, and of course I only desire the good of the cause.

General McClellan accepted the authorization with alacrity and the sermon with indifference. He at once formed two provisional army corps, giving Fitz-John Porter the command of one and Franklin the other.

After leaving Williamsburg and joining his army at Cumberland, he reiterated his complaints and entreated for reinforcements that it was not in the power of the Government to send him. His morbid apprehension had grown to such an extent that on the 14th of May he telegraphed his conviction that he would be compelled, with 80,000 men, to fight 160,000 rebels in front of Richmond; and begged that the Government would send

him "by water" — he did not want them to come overland — "all the disposable troops," "every man" that could be mustered. The President, anxious to leave nothing undone to help and encourage him, replied to these important demands first by a friendly private note, in which he said:

I have done and shall do all I could and can to sustain you. I hoped that the opening of the James River and putting Wool and Burnside in communication, with an open road to Richmond, or to you, had effected something in that direction. I am still unwilling to take all our forces off the direct line between Richmond and here.

He afterwards sent a dispatch through the War Department, of which the essential points are as follows:

The President is not willing to uncover the Capital entirely, and it is believed that even if this were prudent, it would require more time to effect a junction between your army and that of the Rappahannock by way of the Potomac and York rivers than by a land march. In order therefore to increase the strength of the attack upon Richmond at the earliest moment, General McDowell has been ordered to march upon that city by the shortest route. He is ordered — keeping himself always in position to save the Capital from all possible attack — so to operate as to put his left wing in communication with your right wing, and you are instructed to coöperate so as to establish this communication as soon as possible, by extending your right wing to the north of Richmond, . . . but charged, in attempting this, not to uncover the city of Washington; and you will give no order, either before or after your junction, which can put him out of position to cover this city. . . . The President desires that General McDowell retain the command of the Department of the Rappahannock, and of the forces with which he moved forward.

Events as little foreseen by General McClellan as by the Government, and which had by him been declared impossible, — the defeat of our forces in the Shenandoah and the movement of a large rebel force to the upper Potomac, — prevented the execution of this plan. But it is worthy of notice that immediately on the receipt of the President's instructions, while he was waiting for McDowell to join him, General McClellan evinced no gratification at this compliance with his wishes. On the contrary, he lost no time in making a grievance of it; he wrote a long and elaborate dispatch protesting against it, and asking that "McDowell should be placed explicitly under his orders in the ordinary way." In his report, and in all his subsequent apologies for his campaign, he makes this positive assertion:

This order rendered it impossible for me to use the James River as a line of operations, and forced me to establish our depots on the Pamunkey and to approach Richmond from the north.

This charge is an evident after-thought, and is no less lacking in adroitness than in candor. We will permit it to be answered by General

Webb, the ablest military writer on the Peninsula campaign, who is always the friend of McClellan, and his partisan wherever the writer's intelligence and conscience allow it. He says:

It is but repeating the proper criticisms made by other writers that General McClellan had frequently mentioned the Pamunkey as his prospective base; that he made no representation to the Government, at the time, that he wished to be free to move by the James; and that it was within his power during the first three weeks of June, when he found that McDowell was again withheld from him, to follow the latter route. On one point there can be no question — that the position of his army, as already given, along the left bank of the Chickahominy from Bottom's towards New Bridge, on May 20, with the White House, on the Pamunkey, as the base of supplies, was one of McClellan's own choice, uninfluenced by McDowell's movements.

It required ten days after the fight at Williamsburg for McClellan's headquarters to reach Cumberland, on the south bank of the Pamunkey, and on the next day he established his permanent depot at the White House, near by. On the 21st the army was brought together and established in line on the Chickahominy, the right wing being about seven and the left about twelve miles from Richmond, from which they were separated by two formidable barriers — the rebel army, and the river with its environment of woods and swamps, its fever-breathing airs and its sudden floods. The latter was first attacked. General McClellan began at once with great energy the building of several bridges over the stream, a work of special difficulty on account of the boggy banks, which made long approaches necessary. In this work, and in a voluminous correspondence with the President in regard to reinforcements, which we shall notice when we come to treat of those movements of Jackson's in the valley that caused the division of McDowell's force, he passed ten days; he pushed the corps of Keyes and Heintzelman across the river, and retained those of Sumner, Franklin, and Porter on the north side.

The monotony of camp life was broken up on the 27th of May by a brilliant feat of arms performed by Fitz-John Porter and his corps at Hanover Court House, where he attacked and defeated a rebel force under General Branch. The chief value of this battle was its demonstration of the splendid marching and fighting qualities of the troops engaged. General McClellan was greatly annoyed that the President did not seem to attach sufficient importance to this action; but General Johnston in his "Narrative," while not diminishing the gallantry of Porter and his troops, or denying the complete defeat of Branch, treats it merely as an incident of Branch's march under orders to join Anderson, which was accomplished

the same day at the point designated for this junction. There was no sequel to the fight. Porter and his victorious troops marched back to camp.

On the 26th of May, General McClellan informed the President that he was "quietly closing in upon the enemy preparatory to the last struggle," and that he would be "free to strike" on the return of Porter. But several days elapsed without the blow being struck, until the enemy, as usual, accelerated matters by himself striking. It had been for some time the intention of General Johnston to attack the Union army before McDowell should join it; and learning, on the day of the battle of Hanover Court House, that McDowell was leaving Fredericksburg, he resolved at once to strike McClellan's force on both sides of the river. When we consider that the consolidated returns of the Army of the Potomac for the 31st of May showed an aggregate of 127,166 officers and men, of whom there were 98,000 present for duty, with 280 pieces of field artillery, and that General Johnston's force amounted to about 60,000 effectives, we cannot but think it was a fortunate circumstance for him that he did not attempt to carry this heroic plan into effect. At night, when he had called his general officers together for their instruction, Johnston was informed that McDowell's force, which had been marching southward, had returned to Fredericksburg. He then abandoned his idea of attacking McClellan on both sides of the river, and reverted to his former plan of assailing with his whole force the two corps on the south bank as soon as they had sufficiently increased the distance between themselves and the three corps on the north.

In this plan, as in the other one,—and we shall see, farther on, that the same was the case with General Lee,—General Johnston does not seem to have taken into the account the possible initiative of General McClellan. He makes his plans entirely without reference to it, choosing his time for attack absolutely at his own convenience. He takes it for granted that he will be met with a courageous and able defense — but nothing more. The worst he has to fear in any case is a repulse; there seems no thought of an offensive return in his mind. The Northern general, on the contrary, judged his adversary with more courtesy than justice. He evidently had no suspicion of Johnston's intentions. At the moment that the latter was calling his generals together to give orders for the assault, McClellan was telegraphing to Washington: "Richmond papers urge Johnston to attack, now that he has us away from gun-boats. I think he is too able for that."

Johnston's purpose was finally adopted and put in action with great decision and promptitude. On the 30th D. H. Hill informed him that the Federals were in force at Seven Pines, and that the indications were that all of Keyes's corps was south of the river; to which Johnston immediately responded by telling him he would attack the next morning. Within an hour or two his whole plan of battle was arranged. Orders were given to throw twenty-three of the twenty-seven brigades of which the Confederate army consisted against the two corps of Heintzelman and Keyes.* The rest were to observe the river by the Meadow and New bridges. After the plan of battle was arranged, a violent storm of rain came on and continued most of the night. This was a welcome incident to Johnston, as it inspired the hope that the river might overflow its banks and sever the communication between the two wings of the Federal army. He did not permit the rain to delay him.

The forces commanded by Longstreet and Hill attacked Casey's division of Keyes's corps with great impetuosity, and in overwhelming numbers, about 1 o'clock in the afternoon. Keyes's corps, supported by those of Heintzelman, defended their ground with gallantry and pertinacity; but the numbers opposed to them were too great, and they gradually and sullenly gave way, retiring inch by inch, until, as night came on, they had been forced more than a mile and a half east of the position that they had occupied in the morning.

The forces under G. W. Smith, accompanied by Johnston in person, whose duty it had been to strike the right flank of the Union army as soon as the assault of Longstreet and Hill became fully developed on the left, were delayed for some time on account of a peculiar condition of the atmosphere, which prevented the sound of the musketry from reaching from Seven Pines to the headquarters of Smith on the Nine-mile road. But about 4 o'clock, Johnston, having been informed of the progress of affairs in Longstreet's front, determined to put Smith in upon the Union right flank, being by this time relieved of all fear of a reinforcement from the other side of the river. Fortunately for the Union cause, the forces immediately opposite this position were commanded by General Sumner, an officer whose strongest traits were soldierly ardor and generosity. He had been ordered, as soon as the firing began, to hold himself in readiness to move to the assistance of his comrades at Fair Oaks; but he gave these orders a liberal interpretation, and instead of merely preparing to

move he at once marched with two divisions to the two bridges he had built and halted them, with his leading companies at the bridges. In this manner an hour of inestimable advantage was saved. The swollen river soon carried away one of the bridges, and the other was almost submerged when the order came to Sumner to cross.

Without delaying a moment on the west bank, Sumner marched through the thick mud in the direction of the heaviest firing and repulsed the attacks of Smith. This Union success was the result of Sumner's straightforward and unhesitating march. His appointment to the command of an army corps had been bitterly opposed and never forgiven by General McClellan; he had been treated by his commander with studied neglect and disrespect; and this magnificent service was his only revenge. About 7 o'clock the Confederates met their severest mischance of the day; General Johnston received at an interval of a few moments two severe and disabling wounds.

The firing ceased, "terminated by darkness only," Johnston is careful to say, before he had been borne a mile from the field. The command had devolved by seniority of rank upon General G. W. Smith.

There was great confusion and discouragement in the rebel councils. Jefferson Davis found hope in the suggestion that "the enemy might withdraw during the night, which would give the Confederates the moral effect of a victory." Early on June 1 the battle was renewed, and the Union troops reoccupied the ground lost on the day before. At 2 o'clock General Lee took command, and the battle died away by the gradual retirement of the Confederates.

A great battle had been fought absolutely without result. The Confederates had failed in their attempt to destroy McClellan's two outlying corps, but their failure entailed no other consequences. The losses were frightful upon both sides: the Union army lost 5000, and the Confederate loss was reported at something over 4000, which is generally considered an under-statement. But there was this enormous difference between the condition of the two armies: the Union troops south of the Chickahominy, though wearied by the conflict, with ranks thinned by death and wounds, had yet suffered no loss of *morale*; on the contrary, their spirits had been heightened by the stubborn fight of Saturday and the easy victory of Sunday. North of the river lay the larger portion of the army, which had not fired a gun nor lost a man in the action. It is hardly denied, at this day, by the most passionate of McClellan's partisans, that the way to Rich-

* In an article in THE CENTURY for May, 1885, General Johnston changes this statement to "twenty-two out of twenty-eight brigades."

mond was open before him on Saturday afternoon. It was his greatest opportunity.

Jackson was in the Valley of the Shenandoah detaching from Lee an army of 16,000 men. The enemy had thrown almost his whole force against McClellan's left wing, and had received more injury than he inflicted. Our right wing was intact; the material for bridging the upper Chickahominy had been ready for three days; the Confederate army was streaming back to Richmond in discouragement and disorder. Even so ardent a friend of McClellan as the Prince de Joinville writes:

The Federals had had the defensive battle they desired; had repulsed the enemy; but arrested by natural obstacles which perhaps were not insurmountable, they had gained nothing by their success. They had missed an unique opportunity of striking a blow.

If General McClellan had crossed his army, instead of one division, at the time that Johnston's entire force was engaged at Seven Pines,

* The repulse of the rebels at Fair Oaks should have been taken advantage of. It was one of those "occasions" which, if not seized, do not repeat themselves. We now know the state of disorganization and dismay in which the rebel army retreated. We now know that it could have been followed into Richmond. Had it been so, there would have been no resistance to overcome to bring over our right wing. [General Barnard]

Mr. William Henry Hurlbert, the translator of the Prince de Joinville's work, who was in Richmond during the battle, gives the following account of the condition of the Confederates on the morning of June 1:

They were in a perfect chaos of brigades and regiments. The roads into Richmond were literally cov-

ered with stragglers, some throwing away their guns, some breaking them on the trees, all with the same story that their regiments had been "cut to pieces"—that the "Yankees were swarming on the Chickahominy like bees," and "fighting like devils." In two days of the succeeding week the provost-marshal's guard collected between 4000 and 5000 stragglers and sent them into camp. Had I been aware on that day of the actual state of things upon the field, I might easily have driven in a carriage through the Confederate lines directly into our own camps. It was not indeed until several days after the battle that anything like military order was restored throughout the Confederate positions. Appendix, p. 113.

"AS A BELL IN A CHIME."

As a bell in a chime
Sets its twin-note a-ringing,
As one poet's rhyme
Wakes another to singing,
So, once she has smiled,
All your thoughts are beguiled
And flowers and song from your childhood are bringing.

Though moving through sorrow
As the star through the night,
She needs not to borrow,
She lavishes, light.
The path of yon star
Seemeth dark but afar:
Like hers it is sure, and like hers it is bright.

Each grace is a jewel
Would ransom the town,
Her speech has no cruel,
Her praise is renown;
'T is in her as though Beauty,
Resigning to Duty
The scepter, had still kept the purple and crown.

OUR NATIONAL MILITARY SYSTEM.

I.—WHAT THE UNITED STATES ARMY SHOULD BE.

BEFORE submitting the following suggestions in regard to the possibilities of the future army of the United States, I will state some facts that pertain to the army as it exists to-day.

The law fixing the peace establishment of the army, passed in 1869, limited the strength to thirty thousand. The annual appropriation bill has of late years contained a proviso that no money thus appropriated shall be used for recruiting more than twenty-five thousand men. The cost of keeping up this force has always exceeded \$30,000,000 and has often amounted to \$40,000,000. The men enlisted for this force are mostly recruited in the large cities, and consist of a class who in the main have selected to enlist from other than patriotic motives or love of the military profession. A large proportion are foreigners who are not sufficiently acquainted with the country to find other employment. Many have found out their incapacity to make headway in civil life, the causes being as different as the characters and circumstances of the individuals. Too many belong to that large and unfortunate class known under the generic name of "tramps," who are wanderers by nature and who become the deserters from the army. Many are illiterate, few are educated and capable, and the great majority lack the necessary talents and capacity to take care of themselves and to advance in life. The smart and apparently capable man, when found in the ranks, is generally suspected of some moral taint or intemperate habit not tolerated among his friends, and the number who attain distinction in the army, or after leaving it, are few indeed. There is no opportunity afforded the enlisted man to become qualified to command in case of war, and the number who rise to a commission is remarkably small.

The law permits original enlistments from sixteen to thirty-five years of age. Reënlistments are not restricted by age, and can take place so long as the examining surgeon finds no objection. The duration of each enlistment is five years. The number of posts garrisoned by the regular army is about 125. They are scattered throughout the territory of the United States, and the duties of the troops occupying them are mainly confined to the simplest rou-

tine of garrison life, such as guard duty, target practice, and company and battalion drills. Their time is taken up in rehearsing these elementary lessons over and over, doing them as well, if not better, after the first few weeks of instruction as they ever do afterwards. This is the experience and attainment of the larger portion of the enlisted men. On the frontier there are occasional outbreaks of the Indians in the vicinity, but they are yearly becoming less frequent. When an outbreak does occur the troops have an opportunity to learn a little field service. This humdrum condition is less true of the cavalry than of the other two arms of the service, because the care and instruction of the horse adds a material task to the duties of the trooper. But his duties are also confined to a narrow sphere, and the training of the enlisted men of the army is limited to taking care of themselves and performing the elementary duties stated above. There is no provision for elevating the rank and file, no means held out to the soldier, to enable him to rise in the profession of arms, and the longer he remains in service the more incapable he becomes of taking care of himself out of it. The great majority go through their first enlistment of five years making little or no progress after the first year, and when they are discharged, if they do not reënlist, they settle down on a homestead or in some frontier village, and are lost to the country, so far as any further military service to be derived from them is concerned. The most valuable service they have rendered is the opportunity they have afforded the commissioned officers to practice the administration of army affairs and to acquire the care and command of troops. Those who reënlist simply repeat this experience, and make no material progress. They may be good enough soldiers in case there is any actual service in the field to do, but all that they have acquired is limited to the individual.

While military knowledge is fairly maintained and practiced in the army, there is no provision for disseminating it, in order that we may have as many men as possible throughout the country who are themselves instructed and who are capable of giving instruction to others in the event of a war. If proper men were selected at the proper time of life, and the proper training furnished them, with such an end in view, they would at the end of five years' service be able to take a company

into the field and instruct others to do the same.

The annual cost per man of maintaining our military establishment is about \$1200. Surely at such a cost a much better result could and should be obtained. It is evident that, by the methods which are in use in the army at present, we get only a minimum return for this sum. According to the foregoing calculation, it costs more to maintain a private in the United States army than it does to make an officer at West Point. Can there be any doubt about the relative value of the two to the country? No enlisted man, be his abilities what they may, can hope to compete with a graduate of the Military Academy, through such opportunities as are furnished at the present time in a five-years' enlistment. This is due to the fact that the material in the ranks is incapable of acquiring the necessary knowledge, even if it were furnished, which it is not. Besides, a large percentage of the rank and file are morally disqualified for higher and responsible positions, as may be shown by the number of desertions from the service. A large percentage are professional deserters, as was shown by the number of men in the ranks who claimed the benefit of the President's proclamation in 1873. At that time nearly one-third of the enlisted men confessed themselves deserters. There is no means at present by which this class of criminals, or any other, can be kept out of the ranks. With the history of the Academy before us, can it be doubted that we can, and should, get much more for the money expended than we do? Since 1870, when the army was reduced to its present strength, the cost of maintaining it has been, on an average, about forty millions a year. For this sum 100 West Point Academies could be maintained, educating 30,000 students, and graduating annually from 5000 to 7000. Would not the substitution of the method of making officers for the one of maintaining enlisted men, since it can be done cheaper, give the country a much greater military strength, in the event of a war, than any result that we get out of the army as it is now constituted?

Some of the defects of our military system, or rather want of system, have here been pointed out, not with the view to finding fault, but to aid in suggesting where improvement is needed. The defects cited will not be questioned by any officer of sufficient experience, for they are easily deduced from the official reports made from time to time. The Lieutenant-General of the army, in his last annual report, states, in reference to desertion, that there is a slight increase over the previous year, and that it is likely to continue. The

army, notwithstanding its defects, due to mismanagement and unwise legislation, has done good service whenever it has been called upon, and has amply repaid its cost, in proof of which the history of the growth and settlement of the great West in the past half-century will fully testify.

But the nature of its duties are destined soon to change, and we must change our methods to meet the new conditions. The Indian question is fast being settled so far as requiring a military force, and will be soon so insignificant as to be disregarded in military legislation. Soon the sole duty of the army will be the preparation, conservation, and dissemination of military knowledge, and keeping pace with the progress of military science, in order that the country may not invite war by being unprepared for it. Our geographical position relieves us of the great expense of maintaining a very large standing army, for we have no large standing armies on our borders. But we cannot afford to neglect to provide ourselves with the means and material for war, for the reason that being prepared is the surest means of preventing war; not to be prepared is simply to invite it. So long as the great nations of the earth maintain immense armies and foster the art of war, we must do the same. China, the most populous nation on earth, is at the mercy of any third-rate power, simply because in her civilization she has paid little attention to the art of war. If China had given the same attention to the subject that the Western nations have, she could with her population control the world.

The ideal army that we have in view is an educational institution, the fundamental principle being to recruit its material from the youth of the land, who will be able to learn the duties of the service and to impart them to others. To furnish the necessary field for the extension of their knowledge, and to give the entire country the benefit of it, the recruits should be selected *pro rata* from the congressional districts, to which they would be returned when they had completed their education.

Every military post should be a military school. A liberal construction of section 1231 of the Revised Statutes would enable this to be done without further legislation. The authorities, however, have been unfavorable to this idea in so far that they have ruled that a soldier cannot be compelled to go to school. It is difficult to understand the position of General Sherman on this question, in view of the support he has given to the schools established at Fort Monroe and Fort Leavenworth. The Adjutant-General and the Inspector-General have also advocated this view, and maintained that further legislation is necessary in order

that soldiers can be compelled to go to school. Unquestionably further legislation is necessary, if the general of the army and his staff so maintain. The law of obedience seems sufficient to exact nearly everything else from the soldier, and it is not easily understood why he cannot be required to learn everything that will make him more useful to the service. There would be no difficulty in the way if the Commander-in-Chief or the War Department should make a rule requiring soldiers to attend school. General Sherman has declared in his annual reports, while in command of the army, that the above-mentioned schools have added nothing to the current expenses of the army. If this is so, then every post could be converted into a military school, without increasing the annual appropriation. The schools referred to are for officers, and not for enlisted men, but whether the attendance of officers is voluntary or compulsory has not yet been made apparent. Neither is it self-evident that they are more necessary for the officer than for the enlisted man. An officer's commission is given him on the theory that he has received his commission because he is already familiar with the subjects that are taught at these schools, and illustrates another serious defect of the service; viz., the tendency to repeat and revive over and over again what has once been thoroughly learned. It would not be deemed advisable for a graduate of the Military Academy to be permitted to return to West Point to go over the same course again even once, to say nothing of continuing the repetition. Yet a large percentage of the duties of the service is nothing more than repetition. Take the matter of target practice and drill, which is carried to such an extent that it often becomes detrimental instead of beneficial. Why compel men to do a thing that has once been learned until the monotony of the repetition destroys interest and makes it truly distasteful. Every graduate of the Academy will concede that the repetition of the whole course of infantry tactics three times annually is one of the greatest trials of the course. Target practice has been conducted to such an excess that officers and men have been outspoken in their condemnation of it, and have brought about a reduction to a reasonable limit. After a man has once learned to shoot, it is expensive, besides being detrimental, to require him to shoot for weeks and weeks. The principle of taking up some other subject useful in the profession would be more conducive to the interests of the service, and less irksome. It is not maintained that practice should be dispensed with entirely after a subject is once acquired, but that it should not form the sole occupation of troops, to the ex-

clusion of every other duty, as drill is sometimes made to do. Too much importance is attached to drill tactics. When the sword and pike and the bow and arrow were the essential weapons of war, the formation of ranks had its origin, and developed into masses and an elaborate and complicated manual. With the introduction of fire-arms the thinning of the ranks began, and has continued with the improvement in arms until it is simply disastrous for any force to be surprised in solid formation, where formerly the reverse was the case. The complicated drill, which is having a tendency to simplicity of late, was devised by the sovereigns of large armies to furnish occupation for the troops in time of peace, who if not kept busy would soon engender trouble.

We are disposed to adopt the customs of European nations without taking into consideration why they exist there, and the possibility that they are not necessary in our country. So long as the French nation was considered the first military power in the world, we used French tactics and wore French uniforms. When the Germans conquered the French, we donned the helmet. We adhere to rigid lines in ranks and drills, and to unnecessarily complicated systems, when every officer of experience knows that they have no value and are not used in actual warfare. A member of the National Guard is liable to think that he knows the whole art of war if he can take the prize at a competitive drill or a target practice, on an armory floor and with an unobstructed range. In actual war he would not be able to accomplish the facings in a plowed field any better than the volunteer of a few weeks, and the accuracy of his fire would be materially affected by the unfamiliar ground and the knowledge that there was an enemy who might fire first. Modern warfare is influenced in a greatly diminished degree by what remains to us of the tactics of Frederick the Great and his time. All that is ever used of the endless drilling, when in actual campaign, is the passing from column into line and from line into column by the simplest methods, and no other movements, no matter how favorable the ground or how perfect the drill. The precision required in drill takes away from the soldier what is of the first importance in modern warfare—*independence of movement, freedom of action, and that individuality which belongs to every man whether in or out of the ranks.* We must progress with the changes that attend military science, and the improvement in weapons to which the old formations are no longer applicable.

During times of peace the instruction of the army in most of its duties should be confined

to learning *how* to do them, and to *do* many of them only for the purpose of learning *how*. In the conduct of war there is ample time for practice of all its requirements if the knowledge exists as to how it should be conducted. Constant and unremitting exercises for the purpose of being ready for war that comes so seldom is really a waste of time and strength. The great precision in firing that is attained by so much hard work is lost as soon as the practice ceases.

With each post organized as a school and graded for each arm of the service, and the recruits classed at depots according to capacity and progress already made, they can be assigned to their proper place to begin the contest for the prizes that should be held out for all. There should be something for each and every man to work for. The young man who has nothing to work for is without a very essential qualification for a soldier; and the service that holds out no adequate reward to the industrious and efficient worker in time of peace, nor to the gallant and successful man in time of war, cannot hope to have an efficient and trustworthy army. The system of service should be so arranged that the sifting and promotion will, in the course of the enlistment, place each man in his proper place according to his merits, both as to services and to acquirements. For the inferior and refractory material that would undoubtedly find its way into the service under the most rigid scrutiny one or two companies could be assigned in each regiment, to which these men could be transferred and made to do the rougher and more disagreeable work, to the relief of the better men.

While holding that the army should be an educational institution, it is not intended to limit it to book knowledge. The instruction should also be technical to a certain extent. There will be many who will not take to books who can be of great service as carpenters, wheelwrights, blacksmiths, masons, painters, etc.; — these are all trades which can be taught, for they are all carried on at every post. All these pursuits are essential in war; in fact, there is no pursuit in civil life that may not be of service in war. The ax and the spade were as valuable as the musket in the last days of the rebellion.

Many officers of the army will be averse to the introduction of mechanical and industrial work into the military service, as improper and unnecessary. There has been much written and said against the working of the soldiers, it being claimed that it is one of the objectionable features of the service that so much manual labor is required of the men, and that it is incompatible with military duty. This will readily

be met by changing the status of manual labor in the army and making it a military duty as well. The management of working parties can be utilized as a means of discipline as well as drill, and with much greater utility to the service and the soldier. There will be no difficulty in doing this, for the importance of skilled labor under military control, applied to military affairs, can readily be shown; and whether war comes or not, its utility remains, especially as we are supposing the army to be composed of a younger and superior material.

The Military Academy would furnish the instructors for these post schools, and the various branches taught there could be carried on to a greater or less extent at all military posts, without additional increase of the current expenses of the army. In the course of a five-years' enlistment the progress which each man would make would be in proportion to his application and capacity and the opportunities afforded him. That education of the rank and file would be beneficial to the army will hardly be questioned. Yet many officers will be found who will oppose the plan of making the army an educational institution, on the ground that it would never be ready for immediate service. It is possible that if education should be made the important feature that its importance demands, the necessity of being ready to move at a moment's notice might be lost sight of in a measure, but there is nothing in the system here suggested that would prevent the most complete preparation for any emergency. It would, however, be quite sufficient to teach the army how to be ready. As has already been stated, it is a great waste of energy for the army to be maintained in constant readiness for what comes so seldom, and rarely comes so suddenly that preparation cannot be made if the means and knowledge exist to get ready. It is the supplying of the means and the knowledge that is here advocated.

In order that the proper material for the army may be provided, it will be necessary to change the methods of the recruiting service. It should be the duty of that branch of the War Department to procure the recruits from the youth of the land, from all parts *pro rata*, in order that all sections of the country shall be represented; when the enlistments expire, the young men, with the knowledge they have acquired while in the service, should be distributed as widely as possible. They should be young men, preferably eighteen and certainly not over twenty-five years of age. Selecting them from congressional districts, the present strength of the army could be maintained by obtaining fifteen recruits annually from each district.

The prevailing rule should be one enlistment, in order that the greatest number possible may get a military training. Five years is ample time in which to produce good results. The young man who could not in five years qualify himself for an officer under a system with that end in view, would not be likely to do it by longer service.

If an education, in addition to the pay, clothing, and subsistence, could be held out, there would be no difficulty in getting the necessary young men. There is little doubt that, when such a plan should become known and established, it would be necessary to make the selections by competitive examinations. The prospect would be very inviting to a large percentage of the young men of the United States, for the number of those whose ambition is greatly in excess of their opportunities is very large. The opportunity of getting an education while one is being clothed and fed, and receiving from fifty cents to one dollar per day, would be availed of gladly by any young man who had not been favored by fortune. It would be his chance to see something of the great world. After five years he could return to his home and relatives with a diploma and a discharge that would give him a claim to a commission as an officer in the event of a war, and he could have from one to two thousand dollars in his pocket; for he could save all his pay, as he would have little time to spend it if he applied himself closely to his duties. Many armies of young men, larger than the United States army to-day, are longing for such a start in life.

The expense of the army graduate would not be lost to the country even if a war did not occur during the available life of such graduate. He would be utilized in the local military organizations, and his savings would enable him to make a beginning in such civil pursuit as he might desire to follow, if he had not acquired a trade during his service. He would take a place and position among his friends and kindred corresponding to the standing his abilities and application won for him in the army. A very large percentage of the pay of the enlisted men of the army, which is now spent in saloons and gambling establishments, would be brought home by the discharged men, to be usefully spent among the people — an economic feature that would be of great value in time, for it would be a constant and continuous addition to the wealth of the congressional districts from year to year; not in money alone, but also in educated and well-trained defenders of the country. At the end of five years there would be in each district about seventy-five graduates from the army, from among whom a sufficient number of officers

could be obtained to instruct any number of volunteers that would probably be called for from the district in the event of a war. With such a body of competent instructors, the volunteer service could be placed in better condition for the field in thirty days than was attained during the first year of the war of the Rebellion.

This plan would provide from twenty to twenty-five thousand instructors every five years, and place them where they would be most needed. An army of half a million of men will require at least fifteen thousand officers. When war comes in this country, the first necessity is a sufficient quota of competent officers. By the foregoing plan there would be a permanent source of supply to select from, possessed of the most recent information on the subject of the care and management of troops.

Our form of government being different from that of all other great nations, our military system must be modified to suit it. We raise our armies by calling for volunteers, and without the approval of the people no war could be got on foot by the Government in this country. For this reason our military methods should be popularized as much as possible, in order to have the sympathies of the people. We have no military system whatever. The militia laws looking to that end, which were devised in the early history of the United States, have failed of their object, and are a dead letter on the statute books. When war comes we shall be as unprepared for it as we were when the Rebellion came upon us. We shall be obliged to resort to the same expensive methods, and suffer the same humiliations in the beginning that the country has heretofore experienced. Great as were our resources, we could make no headway in the first year of the rebellion, because the great body of the people were ignorant of the means and methods of carrying on war, and there were not a sufficient number of instructors provided for such a contingency. In another decade there will not be left a military remnant of our last experience that could be utilized, for the improvement and changes that have been made in the means of warfare will require new and original adaptations of our resources. The object of this paper is to suggest the best possible preparation that the amount of money we annually appropriate could accomplish.

The limited force scattered throughout the United States that we ostentatiously designate as our standing army is smaller than that of any other country in proportion to its population, except China. While France has a soldier to every 60 inhabitants, we have one in 2400. By some extremists, who hold that a standing army is not consistent with a republican form of government, this insignifi-

cant force is sometimes accused of threatening the liberties of our people. It is a misnomer to call an establishment that bears such a proportion to the population a standing army. It is nothing more than the custodian of what military knowledge exists in the country. This is a heavy responsibility, which should be aided by making it also a producer and disseminator of military knowledge, in order that it may have the opportunity of rendering an adequate return for the immense cost it is to the country.

It is necessary that the people at large should see and appreciate the importance — if not the necessity, at least the economy — of utilizing the army as has been outlined in this paper. The army of the present day is conservative and not disposed to radical innovations. The War Department could do much to put the army in the way indicated; but, in view of the opposition of the high authorities

cited, it will be necessary for Congress to direct what should be done. That august body is also slow to act without being stimulated to action by the people.

Every friend of the army who has the interest of his country at heart, and sees the necessity for maintaining the greatest possible military strength at the smallest cost, must appreciate any plan that will provide for the production of military knowledge and its dissemination among the people, for it is the primary element of national defense. It is believed that the foregoing plan is in accord with our institutions, and that when fully understood by the people it will be accepted as the most practical and economical means of fostering and developing the greatest national strength, of engendering patriotism and the love of country, and will tend to the preservation and perpetuation of the Union.

August V. Kautz,
Brevet Major-General, U. S. Army.

PORT NIobrARA, NEBRASKA, July, 1888.

II.—MILITARY EDUCATION AND THE VOLUNTEER MILITIA.

A VERY important element in the national defense, when the nation's peace is threatened, must be the character of the troops which will compose her armies, and the means which must be relied upon to call them from their homes to the battle-fields and to change them as quickly as possible from an unorganized body of citizens into an efficient and victorious army. First in importance is the character of the material upon which we have to work. Grant said of a prominent Union general, "He perhaps did not distinguish sufficiently between the volunteer who enlisted for the war and the soldier who serves in time of peace." There are a great many officers who make the same mistake. The volunteer soldier, who in time of the nation's peril enlists for the war, is often a man in comfortable circumstances, of competence or even wealth, and his enlistment is a pecuniary sacrifice to him. He is often a man of social position, surrounded by friends who regard and esteem him, all of which he fully appreciates. Patriotism and the hope that by honorable and perhaps distinguished services he may still improve his social position and popularity are the motives of his enlistment. They infuse him with energy and prompt him to heroic deeds.

As a rule a member of the National Guard or State Militia is a man of good social standing. He has usually some military taste, inclination, and ability. All the time he gives to his military studies and training is at a sac-

rifice of his private interests; and consequently he desires to accomplish as much as possible in the shortest space of time. There is nothing mercenary in his motives, for the pay and allowances he receives are never equal to his outlay of money, taking no account of the time he gives.

The chief pleasure he derives from his service is in the gratification of his taste for military knowledge, the satisfaction he takes in his military exercises and the excellence of his attainments, the knowledge that he is in a position to defend his country and society promptly and well, and the increased regard and esteem he merits from his countrymen. He has independence of character and is self-reliant, strong, and intelligent, and frequently is a man of broad and liberal culture and the strongest sense of personal honor, dignity, and self-respect.

This is the kind of men who must constitute our volunteers in time of war, and we must rely especially upon such to rouse the people to patriotic action and to lead them forth in the defense of the country in time of peril.

The nation having secured the volunteer, the next step is to convert him into a soldier in the shortest possible space of time. To this end the most difficult and at the same time absolutely indispensable thing is to induce him at all times to submit his judgment, in matters requiring action, to that of his commanders, and certainly and surely to obey the

orders of his superior officers in the most prompt and exact manner. This result is obtained in two very different ways, owing to the character of the material of which the soldier is to be made; and it is exceedingly important that the difference in the two systems should be understood, that the method may be adapted to the character of the material. One system is based upon a cringing submission to and personal dependence upon superiors. Under such discipline men soon cease to be men and become mere machines. The kind of men who constitute the majority of our volunteer armies, and especially of the National Guard, do not yield to these measures. Three or five years is not enough in which to teach them to cease to reflect: so short a time is not enough in which to destroy the enthusiasm with which they enlisted, or to cause them to lose their independence of character and to cease to think for themselves; and we are all glad that it is not.

It seems to me that in our United States army and Military Academy the tendency has been, and still is, too much to seek the wrong foundation for discipline, and the more intelligent, patriotic, and self-respecting class of men have been deterred from enlisting in the regular army; and many of the best men, of the noblest impulses, who do enlist are no doubt by this cause moved to desert without being willing to give their reasons, fearing the ridicule of their companions and officers who do not sympathize with them in their ideas of personal dignity and self-respect.

Aristocratic theories are impracticable in a volunteer army of free citizens, and still more so in the National Guard. Some of the very best National Guard companies, which would have obeyed the military orders of their officers, even at the risk of their lives, with an eagerness, exactness, and self-devotion that could not have been excelled, have sometimes been discouraged, their self-respect wounded, and their ardor destroyed by an unwise and foolish attempt of their military superiors to carry their superiority beyond strictly military matters, into the social life of the command, and to make their men feel that the subordination extended not only to things military but to all things, and was personal rather than official. Such companies only await the expiration of their enlistment to leave the service, with the advice to their friends—which, contrary to the ordinary rule, is sure to be taken—never to enter it. The loss of such men is absolutely irreparable. The decline in discipline and efficiency in many commands of the National Guard may be attributed largely to the loss of such men, their places being supplied by others of inferior character. If this process should be general and should continue, the

decline and ultimate extinction of the National Guard would be inevitable.

A subordination that is attempted to be made instinctive by basing it upon an exaggeration of the personal, social, and assumed inherent inferiority of the enlisted man, besides preventing the best enlistments, can only, where a free citizen is concerned, be made efficient by long years of effort—longer than any war is likely to last; and therefore this kind of discipline, while it may answer in the armies of aristocratic countries, is not the best in a free country. Fortunately the foundations of a better are ready at hand, and it is not necessary to change the character of the man in order to make of him a good soldier.

For the aristocratic idea we should substitute that of properly constituted authority, a love of law, order, and system, fidelity to duty, pride of good citizenship and of military and chivalric qualities, and an intelligent and full explanation of the absolute necessity of silence and strict obedience at all times, in order to conquer—supplemented, as in other cases, by real merit and proper example in the superior. By proper instruction on these subjects, addressed to the soldier's intelligence, a better discipline can be developed in the volunteer army, and especially in the National Guard, and in a very much shorter time than can possibly be done by the aristocratic method. And when at the close of a war such a soldier again becomes a free citizen, he is a better one than before, and in mind, principles, and habits is in full accord with free institutions.

This is the reason why the soldiers of the volunteer armies so quickly, so naturally, and so completely returned to their civil duties, after four or five years of active military life, to the great surprise of those whose ideas had been formed by contemplating the result of the disbanding of armies governed by the aristocratic principle.

It would seem best in a free country in time of peace to use, so far as possible, that basis of discipline best adapted to the volunteer armies in time of war. Any system may answer when but little strength is required, and that one should be selected which, with the least change, would give the greatest strength in the time of the greatest trial.

Some system should be adopted by which men should be instructed in the nature of military subordination as distinct from social. When this is done, the work will be much facilitated. This system should be developed as much as possible before a war occurs, and is an important part of the preparation for the national defense.

Persons who have formed their opinions upon matters of discipline by observing armies

governed on the aristocratic principle are apt very much to underrate the value of the subordination and discipline of the National Guard and volunteers, on account of the freer intercourse between inferior and superior and the apparent disregard for ceremony and forms to be noted in the ranks of the latter. It is difficult for them to believe that a man who does not stand at "attention" in the presence of an officer is nevertheless fully prepared to obey his orders to the utmost; but such is often the case.

The National Guard of the States is a sort of cadet corps from whose rank and file general and field officers are likely to be evolved in case of war, as has often been done before; and it is generally admitted that the more intelligent an officer is the more efficient he will be. It is likewise true, though not so universally admitted, that the same rule applies to the private. In thousands of ways, such as in making the most of his few comforts and in taking care of himself in camp and field as well as in battle, the private soldier's efficiency is largely in proportion to his intelligence.

So much for the education of the republican soldier in military discipline. The soldier of the Republic should also differ from the soldier of a monarchy in this: he should be of the people, for the people, in close relation to and in sympathy with the people, and should continue to be so well acquainted with them, and they with him, that they and he may have the fullest confidence and esteem for each other. In monarchies the soldier is the fighting instrument of his sovereign, who often desires that he should *not* sympathize with the people.

In selecting material for soldiers from among the people, it is best that the culling process should go on from youth up. The youths at colleges and high-schools should have an optional class in military tactics and drill. It would not be without profit to all if it were made compulsory, as it is in Switzerland, for the time would not be wasted if the individual should never become a member of a military organization. The physical development and the muscular and mental training resulting from an elementary course in military tactics, drill, and exercises would be ample compensation for the time and money spent, and probably would be as useful to the learner in after civil life as his Latin, French, or algebra, and possibly more so. Boys and men having a military bent or inclination would naturally seek schools where such advantages were offered in connection with their other studies, and so of higher schools and colleges. He who had a special talent would be most likely to go farthest in this direction, and he who found that he had

no taste or ability of this kind would more easily take some other profession without any sense of disgrace to himself or friends in doing so. In this way the selection of the fittest would be continually going on in the most natural way possible, just as in the other spheres of life. Appointments to the regular army and to the Military Academy could then be made from among those who had distinguished themselves by special natural fitness and by special attainments. The West Point Academy should have its doors thrown open wider, so that any one who might be willing to subject himself to the severe discipline there practiced for four years, under penalty for desertion, could enter, and students on graduation should not be promised commissions in the army or required to take them. This change, it is believed, would not injure the discipline at West Point. Experience teaches that it is not the students who are of their own will striving for an education who are insubordinate at college, but those who have their education thrust upon them by doting friends.

Likewise every inducement of honorable mention, or otherwise, should be offered to men of proper natural attainments and qualifications to enter the standing army and to remain as long as they can feel enthusiasm for their work; and when they practically cease to learn they should be allowed and encouraged to resign and to seek employment among the people in the kindred professions or occupations of peace, as did Grant, Sherman, McClellan, Schofield, Rosecrans, and others, thus giving place to other young men who would be glad to spend a few years in preparing themselves to defend their country if occasion might require. It is not probable that Grant, Sherman, and McClellan lost anything of efficiency by their years of civil employment, but rather gained. It placed them in positions where special effort and ability would produce for their possessors special results, and so increased their energy, their tact, and their mental resources and enterprise. It brought them into closer contact with the people, and so increased their knowledge of the peculiar character and quality of the material of which were composed the volunteer armies of the Republic, which they afterwards so gloriously led.

Men should not always be in school, and that is what military life might well be called in time of peace: it is a preparation for work to be hereafter done when the nation's strength is tried.

It is not recommended, at least for the present, that there should be a compulsory rotation in the army. It is only proposed that resignations of officers after a few years' ex-

perience should be freely accepted and encouraged, and that they should be allowed to return to the body of the people, in order that other officers may receive commissions in the army for short periods, or may receive commissions which they would be permitted to resign as soon as they too had received some experience. Some officers might remain permanently in the army to preserve its traditions, as professors remain in colleges while students come and go. Under such a system of military preparation men of military experience and education living in civil life among their neighbors and countrymen could in a short time gather together their friends and acquaintances, whom they would know, and who would know them, thus giving mutual confidence, and could lead them to the defense of society and of the state and nation more promptly than it could be done in any other way; and this would make a strong nation without the expense and disadvantages of a large standing army.

In a free republic the military force always has been, and always will be, in the body of the people. It cannot be permanently otherwise: where the ultimate force is, there is the sovereignty. All institutions and orders and all laws exist by sufferance or direct command of this ultimate force. This has been recognized by all our great statesmen, and they have shown their belief by urging the necessity for training the people to arms, in the form of a well-organized militia. They have embodied their principles in our constitutions, state and national. The practice in the earlier years of the Republic of seeking to train all men physically capable, if ever justifiable, has long ceased to be so, because the number of such men, being about seven millions, is so large that the training of all is entirely unnecessary. It would involve an enormous expenditure of money. It would compel men to drill who have no aptitude for military affairs. They would not succeed, and they would be a hindrance to the others. It would be irksome to them, and they would use their efforts to break up the system. It would also prevent the natural process of selecting the fittest, which results where only one in fifty or a hundred is trained, and only those who from an instinct of fitness volunteer for the purpose.

The officers in the volunteer militia are selected, and should be, from men whose attainments, abilities, and experience make their time most valuable to themselves as well as others.

It would be a good thing for the National Guard if some part of the five thousand enlisted men and officers, which the Adjutant-General recommends should be added to the regular

army, should be taken from the National Guard by enlistments and commissions for a short period of service — of three or six months, or even a year. The candidate for such a service should be required first to pass such an examination by an army board as would show him to be reasonably well qualified by nature and attainments to at once assume the duties that his new position would impose upon him. At the military posts where the National Guard men serve there should be a school for officers and enlisted men, where the duties of the various positions should be intelligently explained and illustrated by officers detailed for the purpose, in which these citizen soldiers might make the most of their time while in the army. These short-term men and officers might perhaps be required to discharge all duties, so far as might be deemed practicable, that are required of others of their rank in the army. They should be enlisted or commissioned in the army, and for the time being have nothing to do with the National Guard. That kind of discipline in the army which is based upon personal dependence might be slightly impaired by this practice, but the best discipline would not be to any considerable extent; for if the right persons were selected, it would be those who were most desirous of learning true discipline.

In order to secure a more general instruction the National Guard should go into camp from six to ten days each year, and it should all go into state camps, under one commander. There is a very great, very beneficial, and almost indispensable influence in converting men into soldiers — in the promotion of discipline of every sort, in army-making as distinguished from mere teaching — to be found in having soldiers do duty in the presence of others, and having other soldiers do duty in their presence. Each one learns that he has a duty that he himself must perform, and that others have duties with which he must not interfere; and the latter is almost as important as the former. By seeing other soldiers faithfully performing their duties without swerving to the right hand or to the left, by seeing perfect order prevailing and everything being done by the right person and in the right way and at the right time amidst so large a number as to make this utterly impossible without military discipline, the *esprit de corps* is engendered, and the feeling strengthened that the whole army is a unit, and each part, while attending to its own duty, can rely, without the least nervousness or distrust, upon all other parts attending to theirs. A soldier may and will have his private personal friends with whom he talks and in whom he confides. As a soldier he should know other soldiers simply as such, ac-

cording to their rank, position, and duties, without reference to the personality of the man. This is more easily learned where the soldier is brought into contact with soldiers of whom he knows nothing but their rank, position, and duties, except that they are honorable members of his own army, and as such are always worthy of the utmost confidence as soldiers, from a soldier. These things can only be learned by having large bodies of troops together under trusted and competent officers, and they must be learned or there is no real army. It is these feelings, felt to be so strong and so deep by the veteran comrades of many well-fought campaigns, that make old soldiers so confiding, so trusting, so partial to one another through all their after life. These things constitute the indispensable essence of the army; and without them there can be no army, no matter how many otherwise good soldiers there may be. It is only when these things are too much overlooked, undervalued, or misunderstood, and when too much relative importance is attached to the mechanical execution of the drills and ceremonies, that small camps are preferred to the largest possible.

In States where there is a well-organized National Guard, a commission might be appointed consisting of four or five officers selected from the National Guard, and as many more detailed from the regular army, including such professors of military science as might be serving in the colleges of the State. This commission might examine such officers and non-commissioned officers as desired to be examined and such as might be ordered before it, and grant diplomas showing attainments in

the various branches of military art and science. Such an institution to be of any value must have its expenses, including pay of officers who compose it and transportation and subsistence of officers attending it, paid by the State. In this event a healthy demand would be created for the service of such regular officers as could be secured from the army and the military colleges during the annual encampment, to conduct officers' schools and non-commissioned officers' schools, and to assist and coach the various officers in the discharge of their duties generally. It would not be well for any one to supersede commanders as the proper instructors of their own troops; but commanders would be glad to avail themselves of the assistance of better-informed men, and would be profited thereby. In this way the services of several officers of the regular army would be extremely profitable, if they could be obtained during the annual encampment of each brigade.

If something of the plan here suggested were gradually adopted, it would have a tendency to put many graduates of West Point and some ex-army officers with their technical knowledge into the National Guard, and some of the most military of the National Guard officers might find their way into the army, carrying with them their practical knowledge of the character of our volunteers. It would bind together in one bond of sympathetic union the Military Academy, the Army, and the National Guard, greatly strengthen the military power of the nation, and foster that sentiment so necessary in a republic of liberty governed by law.

James Montgomery Rice,
Lieutenant-Colonel, Illinois National Guard.

III.—COMMENT ON COLONEL RICE'S PAPER.

COLONEL RICE'S paper covers many points on which opinions naturally differ. It is a wholesome sign that so much attention is being paid by thoughtful men to the necessity of providing for our national defense by a more thorough organization of the militia of the several States, and it is from a comparison of their opinions that the best method is to be selected.

Wars nowadays are speedily decided, and a nation not prepared to protect itself will be conquered before it can organize and train its natural forces so as to render them effective. With our absurdly small regular army, it is to the National Guard of the various States alone that the country must look to supply the regimental and company officers who are to command the volunteers who are to protect it in time of war. No pains, therefore, should be spared to make their military education as thorough as is possible under the peculiar circumstances of their services.

The foundation of a military organization is disci-

pline. I do not think it possible to have in a militia regiment the rigid discipline of regulars. But while not carrying "class distinction" too far, it is perfectly possible to require the men, *when in uniform*, to conform to rigid rules in regard to the respect to be paid to their officers and to the forms of ceremony, etc., so as to impress upon them the maxim "that obedience to authority lies at the foundation of military efficiency." This is done regularly at the New York State Camp, and the better the regiment the more pride its members take in observing these matters.

The great point to insure obedience—and one upon which particular stress is laid by German authorities—is to impress upon the men that their officers will protect them from all unnecessary labor and danger; "for when the men know this they face hardship and danger uncomplainingly, knowing that it is inevitable." This involves, of necessity, that the officers should be taught how to care for their men; and here, therefore,

is where the National Guard officer is weak, because uninstructed.

I doubt whether it would be possible to throw open the doors of West Point as proposed, without injuring it. The cadets are now paid and supported by the country. If there were many more, it would cost too much. Besides, the present wholesome regulation which draws the officers of our army from every state and rank in life would be apt to be overthrown.

Any system, however, which would enable our youth and those National Guardsmen who are anxious to improve themselves in military matters to do so would be of great value. Military instructors in colleges, short-term service in army posts,—like the one-year volunteers of Germany,—would cost the country but little, and add greatly to its means of defense. It cannot be expected, however, that such men as compose our National Guard will enlist as privates in the army.

NEW YORK, July, 1888.

They would not like to associate with the men, nor would the influence upon them be good if they did.

Examinations and diplomas in the method suggested by Colonel Rice—anything, in fact, which will help the National Guardsman to fit himself for service without taking up more time than he can afford to devote—should be provided.

I cannot agree with Colonel Rice as to the value of large camps of instruction. They look imposing, but there is very apt to be too many "reviews" and ceremonies. A model camp should have as little show and as much hard work as possible. At the meetings of the United States National Guard Association the regimental officers all preferred regimental camps. The experience of New York shows, however, that there should be carefully selected instructors and inspectors to see that the prescribed work is done, and done properly.

George W. Wingate,

President National Guard Association of the United States.

IV.—OUR NATIONAL GUARD.

MALE citizens of the United States between eighteen and forty-five years of age are considered available for military duty, men holding State or Government positions, or certain religious beliefs, being exempt.

During the summer of 1887 twelve States and one Territory* had their guard inspected, while in camp, by United States army officers detailed for that purpose by the Secretary of War. The following extracts from the reports of some of these officers give an idea of the efficiency of the guard in general.

Colonel H. M. Black, United States Army Inspector Michigan N. G. :

The general appearance of the several regiments was excellent. All looked young, active, energetic, and healthy, and have in them the material to make as fine soldiers as could be found in any country.

Colonel E. S. Otis, United States Army Inspector Pennsylvania N. G. :

The men are young, of fine physique. . . . Its intelligence is of a high order; its organization is effective; its practical knowledge, considering its opportunities, very marked.

Colonel W. R. Shafter, United States Army Inspector Second Brigade California N. G. :

The conduct of the men while in camp was most excellent, their physical condition good, and it was apparent that the only thing necessary to make them first-class soldiers was the need for their services in actual warfare.

Edwin C. Mason, Acting Inspector-General, United States Army :

From my experience with the militia in years past, I was entirely unprepared to find the National Guard on such a high plane of discipline and general efficiency as I find that in the State of Iowa.

Colonel E. F. Townsend, United States Army Inspector Dakota N. G. :

It is an excellent body of men, full of zeal, and only requires to be directed rightly to make splendid soldiers.

* Alabama, California, Dakota, Delaware, Illinois, Iowa, Michigan, Minnesota, New Hampshire, New York, Ohio, Pennsylvania, Vermont.

Adjutant-General Drum, United States Army (report to Secretary of War, 1887), calls attention to these reports as follows :

The reports, appended hereto, of the several inspecting officers are highly interesting and instructive. The steadily increasing interest manifested by the militia of the States is evidenced by the high percentage of attendance at the annual encampments and the general excellent military spirit of the troops. . . . Young officers of the army could be spared during the winter, to report to the adjutants-general of States, on application of the governors, to aid in the instruction of both officers and non-commissioned officers.

Whilst the reports referred to show that the *personnel* of the guard is all it should be, there are deficiencies to which these reports point—deficiencies which consist mainly in discipline, knowledge of guard duty, and equipments.

Whatever in the way of uniforms and equipments have been obtained were, until recently, issued by the State or purchased by the men themselves, but now the United States Government lends a helping hand by an annual appropriation of \$400,000 "in the way of equipments," each State being allowed its *pro rata* proportion. Each State has its own uniform and button (a few States, having adopted the United States army uniform and retaining the State button, are exceptions). The guns in use vary, but the tendency now in this is to adopt the regulation United States army gun, and many States have already done so. The armament of the artillery, as a rule, is old ordnance and unfit for service. The Gatling gun now forms part of the armament of the artillery in California, Connecticut, Indiana, Ohio, Massachusetts, New Jersey, New York, and perhaps other States.

The National Guard of the different States, if brought together, would present a variegated appearance as to uniform, arms, and general equipment.

The guard in each State is enlisted for service within the State only, and is under control of the governor, who by virtue of his office is commander-in-chief, and who appoints an administrative officer called the adjutant-

general, who looks after the guard. Each State regulates the pay for her troops, which in many States amounts to very little, while some allow the guard, when on duty, United States army pay.

The accompanying table based upon the official return of the Adjutant-General, U. S. A., July 2d, 1888, gives the strength of the regularly enlisted militia. It will be seen that our National Guard numbers about one hundred thousand, and the first thing to be considered is the efficiency of this body of men.

No return received from Arkansas. Arizona, Idaho, and Utah have no organized militia.

The officers of higher ranks and many of the company commanders now in the service served in the civil war, and those officers who did not, chiefly young men, are being molded and influenced by these veterans; and this influence will last long after the old soldiers are gone. The ranks are filled by self-sustaining young men who are unequalled in love of country, soldierly qualities, education, and habits.

Instead of keeping up a large standing army for the maintenance of its honor and integrity, this country relies on the volunteer. That the volunteer is expected

to respond to all calls in time of need is sufficient reason for having him properly equipped in time of peace. The guard as it now stands is virtually a volunteer army; although only sworn into State service, these men would at the first call *volunteer* to go wherever their country needed them.

Many theories have been advanced for the improvement of the guard, and the following ideas in regard to this improvement have been suggested by reports of inspecting officers, articles in military journals, conversations with military men, and service in the guard.

Let the guard be divided between the States and Territories in accordance with the population, and have a uniform oath of enlistment swearing men into the service of the General as well as the State Government. Make them, in fact, United States volunteers, and, if best, change the name from National Guardsmen to United States Volunteers.

After thoroughly equipping and arming, let the United States Government instruct them in the duties of the soldier; and with this in view, the Secretary of War could detail competent officers to visit as often as needed the armories in each State, to give instructions by means of lectures, schools, drills, etc., these officers, for the time being, to act in conjunction with the State's adjutant-general.

The adjutant-general of a State is a political appointee, and this is often detrimental to the guard. When a competent adjutant-general is found he should be retained, without reference to politics or change of governors. If this cannot be accomplished, let the Secretary of War detail a suitable officer, who, although acting under orders from the governor, would be free from political intrigue.

An important addition to any plan would be a pecuniary inducement for men to attend drill. Allow something per year for attending drills,—it need not be a large sum,—and for absence unexcused deduct a stipulated amount. Thus the hardest thing to contend against—non-attendance at drill—would be remedied. When drilling, in camps of instruction, or on duty for the General Government, let the same authority pay them; and when a State calls for them, let it pay for the service rendered. The idea of paying these men for drilling might be antagonized on the ground of expense; but it must be remembered that the money would be spent on our best young men, and that these men are holding themselves ready to spend their lives, if need be, for their country. The physical and mental training, the improvement in carriage and general appearance, of the men is a strong argument in favor of this plan. Furthermore, the fact that they were being paid for their efforts in perfecting themselves as citizen soldiers would increase their zeal and keep the ranks filled with the best material.

The State's adjutant-general's department should be supported by the State, and armories provided by the same authority.

Were the foregoing ideas carried out, the result would be a United States volunteer army divided between the States, the troops in each State forming a military department under command of the governor; but when called into the service of the General Government, the soldier would pass from under the State's control and be subject to the United States authority.

The importance of selecting efficient officers is not to

be lost sight of. The common plan now in vogue is for the men to elect their officers. When in addition to this the newly elected officer is required to go before an examining board, properly constituted, incompetent material will be kept out.

The following, from the last year's report of General Sheridan, is worthy of the consideration due to the high authority from which it comes :

I am strongly in favor of the General Government extending all possible aid to the National Guard of the different States, as they constitute a body of troops that in any great emergency would form an important part of our military force. They should be armed with the best weapons, amply provided with complete camp and garrison equipage, and instructed in the various drills and exercises according to the tactics and systems followed in the regular army. According to my observation and experience, most of the State troops now march well and handle the gun well, but they are deficient in discipline and all the duties that teach a soldier to take care of him-

self while in camp and upon the march. This defect can best be overcome by establishing some system of encampment under the control of the General Government. In the development of such a measure, the entire army, as well as myself personally, will be glad to render such assistance as lies in our power, and I recommend that the favorable consideration of the subject may be commended to Congress.

Experience would soon demonstrate the feasibility of any plan which might be adopted, and by proper changes, as needed, an effective system could be formed. In many States the maintaining of a military force is now a necessity in order to keep down the riotous element so freely admitted to our shores.

The number of men available for military duty is estimated at 8,000,000. Granting that a National Guard 100,000 strong is large enough, there would be one citizen soldier out of 80 available men, or one-eightieth of our strength, equipped.

Edmund Cone Brust,

Major 1st Regiment Light Artillery Ohio National Guard.

ZANESVILLE, OHIO, July, 1888.

SAPPHO.

UPON a height, upon a height of song,
A maiden sits whose bosom ne'er hath
heaved
With the dark billows that to Love belong,
Who hath not been deceived, who hath not
grieved.

From the bright bow of her delicious lips
Arrows of music, like to sunbeams, spring;
And, like the shafts upon the shoulder tips
Of Phœbus, loud in human hearts they ring.

Greece shuts her eyes to listen, as the lay
From Lesbos' isle o'ersings the echoing sea,
And in the purple fields of nether day
The shade of Homer brightens wondrously.

Tears fill those eyes, long blind to human strife—
Tears of keen pleasure such as Hector shed,
When on the fragrant bosom of his wife
The hero's baby hid a startled head.

And in that grove of cypresses severe
That sadly sentinel the Stygian stream,
When Sappho's music brims her empty
ear,
The ghost of Helen smiles through her dark
dream.

For never yet, since naked from the wave
That climbed her, clamorous for a last
embrace,
Arose that goddess crueller than the grave,
With gleams like laughter in her gliding
grace,—

Oh! never yet since Venus like a flower
Rose from the subject sea, hath woman's
word
The world's deep heart with such mysterious
power,
The world's deep heart, like the deep ocean,
stirred.

But if the shadows in the populous vasts
Of Death's domain thrill at the song divine,
Oh! how much deeper is the spell it casts
On those who still quaff Life's resplendent
wine!

No wonder maids of Lesbos 'neath the moon
Dance till the day comes blushing up the
hill,
And then in coverts apt for amorous swoon,
Till noon bring sleep, of dream-love take
their fill.

No wonder men of Lesbos are inspired
To loftier aims of love, to grander deeds
Of patriot purpose by the singer fired.
But now, alas! her own full bosom bleeds:

Phaon has come, and on her perfect lips
The song's perfection ceaseth. She is mute,
While from her sudden-moistured palms there
slips
Quick to her feet the sudden-rifted lute.

Phaon has come: alas! for happy days,—
Alas! for innocence of girlish youth,—
Her eyes are dazzled by his careless blaze,
Her mind enslaved by his apparent truth.

Strange! Other men as beautiful as he
In Lesbos, lovely land, have wooed her
warm,
And often sworn to her on bended knee
Her sweet song could not match her face
and form.

But Phaon proudly towers above the rest,
And at his lightest word each ruddy drop
In her bright body, hurrying to her breast,
Burns with a madness that no will may
stop.

"I love him, love him, but does he love me?"
Ah! question asked for ages,—seldom yet
Securely answered—by what hard decree
In woman's rose-heart must that thorn be
set?

"I love him, love him," in her eager ear
The small bird sings it, brightly fluttering
by;
Or when she wanders by the ocean drear
The billows moan it, and the winds reply.

When she believes he loves her in return,
The summer days a splendor more serene
Are gemmed with, and the nights more lovely
burn,
While stars, like golden hearts, throb large
and keen.

When she believes he doth not love her—
oh!
The night is not so gloomy as the day,
Because with day her mind's worst shadows
go,
And sleep with dreams her anguish can
allay.

But he hath spoken—oh! the golden tongue,
Oh! jewel words, forever to be worn!
He loves her: he hath said it—or hath
sung,
For speech is music on this happy morn.

Away with doubts, away with fears, make
room!
Alas! the world is narrow for such bliss:
One life is narrower still to hold the bloom,
The flower divine of that first double kiss.

Sappho is crowned so tall with happiness,
She cannot stoop to sing as erst she sang:
To voice her secret joy would make it less;
To set it to a tune would be a pang,

Because 't would seem to limit it, and so
In Phaon's arms she lets the moments fly,
Each night her passion gaining in its glow,
Each day her worship soaring still more
high.

But the hour comes that comes with certain
pace
To all things human, be they glad or sad:
There is a shadow on her Phaon's face;
His voice forgets the tender tones it had.

Yet still he seeks her side, and, cruelly kind,
Lingers,—and so hope lingers,—and she
tries
With strange new fancies to enmesh his mind,
E'en as she dons new robes to snare his
eyes.

But the hour comes that comes with certain
pace,
And Phaon comes not to the trysting-tree!
His heart is tangled in a newer grace—
Another face, perhaps, more fair than she.

What then, to lure him back, shall she at-
tempt—

Poor Queen of Song, still eager to be slave
Of one light man who never could have dreamt
What an immensity of love she gave?

"Yea, I will sing some world-compelling song,
My long-neglected lute—I will retake."
Alas! her spirit's discord is too strong:
The music's heart, like hers, can only break.

"Thou, too, art false! Down, down, false lute!" she cries;

"If from thy secret chambers of delight
I cannot win one song, how vain my sighs
Would be to summon Phaon to my sight!

"Gone is my gift — my magic is o'erspelled:
O thou, dear Goddess of the silver bow!
Let now my grievous misery be quelled:
To ease this heart I pray thee overthrow

"This brain with one swift arrow. Goddess pure,
Most glorious Moon, mother of dreams, be kind;
Since for this woe there be no earthly cure,
Rain down a heavenly madness on my mind."

The goddess hears her and in pity bends,
Remembering Latmos and Endymion:
Swifter than lightning is the beam she sends,
And lo! a shade on Sappho's mind is thrown.

But her dark eyes flash brighter than before,
And loud she sings — so loud that, stunned with fright,
In the dense bosk the nightingales no more
With thick, precipitate song o'erpraise the night.

A shade on Sappho's mind, and now, and now,
As if in symbol of high sympathy,
A cloud is gathering on heaven's azure brow
From veils of vapor that have left the sea.

Louder she sings, and, singing, blindly takes
A little goat-path up the precipice
At whose rough base the angry ocean breaks
With a long, rolling roar and then a seething hiss.

See now! she climbeth to the topmost crag:
'Twixt crag and cloud she poise like a bird,
Her long dark locks out-floating like a flag:
Her bosom panting like a racer spurred.

The sacred fury bubbles to her mouth;
From that divinest of all human throats,
Sweet as a honeyed zephyr of the south,
Loud as a silver clarion come the notes:

"Lo! I am She who sprung from the deep sea:

My car, a pearl, was drawn by rival doves,
And, like the play of little flames, round me
Gambled a roseate cloud of baby Loves,

"Precocious Cupids, armed with quip and jest,
To tease the senses of humanity;
But ah! my sleep in the sea's womb was best —
Was best for mortals and most sure for me.

"For, when deep calleth unto deep, above
Imagination must the tempest soar,
And when the very Queen of Love doth love,
The peace of gods deserts her evermore.

"So I, who was a goddess yesterday,
Am now a feather for the breath of Fate;
Dead is my lover, dead and gone away
Down through the wide, the ever-open gate.

"Then let me go, because I cannot die,
Back to the dreamful womb from whence I sprang;
O Mother, Mother Ocean! look, I fly
Theewards to solve me of this earthborn pang."

A flash of eyes — or is it lightning now?
A tossing of white arms — or is it spray?
And Sappho crowns no more the crag's dark brow;
Her beauty, like a dream, hath passed away.

Then from the cradling waves ascends a sigh
Half pain, half joy: the dolphins in their leap

Pause, and the sea-mews pipe a puny cry
Against the thunders gathering o'er the deep;

But Sappho, free from dreams, now sleepeth
the true sleep.

Henry W. Austin.

TOPICS OF THE TIME.

The American Volunteer.

READERS of the papers on war subjects that have appeared in the pages of *THE CENTURY* cannot have failed to note in them from time to time points bearing upon the topic presented in the articles on the national military system in this number of the magazine, in which General Kautz of the Regular Army and the officers of the State Militia, writing for their respective divisions of the service, call attention to the soldierly qualities of the young men of the nation and their general capacity for a thorough and liberal education in the theory and practice of military arts.

In *THE CENTURY*'s narratives of battles and campaigns of the civil war, distinguished leaders of both sides have laid particular stress upon the character of American volunteers. Grant, McClellan, Longstreet, Beauregard, Sherman, all but one leaders of armies, and that one—Longstreet—the permanent commander of an army corps, have in the course of their articles praised the troops that bore upon their bayonets the fortunes of the respective sections. General Grant in his Shiloh paper, contrasting the volunteer with the regular, says that the former system "embraced men who risked life for a principle, and often men of social standing, competence, or wealth." General McClellan in his account of the Peninsular campaign, writing of the Seven-Days' fighting, says, "No praise can be too great for the officers and men who passed through these seven days of battles, enduring fatigue without a murmur, successfully meeting and repelling every attack made upon them, always in the right place in the right time, and emerging from the fiery ordeal a compact army of veterans, equal to any task that brave and disciplined men can be called upon to undertake." General Longstreet in summing up results on the invasion of Maryland in 1862 says, "Our soldiers were as patient, courageous, and chivalrous as any ever marshaled into phalanx." General Beauregard writes of the first Bull Run that "the personal material on both sides was of exceptionally good character," and says that at Shiloh his command was "of excellent personality." General Sherman, in "The Grand Strategy of the War," after commenting upon the trained soldiery of Europe, concludes as follows: "Nevertheless, for service in our wooded country, where battles must be fought chiefly by skirmishers and 'thin lines,' I prefer our own people. They possess more individuality, more self-reliance, learn more quickly the necessity for organization and discipline, and will follow where they have skilled leaders in whom they have confidence."

These commanders were all scientifically trained to the profession of arms, and, with the exception of the last, the remarks quoted apply to the volunteers early in the war. It is a fact that some of the best fought battles of the war were those delivered in Virginia and Maryland, and in Mississippi and Tennessee, in

1862, when the troops engaged had been less than a year in service, many of them less than half that time. Though a variety of circumstances are taken into account by a commander who is about to risk all upon one feat of arms, the reader of these inside histories of battle-field events seldom or never finds a general, when writing of such a crisis, betraying a want of faith in his troops. That the troops would do all that men could do under the circumstances seems always to have been a safe conclusion. This was not alone the case where the test was one of brute heroism simply; it was so when high moral courage was needed. If the armies were irregularly rationed because there was no means of transportation, there was no mutiny; the men slung their muskets across their backs, took up tools proper for the work, made roads, constructed bridges, repaired and manned engines, cars, and boats, and when the lines of supply were in order returned to their proper work before the enemy. General Grant states in his story of the Chattanooga campaign, "Every branch of railroad building, making tools to work with, and supplying the workmen with food, was all going on at once, and without the aid of a mechanic or laborer except what the command itself furnished." Instances innumerable are recorded in these vivid narratives, showing that the American people, in war as in peace, are equal to every emergency. Men bred to the professions, and to the finer callings of art and trade, were both able and willing to handle the shovel and pickax whenever it became necessary to the safety of a position to have it entrenched.

But beyond this superb personality of the volunteers, —a quality which is of course of the highest importance,—there is little in these military narratives to encourage the people in a belief that the country is at all times prepared for war.

The energy and versatility that are so invaluable in soldiers and so characteristic of American young men must be guided by scientific methods, and scientific knowledge in military matters is not a mere routine acquirement. There is such a thing as the genius of battle; and genius in war, as in other fields of high endeavor, rests oftenest upon men whose well-trained powers lend them confidence and freedom in the heat of action. Most soldiers, perhaps all, who have the true military spirit are not by nature lovers of strife. Hence the placing of proper knowledge of the arts of war and of the control of implements of war into the hands of men devoted to military life, especially men who, like the American militia, are citizens, having all the interests of citizens in the preservation of peace and of the institutions of the land, would seem to be a wise solution of the military problem.

Germany maintains peace by being always prepared for war. Men like the volunteers who have been described in the recent war narratives, and who are again considered as the proper personnel for the military

system of to-day, in the articles by General Kantz and Colonel Rice, will not under any encouragement seek diversion on the battle-field; but rather, when driven to it, will wage war as a measure that makes for peace. American volunteers will never again be pitted in war against American volunteers. The question seems to be whether American volunteers of the future shall enter upon the campaign against a foreign foe, when it is forced upon them, as an army of well-trained citizen soldiery, or, speaking from a military point of view, as a heterogeneous mob. Conditions have changed since military men now living acquired their experience, and they will continue to change. Unless our methods of preparation are in keeping with the times, we must one day pay dearly for the oversight.

Philip H. Sheridan.

IN the death of General Sheridan the country has lost another of the five soldiers—Grant, Sherman, Thomas, Meade, and Sheridan—to whose directing hands the nation, North and South, is mainly indebted for the successful conclusion of the contest for the preservation of the Union; a man, moreover, whose place as a picturesque figure of the war and whose military reputation were established during his life. There is likely to be little difference of opinion in the historical estimates of so uncomplex a nature—as a man, strong and simple, as a commander, vigilant, resourceful, bold, confident, decisive, and reliable. Probably no officer on the Union side, except Hancock, and none on the Confederate side, except perhaps Forrest, so nearly embodied the instinct of war, the pagan idea of Mars. It speaks much, therefore, for Sheridan's personal character, and much for the American popular ideas which produce such sentiments in our soldiers, that at heart, like Grant, he had an utter abhorrence of war, having been known even to say that the time is coming when the killing of a thousand men in battle will be looked upon as a thousand murders.

In a certain sense it may be said, without derogation, that Sheridan's fame outran even his notable achievements. Brilliant as he was in raid or pursuit, or in the gorge of battle, it was not until the first great raid to Richmond, and in the masterly campaign of the Shenandoah Valley, and in these alone, that he may be said to have exercised anything like the initiative which goes with the responsibilities of a command of the first rank. He did nothing that was not done well; thoroughness was his most conspicuous trait. But the fortune of war did not throw to his lot the solution of the largest military problems. Grant, on the other hand, was prepared for the grand strategy of the last year of the war by having had on every field he fought, from Belmont to Chattanooga, the widest option and responsibility. The most accurate judgment of a man is likely to be found in the consensus of contemporary opinion, and in this light it is a magnificent tribute to Sheridan that most of the prominent officers of the contending armies have thought him fit for greater commands than those which he actually exercised.

This was the judgment of Grant, and we believe is that of Sherman, and of many others only less distinguished.

It is inspired by the fact that Sheridan was, first of all, master of his profession; that he was always ready to give more of service than was expected of him, and that he had not the limitations of petty personal qualities which detracted from the success of so many commanders on both sides. His life was devoted to the service of his country; his action was uninfluenced by animosity; and his death, like that of Grant, is an occasion for considering anew the benefits of the great struggle, and for renewing those pledges of generous friendship between former foes which is the crowning glory of the American soldier.

The Amenities of Politics.

OUR country has been peculiarly fortunate in the orderly development of its political history, which has secured at each successive point a clearly marked line of division between the two great forces that have finally made the country what it is. There have been very few periods in our history when the individual voter has not had a clear opportunity of choice between two fundamental and opposing theories of government and politics, while the phases of this opposition have changed as the country and its needs have changed. The one force has had its time of peaceful growth and its time of abnormal development, when it went so far as to strike at the very life of the republic; but it has developed generally in strict accord with the natural growth of the country, and gives us now a system of local and internal government more nearly approaching perfection than any other system has yet provided for its citizens. The national idea, too, has had its period of abnormal development, when it seemed to threaten not only the liberty of the individual, but even the life of the States; but its general course of development has been no more rapid than the highest needs of the country have made imperative. One can hardly follow the constant conflicts and alternate triumphs of these two historical forces without a feeling of special wonder at the definiteness of the issues which they have offered from time to time to the mass of voters, and the general success with which popular government has in every case indorsed with its approval that one of the two whose success at the moment was more important to the general welfare of the country.

Yet he who loves and respects his fellow-man cannot escape a sense of humiliation as he notices the apparent indifference of individual men to the great issues really at stake. The two streams of force are grand, imposing, and impossible to mistake: the individual units whose thought, feeling, and action make up the sum of these forces are apparently actuated by anything but a consciousness of the historical stream of which they are a part. Eighty or ninety years ago, for example, the country's foreign and domestic character seemed to be at stake. It was a question whether the rising republic was to take its place among the nations of the earth as a mere congeries of jarring states, without respect abroad or confidence at home, or as a strong, homogeneous nation, which would not permit other nations even to know officially that there were diversities of interest within the United States. Here, at least, would seem to be an issue which Federalist and Democrat could appreciate promptly and

argue clearly, and which would drive out at once every extraneous consideration. Nothing of the sort: the great streams of political force flow silently on to their destination, but not one in a thousand of their individual units seems to have been conscious of the real current of his action. The scene of politics becomes a curious study. Here is one man who can think and speak of nothing but Mr. Jefferson's atheism, while there is another who is as profoundly absorbed in the atrocious schemes of New England politicians to sell their country to the Governor-General of Canada. Here is one who can talk only of Mr. Madison's dissimulation in masking his truckling subservency to France; there is another whose field of political discussion is limited to the manner in which New England Federalists have used blue lights for the purpose of conveying signals to the British blockading fleet. When almost every individual thus confines his thought to one little corner of the political field, it is astonishing that the sum-total of such pettinesses should so exactly balance and eliminate the really petty elements and put the great issues into their proper place.

Nor is this characteristic confined to ancient history: the grandest crises of the nation's history have never been able thoroughly to ennoble the expression of the individual's sense of them. One need not go far back from the present to find cases in which the great issues of politics have been belittled or disguised by the pettier phases of them to which individuals have been willing to confine their attention and their motives.

The whole process, however, has its encouraging side in the evidently increasing determination of voters, with the spread of general intelligence and the multiplication of channels for obtaining intelligence, to insist upon having definite and fundamental political issues presented to them, and to turn a deaf ear to the random recriminations which once formed the politician's main stock in trade. The tendency is enough to explain at once the progressive improvement in the tone of political discussion, up to and including the present presidential election, to which every historian will bear witness, and the increasing repulsion of the people to any attempt to revert to the methods and manners of the past. There are with us still more than enough of the remnants of the past; but men dislike them more, and are continually more ready and prompt to protest against them. Every new appeal to men's intelligence becomes a new force, making them more apt to resent, as an insult to their intelligence, any subsequent attempt to influence their decision on great and fundamental questions by the introduction of the petty and transitory party cries which used to be so effective. The tendency in the natural growth of democracy is not towards demagogism, but away from it: it may yield to demagogism at first, but it discounts demagogism in the end.

We may be certain, then, that political parties will see more and more clearly that nothing is more profitable in political discussion than a decent regard for the amenities of politics. Anything less than that implies a disrespect for the intelligence of the voters to whom the appeal is made; and no one will be more apt to feel and show an increasing sense of such disrespect than the voters themselves.

Who is the Genuine Party Man?

It would seem to be self-evident that political parties are, properly, associations of voters for the purpose of putting into practice certain political principles. Such a purpose can only be accomplished in a free country by associated action—that is, by party action. We believe in parties, and we believe no less in political independence. But independence *in* party action by no means implies independence *of* party action. The truest sort of an independent in politics may be a firm believer in parties. The genuine independent uses parties; he does not let parties use him. He is, in fact, the only true party man; the only man who uses party for the legitimate and essential party purpose of putting into practice certain definite political principles. No sight is more pitiful than that of a free citizen who continues to vote with a party that is pledged to carry out certain definite political principles, of which principles the voter heartily disapproves. The citizen who does this not only stultifies his own manhood, but helps to degrade all political action, offers a premium to the interested professional partisan, and becomes a clog upon free institutions.

There are occasions when an honest man must be respected in his hesitation to make a "choice of evils," but as a rule we have little sympathy for the squeamish or falsely sentimental citizen who virtually disfranchises himself when great political questions are to be decided, or goes off on side issues, leaving the actual fight to men of strong convictions, pure and definite purposes, and genuine grasp of the situation; and we have quite as little sympathy for the man who through simple inertia or false shame and moral cowardice fails to make use of whichever party at the time being best represents his own political principles.

The professional and interested partisan spends a large portion of his time in appealing to the free, independent, and rational decision of his fellow-citizen; and another large portion of his time in abusing the fellow-citizen who acts as he is importuned to act—that is, on his own unprejudiced and independent volition. But such abuse falls harmless at the feet of those who use parties intelligently, instead of submitting to act as their slaves and tools; who, far from despising party machinery, cheerfully make use of this machinery to advance what they believe to be the best interests of that common country which all political parties profess to serve.

Manual Training.

SINCE the writing of Mr. Patterson's brief essay, in the present number of *THE CENTURY*, there has been a decided advance in the movement towards manual training in our public schools, and this new system must have the effect of lessening the tendency towards clerical labor. Mr. Patterson's remarks offer, incidentally, a strong argument in favor of manual training, though we are well aware that the advocates of the training of the hand base their arguments largely upon the consequent training of the head,—in other words, on the general educational value of this special branch of education.

OPEN LETTERS.

Lincoln as a Military Man.*

THE recent publication in *THE CENTURY*, in the Nicolay and Hay history of Abraham Lincoln, of documents, letters, etc. hitherto inaccessible to the public has shown the phenomenal superiority in civil matters of this man of men to his associates and his surroundings. Whether as a publicist, diplomat, statesman, constitutional lawyer, or "politician," he had no equal in those fateful and momentous days from 1861 to 1865.

There are some who estimate his military ability as equal to his civil. My own reading of and acquaintance with the war of the Rebellion led me to entertain this opinion some years since, albeit my judgment in such matters is not entitled to weight enough to warrant its publication.

But of all war-students none was so well qualified to speak with authority on this point as the late Colonel Robert N. Scott. His intimate personal acquaintance with the prominent actors in that war, his varied personal experience of military service, and, above all, his relation to and familiarity with the "Rebellion Records," gave him the right to speak with authority.

Having to call upon him some years since at his "War Records" office, the business in hand led naturally to some discussion of the leaders of the army. Colonel Scott showed me letters, tables, and documents, then unpublished, that led him to certain conclusions in respect to certain men. Then looking up, he said, with enthusiasm and vehemence, "I tell you, M., the biggest military man we had was Abraham Lincoln." He disclaimed for him, of course, knowledge of military technique; but, in respect to what should and what should not be done, and when and where, he said Lincoln "was more uniformly right and less frequently wrong than any man we had."

WASHINGTON, D. C.

Lowell's Recent Writings.

WHATEVER diplomacy loses in the renewed lease of leisure given to Mr. James Russell Lowell, there is a distinct gain to American letters in more fields than one. His recent addresses on subjects not yet wholly resigned to the "shouters" furnish a model for the "gentleman in politics." In these addresses he reaches that high standard of public duty which led him as a young man to speed the flight of the runaway slave to Canada, and which, in the later antislavery days, held him with Sumner at the van before the piping times of peace had brought the rear to the front. This is a clear gain for political literature; while the few essays—only too rare—on purely literary themes show no weakening of the critical faculty on the part of our best and keenest critic. The scholarship is as rich; the wit ripener and more genial, less combative, but not less trenchant. Now we have in the new

volume, "Heartsease and Rue,"† all the virtues lying behind the prose—the sure touch of the critic; the shrewd cast of judgment which holds state affairs to the tests of conscience; satire, less in quantity, but equal in quality to his best; and wit flashing through satire, giving to it a kindlier glow. Of unmodified satire perhaps the best specimen is the "Tempora Mutantur," dating back in form and manner to the oldest satirical verse, but striking the public vices of the times with an accuracy of aim worthy of Andrew Marvel, the Parliament poet of the Commonwealth who is less read to-day than he deserves, but of whom we are reminded in verses like the following:

A hundred years ago
If men were knaves, why, people called them so.

Men had not learned to admire the graceful swerve
Wherewith the *Æsthetic Nature's* genial mood
Makes public duty slope to private good.

But now that "Statesmanship" is just a way
To dodge the primal curse and make it pay,
Since office means a kind of patent drill
To force an entrance to the Nation's till,
And peculation something rather less
Risky than if you spell it with an "s,"

With generous curve we draw the moral line:
Our swindlers are permitted to resign.

Confront mankind with brazen front sublime,
Steal but enough, the world is unsevere,—
Tweed is a statesman, Fisk a financier;
Invent a mine, and be—the Lord knows what;
Secure, at any rate, with what you've got.

Even if indicted, what is that but fudge
To him who counted in the elective judge?
Whitewashed, he quits the politician's strife
At ease in mind, with pockets filled for life—

A public meeting, treated at his cost,
Resolves him back more virtue than he lost.

With choker white, wherein no cynic eye
Dares see idealized a hempen tie,
At parish meetings he conducts in prayer,
And pays for missions to be sent elsewhere;
On 'Change respected, to his friends endeared;
Ad but a Sunday-school class, he's revered,
And his too early tomb will not be dumb
To point a moral for our youth to come.

Lines of severe satire like these are fewer in Lowell than those wherein humor, if it does not entirely neutralize, at least dulcifies the acids. The man who looked upon public life sixteen years ago—let us put it as far back as that—had little stomach for anything but satire. Lowell was no lamp-blinded scholar stumbling into politics with a green shade over his eyes, but a man who saw the active side of human life in company with men of the widest knowledge of affairs. It has always been the fashion for the genuine statesman in New England to lounge in the scholar's arm-chair, and for the scholar to hobnob, over cigars, with the statesman. Thus Lowell dropped into politics, in the higher sense, and did service some years before the "shouters" of to-day knew how to spell the word politics. When he went to Spain, and afterwards to England, he went as one

† "Heartsease and Rue." By James Russell Lowell. Houghton, Mifflin & Co.

trained "at the gates of the king," and the king's gates in those antislavery days were thronged by such men as Sumner and Phillips and Garrison, Rantoul and Mann, from whom, as Xenophon puts it, one could learn much good and no evil thing. There was always there a good supply of "them literary fellers" with the double D's. The scholar became a statesman, the statesman a scholar by force of association. There was then, as always, a form of statecraft which meant "manipulation," which never presides at the formation of parties based on principle; which is, in fact, too busy in "handling" to do much with heading parties; and Lowell, who had helped in his way in founding the old antislavery and the new Republican parties, could never look into the face of a "manipulator" without a laugh; and the more he looked the more he laughed. The satirical laugh, as a weapon of offense, he was master of; and with it, better than many stump-speakers, he did service. It is a wholesome weapon, this amalgam of satire with laughter—if that can be called wholesome which first doubles you up and then cuts at the doubling-point. "Heartsease and Rue," however, is, as I have said, not greatly given to satire of any sort. It is the mellowest and kindest of all Lowell's literary work. Many of the poems date back a quarter of a century and more. Of these one of the best in pure humor is, "At the Burns Centennial," which antedates the war period. For the promised continuation of another, "Fitz Adam's Story," some of us have been waiting and hoping half of an average life. "The Origin of Didactic Poetry" reads like a stray leaflet from the "Fable for Critics," and will be remembered with that. The "Agassiz," which is younger, rises at times to the full height of the old "Commemoration Ode." All scholars will count it a perpetual treasure. Of the various sonnets—a form of verse in which Mr. Lowell seems least successful, perhaps because his fancy is too rich and too discursive to let him follow one clear stream of thought as closely as the sonnet requires—the most pleasing to one reader at least are "Scottish Border," and the first and third of those entitled "Bankside." But there are two stanzas, sonnets in quality, and almost in form, of unusually beautiful clearness. These are "The Prison of Cervantes" and "My Portrait Gallery."

But how idle to try to pick out the best, when each will be best to some, and when all have passages not excelled by any poet of to-day for flavor, for humor, for virility, for the human quality, which still, as ever, serves to bring Lowell home to our hearts, and to keep his verse on the scholar's table. One of these poems of finest reach and beauty is his latest, "Endymion," wherein the mood, however, is of the almost incommunicable kind, kindled in all of us sooner or later by the fact that the image-making faculty of youth will enter at last into an unsatisfactory competition with the dull realism of middle life and old age. It is the mood which led Wordsworth, on the one hand, to write his grand ode on "Immortality," and Byron, on the other, to sing, in more human strain:

O could I feel as I have felt, or be what I have been,
Or weep as I could once have wept o'er many a vanished scene,—
As springs in deserts found seem sweet, all brackish though they
be,
So midst the withered waste of life, those tears would flow to me.

James Herbert Morse.

Lectures on American History.

THE attention given by THE CENTURY to matters of educational importance prompts me to bring to the notice of its vast circle of readers a project which must have much interest for them as citizens of this great republic. The value of educating and elevating their fellow-citizens, or of assuring that the education of future citizens be such as to secure their highest honesty and efficiency as citizens, will commend itself to all who are already good citizens. The project referred to has this end in view.

For several years courses of lectures have been given to the youth of Boston with a view to afford sound instruction in history and the principles of American institutions and government. These lectures were instituted by Mrs. Mary Hemenway, who was instrumental in saving from destruction and devoting to this noble object the Old South Church; and these lectures have been known as the "Old South Historical Courses." In Boston they have aroused an interest in and an enthusiasm for political and historical study that has borne valuable fruit; and lately similar courses have been instituted in some Western cities, notably Chicago, Milwaukee, and Minneapolis, the value of the work having been perceived by energetic educators of those places. Now it is proposed seriously to push this work forward throughout the country wherever there is interest or opportunity enough for its direction and maintenance. Interest in and knowledge of it are almost everything that it is necessary to arouse. Its direction and maintenance will be easy, and the opportunities for it are unlimited. It would prove valuable where there is even only one school, and home talent for its conduct could generally be found even in such places. The study of the local history and institutions of the places would in such cases be a fitting and comparatively easy work, and, besides showing what real study and investigation mean, would lead to the larger study of the history and institutions of state and nation, and so prove of incalculable value. But the need of such work in the large cities particularly, and in New York more particularly, is what I wish to enforce now. The socialistic and communistic doctrines so prevalent in these cities, the corruption so widespread among their officials,—and often, too, among their voters,—the ignorance so apparent of either institutions or economics, the want of reason even, as shown in the misunderstanding or misapplication of the simplest and most evident principles of this science and in the conduct of private organizations, prove this need of something better in the education of citizens.

The education of citizens is the proper work of the common schools. They have no other valid reason for existence. They have no other right to public money. If they fail in the education of citizens, they have no right whatever to public maintenance. But they do fail. Hence—However, we will not enforce the conclusion. What we do wish is to see the schools put on such a basis as will falsify the premises and consequently nullify the conclusion. To do this, some such work as we have touched on above is necessary. The schools at present are incompetent to do their first duty. They must be made competent. Their teachers must be taught—first their duty, then how to do it. Some such work as that of the Old South His-

torical Courses is needed in New York City, and in other cities throughout the land. In New York particularly the end should be primarily to instruct the teachers and to put the first proper work of the schools on a basis that will meet the hardest criticism that can be brought against anything—that it does not and cannot accomplish the first object of its existence.

Mary R. Hargrove,
Editor of "The Teacher."

Fifty Tucks instead of One.

ONE does not need to be a Mrs. Methuselah to remember the breeze that stirred the waters of domestic life when the sewing-machine first became an actual, practical fact, and the world began to realize that a new and positive working power was at hand. It was, to begin with, a real godsend to the gentlemen of the press. Such eloquent paragraphs as they scattered broadcast from Dan to Beersheba! The emancipation of woman from the drudgery of the needle—what a theme it was for the glowing pens of the young journalists of, say, twenty-five summers ago! There were to be no more "Songs of the Shirt"; no more pallid women in dreary attics, stitching away for dear life between the daylight and the dark. Learned divines did not scorn to leave their Bibles and commentaries in unwonted tranquillity while they wrote column after column in praise of this new wonder. Poets sang paeans to it, and in plainest prose manufacturers and agents told us what it could accomplish. Long statements were tabulated, with hand-work and machine-work in opposing columns. A man's shirt, stitched bosom and all, could be made in so many minutes,—or was it an hour?—a woman's dress in an astonishingly brief period, and a child's apron in just no time at all. Well does the writer remember one ecstatic editorial in a famous religious weekly, in which the workroom was made the arena of a merry contest between the cutter and the machine, and save at some especially critical juncture, "like the rounding of a sleeve," the machine always came out ahead. It was very eloquent and impressive, even though by the uninitiated it had always been supposed that "the rounding of the sleeve" was the work of the scissors rather than of the needle.

Some of the brethren took another tack, and wondered what this evil world was coming to. The weaker sex was constitutionally lazy, as every one knew. American women, especially, were always ready to shirk their duties and responsibilities. Had they not forgotten how to spin and to weave? And now if they were to give up the sharp, disciplining needle, well might the lover of his country stand aghast.

But it must be acknowledged that this tone was taken by but few. By most of the writers and speakers of the day the sewing-machine was hailed as the benefactor of womankind—the herald of release from an intolerable bondage. An hour or two was to accomplish the labor of days. Then would follow abundant leisure—long, quiet hours with book or pen; time to think, time to grow, time for one's long neglected music, or for art; time for the cultivation of all the minor graces, and of that genial hospitality which can be found in its perfection only where there is leisure for social enjoyment. In the mo-

notonous measure of that tireless arm of steel lay the hope of the nation. For, as are the mothers, so are the sons.

That was the dream of twenty-five years ago. Has it gone by contraries, like other dreams, or has it come true? How is it, O my country-women? Have we any more leisure than we used to have? Or do we put fifty tucks where we used to put one, and find a dozen ruffles indispensable where two used to suffice—to say nothing of the fact that we make garments now by dozens, where we used to make them by pairs?

The relative prettiness of the garments is not now under discussion. The question is not one of taste, or of elegance, but of leisure. We all complain of being tired. High or low, rich or poor, learned or unlearned, we are all in a hurry—all trying to crowd ten hours of work, or study, or pleasure into six. Alike in city and in country, we meet women with harassed faces and tired eyes, nervous, restless, robbed of their birth-right—the quiet, restful grace which is one of woman's highest charms. And, more's the pity, when it all seems so needless, they are by no means the women who have the most really necessary work to do. Is there no way to help it?

Let the fifty tucks, which are good in their place and by no means to be quarreled with, unless they cost too much, stand for the many things that bring into our lives useless toil, useless burdens, useless perplexities; and then ask the Yankee question, Does it pay? Does it pay to have the tucks at the cost of what is better worth having?

Not long ago a friend showed me some dainty bits of needlework, the clothing of a little child, that had come down to her from her grandmother's mother. Fine as gossamer were the fabrics used, and the infinitesimal tucks and hems, the exquisite hemstitching and drawn-work, the delicate fagoting, the fairy-like stitches, were a wonder to behold. One could hardly believe that the lovely little garments had been made for actual use; had belonged to the wardrobe of a living child, intended for real service and not for mere show-pieces to be wondered at and admired.

"Doesn't this rather take the wind out of your sails?" asked one who stood near. "Talk about work and the hurry and flurry of this nineteenth century, and then look at this! Who can imagine a woman of to-day setting so many patient stitches into one little garment? Confess now that your theories are put to naught."

"On the contrary, they are only confirmed," I answered. "The hand that pulled these airy threads and set these minute, even stitches was neither hurried, nor flurried, nor worried. It was the willing servitor of a cool and quiet brain. This morsel of a frock was not caught up with a beating heart and throbbing nerves in the brief pauses of a heated, overwrought life, and hurried on to completion that the child might display it at next week's fancy ball or garden party. It was a long, happy labor of love, begun months before it was actually needed, and slowly touched and retouched as an artist finishes a picture. Its every fold speaks of calm and quiet, of summer afternoons in shaded porches, or winter nights by glowing firesides. It tells of motherly love and sisterly confidences, of merry chats and friendly greetings."

"But it was work, nevertheless," said my friend;

"and life is life, everywhere and always. I don't see how women ever had time or strength to put so much work on one baby dress."

"You've hit the nail on the very head this time," I replied. "That 'one' tells the whole story. Our children have dozens every season, and there is no end to the tucks and puffs and ruffles. Little Miss Mischief is arrayed in a fresh white robe in the morning. By noon it is soiled and must go into the wash-tub with all its dainty superfluities. Do you suppose this little robe was ever played in? — that it ever knew the meaning of a game at romps, or a mud-pie? By no means. The quaint little eighteenth century maiden who once owned it had a plenty of plain dainty 'slips,' easily made and easily washed, for everyday wear. *This* was laid away in a chest sweet with rose-leaves and lavender, and only brought out on great occasions. Do not fancy for one moment that it was ever consigned to the tender mercies of Chloe, or Bridget (if there were any Bridgets in those days), or even of Yankee Hannah. My lady herself 'did up' the pretty trifle, clear-starching and patting and pulling into shape without so much as breaking a single thread. How long, think you, would it have endured the rough handling of our day? But this little frock descended from child to child and did good service for a whole generation. One needs keen eyes to detect it, but it has been mended more than once — darned with such slow patience that the interwoven threads seem a part of the fabric itself."

Fifty tucks instead of one — tucks that speedily "perish with the using." The principle of the thing runs through the whole warp and woof of our modern life. As has been said before, there is no need to quarrel with the tucks. They are all well enough in their places. But to put our whole time and strength into them, even while we give utterance to the frequent complaint that there is no peace, no rest, no time for the grand old books or the bright new ones, or even to read the newspapers and thus follow the onward march of the stirring events of our own day — surely this is an absurdity. It is paying too dear for the whistle. It is selling one's birthright for a very poor and unsavory mess of pottage.

If they were always and everywhere beautiful — these tucks for which we are ready to sacrifice so much — there might be some excuse for yielding to their fascinations. For the woman who does not love beauty is an anomaly, a monstrosity. But fuss and feathers are *not* beauty; and there can be no true elegance that does not rest on the solid foundation of fitness. Therefore to most of us beauty must mean simplicity — the simplicity of life, dress, and manners, that would bring with it ease and leisure, and the peace that passeth understanding.

Tucks are not all alike, by any means; and they are not all made on the sewing-machine. Tucks mean one thing to me and another to you and still another to our neighbor. We have our own little private dictionaries, every soul of us, in the pages of which words bear the strangest and most contradictory significations. It would be laughable sometimes, and sometimes pitiable, if we could but read the definitions, never thought of by Worcester, Webster, or other authorities, that are given in these individual lexicons of ours to this one word — tucks! What it means in mine I

do not intend to say in this presence, nor what it means in yours. That is our secret, and we will keep it. But there are women to whom it means just this: a relentless war with flies and dust, speckless windows, mirrors on the polished surfaces of which there is never a spot or blemish, and rooms too prim to be comfortable. It means keeping the blessed children, with their toys and trumpery and pretty confusion, out of the parlor, little finger-prints off the piano, and every daisy and buttercup off the carpet. To some it means the handsomest and costliest house in town, with the most elaborate furnishings, and perfection in every detail. It means the finest and whitest linen, the most lustrous silver, the daintiest china. To some, on the other hand, it means the saving of every penny, the adding of dollar unto dollar, no matter at what cost of strength and health and womanly loveliness. To others it stands for the latest fashion, the last new wrinkle in drapery, the newest fancy in laces, or for whatever may chance to be the brief rage of the moment. To others still it means puff-paste and kickshaws, and all the countless dainty devices of the table that are a delight to the eye but a weariness to the flesh.

No one has a right to quarrel with these definitions. They stand, in most instances, for things good and desirable in themselves — these harlequin tucks that take so many forms, and appear in such differing phases. If only there were not so many of them! It is the whole fifty that weigh us down. One straw does not break the camel's back. It is the last one of many that breaks it.

The difficulty lies in learning just where to draw the line, which certainly must be drawn somewhere. Just what good thing is it that we should give up for the sake of having something better still? He or she who can satisfactorily answer this query will deserve the thanks of all womankind.

The question of household service grows year by year more perplexing and harder to solve. When one takes this fact into consideration and remembers that it is stated on good authority that three-fourths of the women in this country do their own work and that of the other fourth full one-half employ but one servant, how to make life more simple and easy seems a matter of the utmost importance. It is not a mere question of money. The having it or the lack of it does not settle the matter. There are many parts of the country in which anything like competent service cannot be obtained for love or money. Of the three-fourths above referred to, it is safe to say that at least one-half of them do *not* belong to the class that is content to be merely drudges. They, like their sisters, are fond of books, of art in so far as they know it, of beauty in all its forms. They long for leisure with all its golden possibilities.

But, in full accord with the spirit of our institutions, they are proud and ambitious — if not for themselves, yet for their children. And if there is one thing that the average American woman cannot calmly endure it is to be supposed ignorant of what is or is not "good form." Not that she uses that expression. She wishes it to be understood that she knows what it is "the thing" to do as well as her neighbor does. Shall she have hash — the hash of her grandmother, savory and toothsome, on her table when the last new cook-book ahashes that plebeian dish and exacts patties, croquettes and rissoles?

Perish the thought! If she break her back in the slow process of molding the refractory things into shape, or scorch her face frying them, the croquettes she will have if Madame La Mode so ordains, even though, if they told the plain truth, the chances are that not only she, but her husband, and her children, and the stranger within her gates would be forced to acknowledge that they decidedly preferred the hash.

Is not this servitude of the worst description,—to say nothing of the folly of it,—this spending of precious strength and golden hours in doing what in the long run does not add one iota to our own happiness, or to that of any other living being, merely because somebody regards it as “the thing” to do, or to have it?

Undoubtedly, whether one lives in city or country, it is well to follow, as far as one can without the sacrifice of higher things, the customs and usages of so-called polite society. As a rule they have at the bottom some wise foundation. But when we are gravely told by those who speak with authority that “self-respect” demands of us this or that,—the observance of the merest trifles as to the etiquette of table service, or of anything of a like nature,—is it not time to pause and to take a fresh start? The loss of self-respect is a terrible thing. Its preservation is so vital a point that it seems hardly wise to set up standards that are absolutely out of reach of the vast majority of American housewives and home-makers.

Is it certain that the new ways are always better, and wiser, and more refined than the old ways? Then again, have we not all read something about the folly of putting new wine into old bottles?

There is such a thing, alas! as losing all the strength and dignity out of a life by ill-considered attempts to change its current. The broad, full stream is apt to dwindle away in numberless small channels, and its power dwindles likewise. After men and women have gone much beyond the middle mile-stone, sudden changes as to style of living, household service, and the like are not apt to add greatly either to their dignity or to their happiness. In short, there are many conceivable circumstances under which one tack is infinitely better than fifty.

Julia C. R. Dorr.

“The Right Man for Our Church.”

ALTHOUGH some of the clerical abilities and accomplishments expected to be constantly in readiness at a moment's notice for the use of Christian congregations and the general public are to be found chiefly in the imaginations of inconsiderate and not over-intelligent laymen, the demand for them is none the less difficult to meet. As proved in the letters written by expectant committees, they sometimes mount up in number and variety till they reach the summit of absurdity. The professor of a theological seminary, receiving one of these epistles which enumerated the long and discouraging list of talents and requisites necessary in the character and attainments of one who should be fit for the pastorate of “our church,” replied to the committee to the effect that “we have no man now in this seminary such as you describe, and doubt if we ever had one.” Manners, dress, voice, elocution, public spirit, magnetic attraction for young people, wife, num-

ber of children, extravagance or parsimony in living, executive talent, interest in education and temperance, gracefulness at weddings, appropriateness of manner and speech at funerals—all these, besides those many qualifications which are really needed to make a good preacher, come in for a share of criticism, and form important factors in the layman's ideal of the clergyman he would like, or thinks he would like, as the pastor of his church.

It is here submitted, therefore, that in no other occupation is so much expected in things which are really non-essential to it. That a minister should be a good man, sound in the Christian faith, and an interesting and sensible preacher goes without saying. Every congregation should look for these things, and be thankful for all else that may chance to go with them; but is it not true that so much more than these is often demanded that it can truthfully be said that the follower of no other occupation is subjected to so many and so severe tests concerning matters which lie outside professional requirements? The carpenter, or plumber, or mason is simply required to do his work well; his opinions, and dress, and social powers, together with the qualities of his wife and the number of his family, are not subjects of public inquiry. We do not ask whether the lawyer has a pleasing voice, or the physician a becoming and stylish dress, or the architect a taking manner, or the army officer a charming wife, or the school-teacher a magnetic bearing in a drawing-room, although these may be desirable possessions: we ask whether the man understands his business in its essentials, is learned in its details, and skillful in the practice of it.

These demands made upon the ministerial profession are often more exacting among the less intelligent than among the educated, so that it is sometimes said in clerical circles that those who know the least concerning the long and laborious preparation required to fit men for the modern pulpit, and concerning the proper characteristics of a good preacher, are the most emphatic in their insistence on a great number and variety of qualifications in their minister. A small country church in Massachusetts, many years ago, criticised quite sharply the services of a man whom they supposed to be preaching for them as a candidate, and were much surprised afterwards to learn that he already occupied a position as pastor much more prominent and influential than they would have believed possible. I remember also a case where a small city congregation that had among its members scarcely a man that was even fairly well educated heard a man preach several Sabbaths. He was a graduate of a New England college and of one of the best of our theological seminaries, a man of good address, scholarly and gentlemanly in his pulpit manners, a careful, thoughtful sermonizer, and a fluent speaker. He was disliked; and when some of the chief men were questioned as to the cause of dissatisfaction, they replied, “He does n't have a commanding presence.” The readers of this letter will recall one of old of whom it was said that his bodily presence was weak and his speech contemptible; but they will be forced to admit that Paul was, after all, something of a preacher. This congregation in search of a “commanding presence” were a feeble folk, numerically and financially; and though the Lord's people, however poor and weak, ought, theoretically, to

have the very best in the way of spiritual food, yet as things are in the church, as well as in the world, it is a question whether they were wholly wise in looking for perfection in the Lord's vessel, and whether they were not too slow in appreciating the Lord's grace contained in it; and although ministers ought not to be rated by the amount of salary that they receive, still this incident will remind many of the man who said, concerning an underpaid servant girl, "You can't expect all the Christian virtues for two dollars a week."

In proof of the singular demands sometimes made upon the minister, not only for needful qualifications not looked for in other professions, but also for those which do not really form a part of the clergyman's necessary outfit for his work, I offer for perusal a letter written less than five years ago by a member of a church in one of the largest and oldest and—will it be believed?—most cultured of our American cities. It was written by one layman to another. The writer was a member of the "supply committee" appointed to "look for the right man" as pastor, and the epistle is one of inquiry into the fitness of a certain minister who had been recommended to him for the position. Leaving out dates and proper names and a single sentence, which might furnish a clue to identification, I give the letter *verbatim*, without correction of rhetoric, grammar, italics, or punctuation.

MR. ———.

MY DEAR SIR: I have this day read your letter directed to my friend Mr. relative to Rev. Mr. of My church relation is with church, chairman of the *committee* &c.—delegated to find just the man for church. We have enjoyed the opportunity in listening to several fine speakers—but very few of them are considered what is needed—or fitted for this pulpit and people,—a defect in *voice*—physique or mannerism. It requires a strong full rounded voice—to be heard in the auditorium of the sanctuary—we can seat 1200, & everybody must hear in our church. Our congregation during the time Dr. has been with us has averaged 700 or 800—We must have a man who has the make up *temporally & spiritually*, who will bring in 1300 & fill us to overflowing—Our church membership is 400—we want a membership not less than 1200—We think with God's help & the right man—who is a good seed sower, can do it—we have a good operative force—and there is material in abundance—needing to be *square-hewed & numbered* for the building. The streets are full of houses on both sides & there are to be found rough ashlers to be hammered—We need a master workman in the gospel.

Will you please give me the exact measurement of Mr. (confidentially if you say so) that is to say

Is he a man of deep piety? & yet a social & ready man—an original man? in thought & utterances—a real student of God—man & nature? Are his illustrations forcible & impressive? &c. &c. Does he use a manuscript? What is his salary? How much family?—where did he graduate, in Theology? How does he stand on the Andover question? &c, I am satisfied that some are born to be Teachers. If my request is granted and the reply is satisfactory I feel sure that some of our committee will go and listen to Mr.

Fraternally yours

These can hardly be termed modest demands. To say nothing of the requirement that the minister should draw a hundred more people than the church will accommodate, and also convert and make communicants of the exact twelve hundred which the church does accommodate, the particularity of some of these questions is certainly interesting. One wonders why the inventory did not include an inquiry as to the cut of collar or style of boots worn by the aspiring seeker

for a pulpit. As if a minister should be expected to tell a committee or a church what he thought of the complicated phases of the Andover matter; or was answerable to a church committee for the number of his children! But things still more singular are sometimes the subject of criticism. "We cannot allow a man to preach as a candidate here," said the shrewd deacon of a New England church. "He must be accepted on his record; for should he preach as a candidate, Dr. Blank might object to him on the ground of his lack of gracefulness in taking off his overcoat." Not long since, in an Eastern city, a candidate for a pastorate was rejected after being heard, and inquiry elicited the fact that one of the objections made to him was that he wore a "fly tie." No defense of this hapless seeker for a pastorate will be here attempted. Doubtless our brother was verily guilty in wearing a tie that fastened itself to the shirt button with a bit of rubber; but it ought to be said in partial extenuation of his offense that although he had not, like one of whom we have read, given his whole mind to his neck-tie, it might have been for the reason that he was somewhat preoccupied in the attention bestowed upon the spirituality and helpfulness of his sermon, and the appropriateness of his prayers.

When one considers the many different tastes and preferences to be found in a large modern congregation, and remembers that these tastes have reference so much more largely than in former years to external and non-essential matters, it will be readily apprehended by those outside the ministry that the business of "candidating" is admirably adapted to strike terror to the heart of a minister of ordinarily sensitive nerves. The radical idea of it is false to begin with. That idea is, when stated in plain words, that a church, by hearing a man preach for a single Sunday, can learn sufficiently of his character and abilities for the work of the ministry to decide off-hand whether he is the man they want, or rather, whether he is the man they need, to live with them and be their minister week after week and year after year. Suppose a great corporation should insist that its employment of a lawyer as its permanent solicitor should turn, not on his general record as a lawyer, but on the impression he made on the directors by the delivery of a single plea before a jury. Suppose a medical institution should allow its action in the appointment of a physician to a responsible place to be decided by the management and result of his practice in a single case of fever. The comparisons are not wholly false or inapt. In many respects the lawyer or the physician put to such a test would have the advantage of the minister. The deeper and more subtle qualities of character, the sources of power and influence, the secret fountains of social and spiritual strength which are so largely elements in the success of a pastor, might manifest themselves but faintly in a trial sermon. The candidate in many cases comes to the ordeal a complete stranger to the congregation; he is perhaps unaccustomed to the order of service, or the pulpit is not of the proper height, or he is not as well as usual—has taken a cold on the long journey made to keep this appointment, or is suffering from headache. Any one of these may seriously affect a preacher, especially in our non-liturgical churches, where so much depends upon the personal appearance of the speaker; and on a critical occasion like this, where success is likely to turn on appearances, a seemingly

insignificant circumstance may disconcert a sensitive man and unfit him for his work. A slight physical ailment, or the unaccountable loss of the preaching mood which sometimes afflicts a minister of nervous temperament, may cripple the mental energies and so abate that vigor and alertness of mind which are necessary to the proper outfit of the preacher for his work, especially where much of that work is extemporaneous, that he may fail to show his real power as a preacher. The choice of a theme is difficult at such a time, and may be unfortunate for that particular congregation or that particular time, on account of certain local circumstances of which the preacher is ignorant; or it may fail to give a proper idea of the average range and kind of his usual discourse. But he is here, and he must be heard. No matter what the drawbacks, he must preach; and preach as a man to whom the assembly is looking as their possible pastor. He must make his "impression," and the action of the parish is to turn on that impression.

To a sensitive man, the whole business is repulsive; to a man with a fine moral sense, there is a certain feeling of the insincerity of it. It seems to him as much a "performance" as the solo of the gallery singer is sometimes said to be. He is here professedly to preach the gospel and to do good to the souls of men; he is here really to show these people how gracefully and impressively and eloquently he can do it. The whole business carries a hollow and unreal look. He feels instinctively that comparatively few will be impressed by the depth, beauty, truth, sweetness, or soundness—if such there be—of his discourse, or by the simplicity and reverence of feeling in his prayers; and that the large proportion of the assembly will be thinking of the manner rather than the matter, of form rather than substance. His face attracts one, his voice another, his pathetic tones another, his "manner" another, his comments on the Scripture another, his undemonstrative method another. But other people are repelled by the same things. A ministry of months and years might correct these bad impressions and confirm the good ones; but the minister is here for only one Sunday and then flits to other fields, to pass through the same ordeal. The "impression" must necessarily be imperfect as a correct idea of what the candidate is as a preacher and pastor. Moreover, the minds of all being so largely engaged in taking what strikes the eye and makes a temporary impression on the ear, the service as a religious service is a failure. It is not a service sincerely conducted by one unconscious of himself and aiming at spiritual effect alone, nor one in which the hearers heartily enter, or can heartily enter, with the simple desire that they may worship God, and receive thereby spiritual benefit to themselves. The obvious conclusion is, that the more refined or sensitive the man is who submits to this ordeal, the more likely will he be *not to do* his best, or *be* his best. He will find more difficulty than some other men of less refinement of character, because he will be more conscious of the false and unreal position which he has allowed himself to fill. The practice must be more or less demoralizing to a church that Sunday after Sunday keeps up this business of listening to candidates, and it must be more or less debasing to the ministers who accept invitations to enter into the arrangement.

If this letter shall awaken the desire of any to seek some more reasonable plan of securing pastors for our churches, following out perhaps the excellent suggestions offered by Dr. Gladden in a recent number of *THE CENTURY*, its purpose will be fulfilled. At any rate it can do no harm to call attention to the immoderate desires and expectations of laymen in their search for imaginary and impossible ministers, and to that emphasis which they too often lay upon tests and qualifications which are not really necessary to a faithful and successful ministry.

Forrest F. Emerson.

NEWPORT, R. I.

"Aunt Martha" Grayson.

IT seems to me fitting to the story of "The Graysons" to publish a little incident connected with "Aunt Martha" that came under my personal observation.

The incident of which I speak occurred when Lincoln and Douglas were making their famous tour of Illinois, and were to speak at Havana, Mason County, Illinois.

About 6 o'clock on the day previous there came to the house of the friend with whom I was stopping an old lady who had walked I do not know how many miles to see "dear Old Abe." She wore a calico sun-bonnet and a clean dark calico dress of rather scant proportions and was toil-worn and withered, but withal had such a kindly face that one forgot her homely attire and backwoods manners.

She talked incessantly of Mr. Lincoln, always calling him "Old Abe," and was so eager and trembling in her desire to see him that I could not help wondering what possible interest she could have in him, or he in her. I learned that Lincoln, years before, had saved the life of her son, who was accused of murder, and no scrap of evidence seemed possible to save him from the gallows. Here, then, was the mother of the young man whose story I had so often heard.

The next morning the old lady was up long before the rest of us, nervously roaming about, and scarcely able to control her agitation. "I am going to be the first to greet 'Old Abe' when he leaves the boat," she said over and over again; "and I want to tell him how glad I am that he has become so great."

She did not wait for the steam-whistle to herald his coming. With trembling fingers she tied the strings of her sun-bonnet under her chin, lighted her pipe,—I'm sure I'm not mistaken in this,—and hurried nervously away, saying as she left, "I must be the first to take him by the hand." And sure enough she was. The whistle blew, the crowd surged down to the landing, but the old lady was already there. No sooner was the plank thrown out than "Aunt Martha" stepped upon it, and was indeed the first to meet and greet "Old Abe."

She came back to the house shortly after, her face radiant with joy, the tears still coursing down her withered cheeks, and cried out between intervals of hysterical sobs: "I've seen him—he was not ashamed of me—he took my old hand and wrung it with a will, saying, 'Howdy, Aunt Martha? How are all the folks? I'm right glad to see you.'"

CLEVELAND, OHIO.

Lord Bacon and the Vail Telegraphic Code.

IN the April number of *THE CENTURY* Mr. Pope, in his article on "The American Inventors of the Telegraph," claims for Mr. Vail the "conception of an alphabetical code, based on the elements of time and space."

Without desiring to detract in the slightest from Mr. Vail's credit as an inventor, and admitting that this conception and its realization were with him original, he was not, in the language of patents, the first, as well as the original, inventor of this conception.

Bacon, in the first chapter of the Sixth Book of "*De Augmentis Scientiarum*" refers to a "contrivance" of a cipher which he "devised himself when he was at Paris in his early youth, and which he still thinks worthy of preservation." It is what he calls "an alphabet of two letters"; and though he transposes these two letters through five spaces to form the twenty-four letters of our alphabet then in common use (I and J and U and V not being discriminated), he adds this remarkable paragraph:

"Nor is it a slight thing which is thus by the way effected, for hence we see how thoughts may be communicated at any distance of space, by means of any objects perceptible, either to the eye or ear, provided *only that those objects are capable of two differences*; as by bells, trumpets, torches, gun shots, and the like."

I think I justly call this paragraph remarkable, in view of the development of this idea which has since taken place. The Vail alphabet for the telegraph, the signaling by flashes of light, the sounding upon whistles and bells, and the daily discovery of "some new field of usefulness for this universal symbolic language" to which Mr. Pope refers are, almost in terms, set out by Bacon in this paragraph.

How much older than Bacon this method of alphabetic distinction is I cannot say. Perhaps if Wendell Phillips were alive he would trace it back to the Greeks, or to the Phenicians, and then say that the name of the Egyptian from whom they got it was long since forgotten.

WASHINGTON, D. C.

BRIC-À-BRAC.

Torm.

D'E'R law! Sis' Jane, ef dat ain't you!
Come in an' tek a cheer;
I ain't sot eyes upon yo' face
Sence hawg-killin' time las' year.
Lemme dus' it wid my ap'on, 'kase
I 's 'feard yo' 'll spile yo' dress;
We 's kinder late dis mornin', an'
T'ings is all in a mess.

Heah, Jim! bring mammy a tu'n er wood
(Yo' dad des sont a load).
Lize! fetch some water from de spring—
(Nigger, doan' brek dat gode!.)
How 's all yo' folks? Well? Dat is good;
An' we all des is prime.
I 'm gwine to tell yo' 'bout Torm's gal
Ef yo' 'll des gimme time.

Yer see, Torm 's gone an' 'gage' heself
Ter a likely gal—but min',
She ain't no yaller nigger, mun!
She 's de molliglassy * kine,
Des 'bout de culler ob gingerbread—
Sis' Jane! whot 's de motter wid you!
Yo' face 'bout as long as two o' my arms,
An' yo' lips is fa'rly blue.

How 's Torm, yo' say, Sis' Jane? How 's Torm?
Why, my Torm, he 's all right;

He went to see his Sylvic walk
De cake-walk des las' night—
Bad news? I spec dat shot o' mine
Done hang in de bobby cuet fence;
Lize druv him out a while ago,
An' he hain't nuvver come back sence.

Bad news 'bout Torm? Go 'way, Sis' Jane!
'T ain' nothin' happen to Torm;
He 's haulin' railroad sills to-day
Down on ole marster's farm.
De railroad!—dat wuz hit, yer say?—
De railroad danejus place?—
Tell me de Gospel troof, Sis' Jane!
I sees death in yo' face.

De train come tyarrin' 'long, yer say,
An' Torm cyarn't hol' de hoss;
De injine shriek so furious dat
He r'ar, an' pitch, an' toss,
An' th'ow Torm out, an' den de wheels
Des strek him on de hade?
An' now you 's tryin' ter splain ter me
Dat my boy Torm—is dade?

'T ain' while to tell me dat, Sis' Jane!
Torm cudden't die 'fore me.
Heish! what 's dat rumblin' 'long de road?
Dey 's bringin' him—home—ter me?
Lawd Jesus! come hyar to me now,
An' tell me what I done!
De Lawd hab mussy upon me!
O Torm! my son, my son!

Ballade of Beseeching.

(TO MR. A-ST-N D-B-S-N.)

"Virelais, ballades, and verses vain." SPENSER.

BALLADE, quatorzain too, we know.
 We know rondeau and triolet.
 We 've turned a villanelle or so,
 And even the pantoum we have met.
 Sestines we conned (but did not get
 Much pleasure from them, we must say);
 But this one thing escapes us yet —
 Pray tell us what 's a *virelai*.

The rondel's mazes to and fro
 We trod, lost there as in a net.
 The chant-royal essayed — but oh,
 We left it, half way, in a pet:
 It *cannot* be "cast in one jet";
 We like, beside, a thing more gay,
 Less like some stately minuet.
 Pray tell us *what* 's a *virelai*.

'T is now too late to school to go
 To study French — the alphabet
 Of parley-voo, that language *beau*,
 We never learned, to our regret,
 Else even that task ourselves we 'd set.
 Alas, is there *no* other way?
 Our flesh we 're losing from the fret!
 Pray tell us what 's a *virelai*.

ENVOY.

Poet, of gratitude our debt
 Is greater, now, than we can pay;
 But still we sue (with eyes tear-wet) —
 "Pray tell us what 's a *virelai*!"

Alice Williams Brotherton.

Little Mamma.

WHY is it the children don't love me
 As they do mamma?
 That they put her ever above me —
 "Little mamma?"
 I'm sure I do all that I can do.
 What more can a rather big man do,
 Who can't be mamma —
 Little mamma?

Any game that the tyrants suggest,
 "Logomachy," — which I detest, —
 Doll-babies, hop-scotch, or base-ball,
 I'm always on hand at the call.
 When Noah and the others embark,
 I'm the elephant saved in the ark.
 I creep, and I climb, and I crawl —
 By turns am the animals all.

For the show on the stair
 I'm always the bear,
 The chimpanzee, or the kangaroo.
 It is never, "Mamma, —
 Little mamma, —
 Won't you?"

My umbrella's the pony, if any —
 None ride on mamma's parasol;
 I'm supposed to have always the penny
 For bon-bons, and beggars, and all.
 My room is the one where they clatter —
 Am I reading, or writing, what matter!

My knee is the one for a trot,
 My foot is the stirrup for Dot.
 If his fractions get into a snarl
 Who straightens the tangles for Karl?
 Who bounds Massachusetts and Maine,
 And tries to bound flimsy old Spain?

Why,
 It is I,
 Papa, —
 Not little mamma!

That the youngsters are ingrates don't say.
 I think they love me — in a way —
 As one does the old clock on the stair, —
 Any curious, cumbrous affair
 That one's used to having about,
 And would feel rather lonely without.
 I think that they love me, I say,
 In a sort of tolerant way;
 But it's plain that papa
 Is n't little mamma.

Thus when shadows come stealing anear,
 And things in the firelight look queer;
 When shadows the play-room enwrap,
 They never climb into my lap
 And toy with *my* head, smooth and bare,
 As they do with mamma's shining hair;
 Nor feel round my throat and my chin
 For dimples to put fingers in;
 Nor lock my neck in a loving vise
 And say they 're "mousies" — that 's mice —
 And will nibble my ears,
 Will nibble and bite
 With their little mice-teeth, so sharp and so white,
 If I do not kiss them this very minute —
 Don't-wait-a-bit-but-at-once-begin-it. —
 Dear little papa!
 That 's what they say and do to mamma.

If, mildly hinting, I quietly say that
 Kissing 's a game that more can play at,
 They turn up at once those innocent eyes
 And I suddenly learn to my great surprise
 That my face has "prickles" —
 My mustache tickles.
 If storming their camp I seize a pert shaver,
 And take as a right what was asked as a favor,
 It is, "O Papa,
 How horrid you are —
 You taste exactly like a cigar!"

But though the rebels protest and pout,
 And make a pretense of driving me out,
 I hold, after all, the main redoubt, —
 Not by force of arms nor the force of will,
 But the power of love, which is mightier still.
 And very deep in their hearts, I know,
 Under the saucy and petulant "Oh,"
 The doubtful "Yes," or the naughty "No,"
 They love papa.

And down in the heart that no one sees,
 Where I hold my feasts and my jubilees,
 I know that I would not abate one jot
 Of the love that is held by my little Dot
 Or my great big boy for their little mamma,
 Though out in the cold it crowded papa.
 I would not abate it the tiniest whit,
 And I am not jealous the least little bit;
 For I 'll tell you a secret: Come, my dears,
 And I 'll whisper it — right-into-your-ears —
 I too love mamma,
 Little mamma!

Charles Henry Webb.
